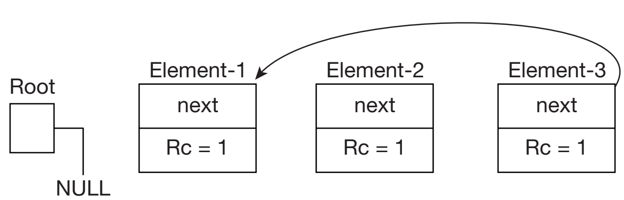
References counting garbage collector works in an 'incremental' fashion. Choice (C)

19. The reference count of an object holds a value which specifies the number of objects referencing that object.
If root is made as "NULL : THEN:

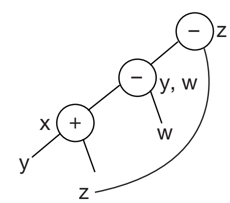


∴ (i) is correct
But References counting garbage collector cannot consider these elements as garbage (∴ their Reference counts is not zero).
∴ (ii) is false. Choice (A)

20. Choice (D)

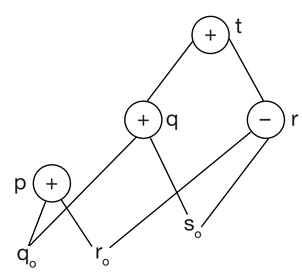
21. Let us see what will happen when 'a' is executed. First 'a' calls 'c', so we place an activation record for 'c' above that for 'a' on the stack. The access link for 'c' points to the record for 'a', since 'c' is defined immediately within 'a'. Then 'c' calls $b(d)$.
'c' knows about 'd', since 'd' is defined within 'c' and therefore 'c' passes a pointer to its own activation record as the access link. Choice (C)

22. Given block
$x = y + z$
$y = x - w$
$z = y + z$
$w = x - w$



Number of non-leaf nodes = 3 Choice (B)

23. Given block,
$p = q + r$
$q = q + s$
$r = r - s$
$t = q + r$
This block calculates '$q + r$' two times but both times The sum '$q + r$' is same. But the DAG does not consider this issue.
$(t = q + r = (q + s) + (r - s) = q + r)$
The DAG of given code will be



Number of non-leaf nodes = 4 Choice (B)

24. $R_0 \leftarrow c$
$R_1 \leftarrow d$
$R_0 \leftarrow R_0 + R_1$
$R_1 \leftarrow f$

$R_2 \leftarrow g$
$R_1 \leftarrow R_1 + R_2$
$R_1 \leftarrow -R_1$
$R_0 \leftarrow R_0 - R_1$
$\therefore$ 3 registers required.

Choice (C)

25. The CFG for given problem is

$$S \rightarrow Sa|Sb|Sc|a|b|c$$

This grammar parses any string in left-skewed manner. i.e., grammar is left-recursive. Lets take three synthesized attributes for the non-terminal symbol S, namely n_1, n_2, n_3. n_1 will capture the number of a's to the left of a given c, n_2 will count the number of a's to the right of given 'c' character and n_3 will accumulate the total number of substrings. Here we need to count the number of a's to the left of a 'c' character and to the right of that character so that we can add the value of n_1 to a running total for each occurrences of a 'b' character to the right of 'c' which recording the value of a's to the right of 'c' so that when we find a new 'c', we copy the value of the a's that were to the right of the first 'c' and which are now to the left of the second 'c'.
Hence, the resultant grammar is Choice (A).

Choice (A)

Theory of Computation and Compiler Design Test 3

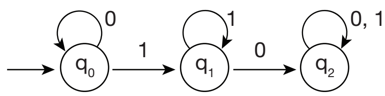
Number of Questions: 35 **Section Marks: 30**

Directions for questions 1 to 35: Select the correct alternative from the given choices.

1. Which of the following is not a feature of 'Deterministic Finite Automata'?
   (A) Finite set of states
   (B) Finite set of input symbols
   (C) Any number of start states
   (D) A set of final states
2. Which language is accepted by an NFA?
   (A) Regular languages
   (B) Superset of Regular languages.
   (C) Proper subset of Regular languages.
   (D) Context free languages
3. Which of the following has the power to be in several states at once?
   (i) DFA (ii) NFA
   (A) (i) only (B) (ii) only
   (C) Both (i) and (ii) (D) Neither (i) nor (ii)
4. In which of the following terms DFA and NFA will differ?
   (i) Set of states (ii) Set of inputs
   (iii) Start state (iv) Set of final states
   (v) Transition function
   (A) (iii), (iv) (B) (iii), (iv), (v)
   (C) (i), (iii), (v) (D) (v) only
5. Which of the following is FALSE for a transition function of NFA?
   (A) It takes a state from a finite set of states as an argument.
   (B) It takes an input symbol from a finite set of inputs as an argument.
   (C) It returns a subset of states.
   (D) It returns a state.
6. Which of the following is FALSE?
   (A) A language L is accepted by some DFA if L is accepted by some NFA.
   (B) An NFA with n states will have an equivalent DFA with 2^n states.
   (C) NFA and DFA have equal expressing capability.
   (D) $\in$-NFA has more expressing capability than NFA.
7. What are the equivalent sets of ϕ^* and ϕ^0 respectively?
   (A) $\{\in\}, \{\in\}$ (B) $\{\in\}, \phi$
   (C) $\phi, \{\in\}$ (D) ϕ, ϕ
8. Let L be the language is defined over $L = \{0, 1\}$ then, L* =
   (A) $\{\in\}$
   (B) $\{0, 1\}$
   (C) $\{\in, 0, 1, 00, 11, 01, 10, ...\}$
   (D) $\{0, 1, 00, 11, 01, 10, ...\}$
9. While scanning the input string, all the constants stored in the following Data structure?
   (A) Symbol Table (B) Terminal Table
   (C) Numeric Table (D) Literal Table
10. Eliminating left recursion results
    (A) in converting a non LL(1) grammar to LL(1) grammar.
    (B) in nonretainment of left associativity.
    (C) in comparatively easy implementation
    (D) may fall in to infinite loop.
11. Which one of the following parser does not require intelligence to parse string?
    (A) RDP
    (B) Brute Force Technique
    (C) Table driven parser
    (D) Operator precedence parser
12. In the Parsing of a string 'w' using LL(1) parsing algorithm, Top of stack contains a terminal and Look ahead symbol is same as Top of stack, then which of the following action is performed?
    (A) successfull completion
    (B) pop of stack
    (C) increment input pointer
    (D) pop of stack and increment input pointer
13. Which of the following statement is false about LL(1)?
    (A) An ambiguous grammar is not LL(1)
    (B) Left factored grammar is not LL(1).
    (C) Left recursive grammar is not LL(1)
    (D) In a grammar 'G', if every non-Terminal if produces only one production then G is not in LL(1).
14. Which of the following statement is false?
    (A) Bottom up parsing uses Reverse Right most derivation.
    (B) Bottom up parsing uses canonical reduction sequence.
    (C) Top down parsing uses Left most derivation.
    (D) Top down parsing uses canonical Left sentential form.
15. Which of the following statement is false?
    (A) CLR is most widely used parser
    (B) Size of SLR(1), LALR(1) and CLR(1) parsers may or may not be equal.
    (C) Go to and shift action of LR(0), SLR(1) and LALR(1) must be equal.
    (D) LALR(1) parser is most widely used parser.
16. Consider the DFA which accepts L = {w/w is of the form $x10y$ for some strings x and y consisting of 0's and 1's only}.
    Which of the following strings are not accepted by given DFA?

(i) 01 (ii) 11010
(iii) 100011 (iv) $\in$
(A) (i), (ii) (B) (i), (ii), (iv)
(C) (i), (iv) (D) (i), (ii), (iii), (iv)

17. Consider below DFA:

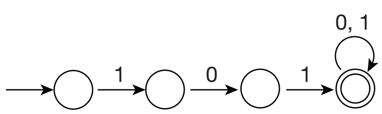


What is the language accepted by given DFA?
(A) All strings which ends with either '0' or '1' only.
(B) All strings which ends with '0' only.
(C) All strings which has the substring '10'.
(D) All strings which has the substring '110'.

18. Which of the following DFA accepts all the even length strings on {0, 1}?

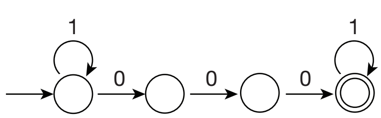
(A) 
(B) 
(C) 
(D) All the above

19. Consider below DFA:



What is the language accepted by above DFA?
(A) All the strings which contain '101' as substring.
(B) All the strings which begin with '101'.
(C) All the strings which ends with either '0' or '1'.
(D) All the strings which do not contain the substring '00'.

20. Which of the following regular expression represents below DFA?



(A) 1*0001* (B) 1* + 000 + 1*
(C) 1* + 0 + 0 + 0 + 1* (D) (10001)*

21. What is the language accepted by the transition table of a DFA given below:

δ	A	B
Q_0	Q_1	Q_0
Q_1	Q_0	Q_1

(A) All the strings which do not have even length.
(B) All the strings which have at least one a.
(C) All the strings with even numbers of a's.
(D) All the strings with odd number of a's.

22. Consider below transition table of a DFA with some blanks:

δ	0	1
q_0	–	q_0
q_1	–	–
q_2	q_2	q_2

What are the missing transitions if the DFA accepts all the strings with '00' as substring?
(A) $q_0 \xrightarrow{0} q_1, q_1 \xrightarrow{0} q_2, q_1 \xrightarrow{0} q_0$
(B) $q_0 \xrightarrow{0} q_1, q_1 \xrightarrow{1} q_2$
(C) $q_0 \xrightarrow{0} q_1, q_1 \xrightarrow{0} q_2, q_0 \xrightarrow{1} q_0$
(D) $q_0 \xrightarrow{0} q_1, q_1 \xrightarrow{0} q_2$

23. Let R and S be two regular expressions then which of the following is not a regular expression?
(A) $R + S$ (B) RS
(C) R^* (D) None of the above

24. What is the regular expression for the language over {0, 1}, which accepts the set of all strings that begin with '110'?
(A) 110 (10)* (B) 110 (01)*
(C) 110 (1 + 0)* (D) 110^+ (1 + 0)*

25. Give a regular expression for the language over {0} which accepts the set of all strings of odd number of 0's?
(A) 0* (B) 0^+
(C) 0(00)* (D) 0 + (00)*

26. Lexical Analyzer uses which one of the following pattern (Lexer) to generate tokens?
(A) Regular expression + Priorities + Longest Matching Token rule.
(B) Regular Expression + priorities + Shortest Matching token rule.
(C) Regular Expression + longest Matching Token rule
(D) Regular Expression + Shortest Matching token rule.

27. Consider the following code segment. If C compiler compiles the code, what will be the response?

```
#include <stdio.h>
main( )
{
/* this is My first program*/
int a, b, c;
/* initializing variables
/* a = 10, b = 20 */ compute c value
   */
c = a + b;
printf("%d", c);
}
```

(A) No error, produces object code.
(B) Run time error but No compile time error.
(C) syntax error but No Lexical error.
(D) None of the above.

28. Find the Number of Tokens in following C code

```
main ( )
{
int a, b;
a = 1; b = 0;
if (!a! = b)
a << = 1;
else
b >> = 2;
}
```

(A) 36 (B) 38
(C) 39 (D) lexical error

29. Regular Expression for identifier is $L(L \cup N)^*$: Here L-Letter and N-number, and some keywords in a language are {int, float, main, double, ...}. Then a string "int" is given to scanner how many strings or sub strings satisfies the patterns of Lexical Analyzer?

(A) 3 (B) 4
(C) 1 (D) None of the above

30. Consider the following statements about function and Token, when it is recognized during scanning.
(i) it produces Token value.
(ii) put identifier in symbol table.
(iii) increment line number
(iv) get next line and input to scan
Which of the following is true?

(A) (i), (ii), (iv) (B) (ii) and (iv)
(C) (ii), (iii) and (iv) (D) (i), (ii), (iii), (iv)

31. Time complexity of a parser that works for any unambiguous grammar where 'n' is the length of the input is:

(A) $O(n)$ (B) $O(n^2)$
(C) $O(n^3)$ (D) $O(n \log n)$

32. While parsing a string $w = abcd$ using Bottom-up parsing, what are the possible strings or sub strings that can be considered?

(A) $\{a, bc, cd, d, bcd\}$ (B) $\{a, ab, abcd, bd\}$
(C) $\{b, c, ac, bd, dc\}$ (D) $\{d, dc, dcb, dcba\}$

33. Consider the following grammar:

$S \to \text{aABe}$

$A \to \frac{Abc}{b}$

$B \to d$

Which of the following is the correct sequence of handles to parse a string $w = abbcde$?

(A) $\{aABc, d, Abc, b\}$ (B) $\{b, d, Abc, aABc\}$
(C) $\{d, b, Abc, aABc\}$ (D) $\{b, Abc, d, aABc\}$

34. Which of the following statement is false?

(A) $\text{LALR}(1) \subseteq \text{LR}(1)$ (B) $\text{LL}(1) \subseteq \text{LALR}(1)$
(C) $\text{LL}(0) \subseteq \text{LR}(0)$ (D) $\text{LL}(K) \subseteq \text{LR}(K)$

35. Consider the following grammar:

$S \to Aa/b$

$A \to Bc/d/aA$

$B \to Sb/c/Bd$

Which one of the following statement is false?

(A) S has indirect Left recursion.
(B) All non terminals have indirect Left recursion.
(C) S, A have immediate Left Recursion.
(D) B has immediate and indirect left Recursion.

Answer Keys

Hints and Explanations

1. A DFA will have finite states, inputs, transition function, a start state & a set of final states. Choice (C)

2. NFA's accept exactly the regular languages, same as DFA's. Choice (A)

3. NFA's have the power to be in several states at once (Because of the non determinism). Choice (B)

4. DFA & NFA will differ only in their transition function. Choice (D)

5. The transition function of NFA will take a state, an input symbol and returns a set of states. Choice (D)

6. DFA = NFA = $\in$ – NFA. Choice (D)

7. Choice (A)

8. L^* (kleen closure) of a language L represents the set of those strings that can be formed by taking any number of strings from L, possibly with repetitions and concatenating all of them. Choice (C)

9. Symbol Table mainly maintains record for identifiers, all constants and all type of literals are stored in Literal Table. Choice (D)

10. Left recursive grammars are easy to implement (compare to a grammar after eliminating Left Recursion). Choice (C)

11. Brute Force Technique 'blindly' substitutes first production; no intelligence is required. Choice (B)

12. In LL(1) parsing Algorithm 'a' is look ahead symbol, X is the top of the stack, then, if $a = X \neq \$$ pop of stack and increment input pointer. Choice (D)

13. A grammar is said to be LL(1) if each and every cell contains at most one production. If every non-terminal is deriving only one production there is no chance of occurrence of two productions in one cell.

Choice (D)

14. Top-down parsers uses LMD. Bottom up parser uses Reverse RMD. Reverse Right most derivation is also called canonical reduction sequence. Choice (D)

15. CLR(1) is most powerful parser.
LALR(1) is most widely used parser as it requires Less space compared to CLR(1) Choice (A)

16. 'L' must contain the substring '10'.
(i) is not accepted
(ii) accepted
(iii) accepted
(iv) not accepted

Choice (C)

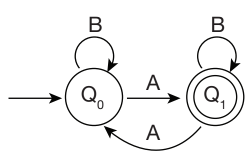
17. Given DFA accepts all the strings which have the substring '10'. The strings accepted are 10, 010, 110, ... Choice (C)

18. The even length strings on {0, 1} are ∈, 00, 11, 01, 10, 0011, 0101, 1100, ... only choice (A) accepts all these strings. Choice (A)

19. Given DFA accepts all the strings which begin with '101' only. It won't accept 0101; it accepts 10100. Choice (B)

20. Given DFA accepts all the strings with exactly three consecutive zeros. Choice (A)

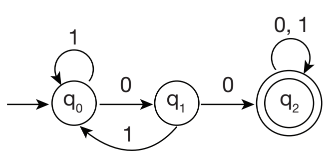
21. The DFA for given transition table is given below:



It can have any number of b's but the number of a's must be odd {a, aaa, $aaaaa$, ...}.

Choice (D)

22. The DFA for given partial transition table is:



If it accepts all the strings which have '00' as substring, $q_0 \to q_1$, $q_1 \to q_2$ must have '0' transition. After one '0' there is a possibility of 1's so put a '1' transition from q_1 to q_0. Choice (C)

23. $R + S$ contains union of $L(R)$ and $L(S)$. RS contains concatenation of $L(R)$ and $L(S)$. R^* is closure of R.

Choice (D)

24. The strings of the language L must start with '110' after that there may be any number of 0's and 1's, so the regular expression is 110 (1 + 0)*.

Choice (C)

25. 0* accepts zero or more number of 0's.
0^+ accepts one or more number of 0's.
0(00)* accepts 0, 000, 00000, ... i.e., odd number of zeros.
0 + (00)* accepts either 0 or 00 or 000, ...

Choice (C)

26. Ex : identifier L(LUT)*
int ab;
'a' is satisfying Regular Expression but it won't be treated as Lexeme. Longest matching string will be treated as Lexeme, 'ab' is Lexeme.

Choice (A)

27. There is only Lexical Error because of Nested comments. Choice (D)

28.
```
main/ (/) /
{/int/a/,/b/;/
a/=/1/;/b/=/0/;/
if/(/!/a/! =/b/)/
a/<</=/1/;/
else/
b/>>/=/2/;/
}/
```
∴ Total 36 Tokens. Choice (A)

29. Lexical Analysis scans the input string character by char acter and checks each and every substring matching with the pattern but using lexer definition it takes longest matching string as Lexeme.
i → L(LUN)*
in → L(LUN)*
int → L(LUN)*
keywords (priority high) Choice (B)

30. Whenever a Token is generated it produces a value. If it is an identifier a record is created in symbol table. A hidden token is created for every read.

Choice (D)

31. If string length is 'n' then any parser for unambiguous grammar takes $O(n^3)$ time. Choice (C)

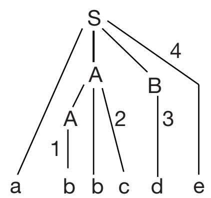
32. In bottom-up Parsing, when scanning a string for identifying handles, it considers all prefixes and suffixes of strings.

for *abcd*,

Prefixes	Suffixes
a	*d*
ab	*cd*
abc	*bcd*
abcd	*abcd*

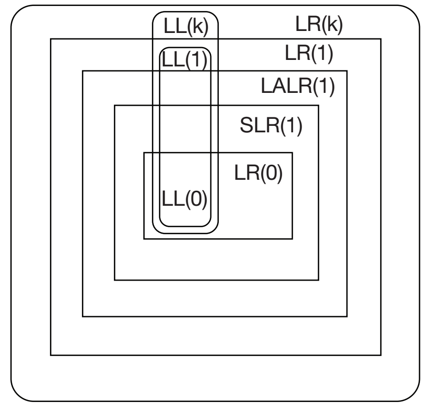
will be considered for handles Choice (A)

33.



$A \to b$
$A \to Abc$
$B \to d$
$S \to aABc$ Choice (D)

34. LL(1) $\subseteq$ LR(1)



Choice (B)

35. $S \Rightarrow Aa \Rightarrow Bca \Rightarrow Sbca$
$A \Rightarrow Bc \Rightarrow Sbc \Rightarrow Aabc$
$B \Rightarrow Bd$ (immediate)
$B \Rightarrow Sb \Rightarrow Aab \Rightarrow Bcab$ (indirect) Choice (B)

Theory of Computation and Compiler Design Test 4

Number of Questions: 35 **Section Marks: 30**

Directions for questions 1 to 35: Select the correct alternative from the given choices.

1. Which of the following is FALSE for regular expressions L, M and N?
(A) $L + M = M + L$
(B) $(L + M) + N = L + (M + N)$
(C) $(LM)\ N = (LM)\ N$
(D) $LM = ML$

2. Which of the following does not hold for two regular expressions R and S?
(A) $(R^*)^* = R^*$
(B) $(\in + R)^* = R^*$
(C) $(R^*S^*)^* = (R + S)^*$
(D) None of the above

3. Which of the following language is not regular?
(i) $(0 + 1)^*$
(ii) Palindromes over $\{0, 1\}$
(iii) $\{0^n10^n/n \geq 1\}$
(A) (i), (ii), (iii) (B) (i), (iii)
(C) (ii), (iii) (D) (iii) only

4. Identify the regular languages from the following:
(i) Set of strings of balanced parentheses
(ii) $\{0^n/n$ is a perfect square$\}$
(iii) $\{ww/w \in \{0, 1\}^*\}$
(A) (i), (ii) (B) (ii), (iii)
(C) (i), (iii) (D) None of these

5. Which of the following properties hold for regular languages?
(A) Complement (B) Difference
(C) Reversal (D) All the above

6. Which of the following is TRUE?
(A) Pushdown automata has same expressing power as Deterministic finite automata.
(B) NFA is an extension of pushdown automata.
(C) Pushdown automata is an extension of $\in$-NFA.
(D) PDA does not have any storage component.

7. Which type of language is accepted by DPDA?
(A) Regular languages only
(B) Context free languages only
(C) The class of languages between regular languages and context free languages.
(D) Recursively enumerable languages only

8. Which of the following statement is TRUE about Top down parsing and bottom up parsing?
(A) Bottom up parser is more powerful.
(B) Error detection in Top down parser is easy.
(C) Table size in Bottom up parser and Top down parser is approximately equal.
(D) Design complexity of Top down parser and Bottom up parser are same.

9. Limitation of L-Attributed Grammar is:
(A) uses only inherited Attributes.
(B) each inherited attribute inherits either from parent or Left side sibling
(C) each inherit attribute inherits either from parent or right side sibling
(D) each inherit attribute inherits either from parent or Left side sub tree.

10. Which of the following statement is false?
(A) It is always possible to rewrite a SDD to use only synthesized attributes.
(B) Evolution of L-Attributed grammar is BUP (Bottom up parsing)
(C) Evolution of S-Attribute grammar is BUP (Bottom up parsing)
(D) Evolution of L-Attributed grammar is Depth first. Traversal, left to right.

11. A grammar is said to be ‘attribute grammar’ if and only if it has
(A) L-Attribute definition
(B) S-Attribute definition
(C) SDT which does not have any side effects
(D) SDT which must have side effects

12. Which of the following statement is FALSE about L-Attributed definition?
(A) Traverse the parse tree in Breadth first manner from Left to Right.
(B) Evaluate inherited attributes if the node is visited for first time.
(C) Evaluate synthesized attributes if the node is visited for Last time.
(D) None of the above.

13. Which of the following is not an advantage of reverse polish notation?
(A) no rules of precedences
(B) no associativity
(C) no parenthesis
(D) not low level representation

14. A single tape Turing machine M has two states q_0 and q_1, of which q_0 is the starting state. The tape alphabet of M is $\{0, 1, B\}$ and its input alphabet is $\{0, 1\}$, the symbol B is the blank symbol used to indicate end of an input string. The transition function of M is described in the following table.

	0	1	B
q_0	q_1, 1, R	q_1, 0, R	q_1, B, L
q_1	q_0, 1, R	q_0, 0, R	Halt

Which of the following statements is TRUE about M?
(A) M accepts all strings that end with 0 only
(B) M accepts all strings that end with 1 only

(C) M accepts all strings of $(0 + 1)^+$ only.
(D) M accepts all strings of $(0 + 1)^*\ 01\ (0 + 1)^* + 1^*\ 0^*$

15. Which phase is most important for complex parts of any modern compiler?
(A) Syntax Analysis (B) Semantic Analysis
(C) Target code generator (D) Code optimizer

16. Match the following:

Regular expression	Finite Automata
(i) $R + S$	(A) (ii) RS	(B) (iii) R^*	(C) 
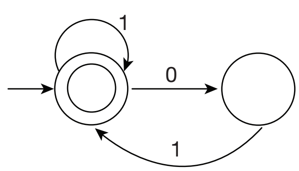
(A) (i)–(C), (ii)–(B), (iii)–(A)
(B) (i)–(A), (ii)–(B), (iii)–(C)
(C) (i)–(C), (ii)–(A), (iii)–(B)
(D) (i)–(B), (ii)–(A), (iii)–(C)

17. Consider below DFA:



What is the language accepted by this DFA?
(A) $1^* + (01)^*$ (B) $[1^*\ (01)^*]^*$
(C) $(1 + 01)^*$ (D) Both (B) and (C)

18. Consider the grammar:
$S \to AS/\in$
$A \to aa/ab/ba/bb$
What is the language generated by this grammar?
(A) Generates all the strings of the form $\{a^nb^n/n \geq 0\}$
(B) Generates all the strings of even length.
(C) Generates all the strings of equal number of a's and b's.
(D) Generates all the strings possible with $\{a, b\}^*$.

19. Which of the following is not Context-free language?
(A) $\{a^nb^nc^n/n \geq 1\}$ (B) $\{ww^R/w \in (0 + 1)^*\}$
(C) $\{wcw^R/w \in (0 + 1)^*\}$ (D) $\{a^nb^n/n \geq 1\}$

20. Which of the following are Deterministic context free language(s)?
(i) $\{0^n1^{m+n}\ 1^m/m, n \geq 0\}$
(ii) $\{0^n1^m0^n/n$ and m are arbitrary$\}$
(A) (i) only (B) (ii) only
(C) Both (i) and (ii) (D) Neither (i) nor (ii)

21. Let L and M be two context free languages then which of the following is not context free?
(A) $L \cup M$ (B) $L\,M$
(C) L^* (D) $L \cap M$

22. Which of the following are undecidable?
(A) Is a given CFG, G ambiguous?
(B) Is the intersection of two CFL's empty?
(C) Are two CFL's the same.
(D) All the above

23. Which languages are accepted by Turing machines only?
(A) Regular languages
(B) Context free languages
(C) Recursively enumerable languages
(D) All the above

24. Which of the following languages are accepted by Turing machines?
(i) set of all strings of balanced parentheses
(ii) $\{0^n1^m0^n1^m/m, n \geq 1\}$
(iii) $\{ww/w \in \{0, 1\}^*\}$
(A) (i), (ii) (B) (ii), (iii)
(C) (i), (iii) (D) (i), (ii), (iii)

25. Which of the following is FALSE?
(A) A problem L is decidable if it is a recursive language.
(B) A problem L is undecidable if it is not a recursive language.
(C) If L is a recursive language then $\overline{L}$ is also recursive.
(D) If L is recursively enumerable language then it is also recursive language.

26. Consider the following grammar:
$S \to Sd/aA/aB$
$A \to ab/d$
$B \to acd/dde$
Parse a string $w = adde$ using Brute force technique, How many back tracks are required?
(A) 6 (B) 4
(C) 0 (D) None of the above

27. Consider the following Grammar:
$S \to Aa/bAc/Bc/bBa$
$A \to d/a/aB$
$B \to d/e$
Parse a string w = "bea" using Brute Force Technique, What is the maximum height of parse tree and how many back tracks are required?
(A) 2, 13 (B) 3, 16
(C) 3, 4 (D) 2, 4

28. In LL(1) parsing, while parsing a string 'w', the Top of the stack contains non terminal 'X' and input string look ahead symbol 'a' and LL(1) parsing Table contains $M[X, a]X \to aBc$

After performing appropriate action, how many symbols are there in stack and what is the Top of the stack?

(A) 4, a (B) 4, c
(C) 3, a (D) 3, c

29. Consider the following grammar:
$A \to X_1|X_2|\varepsilon$
here X_1 and X_2 are the productions of 'A'.
The grammar should be LL(1) grammar if and only if
(A) first(X_1) $\cap$ first (x_2) = ϕ
(B) first(X_1) = first(x_2)
(C) follow(A) $\cap$ first(x_1) $\neq \phi$
(D) first(X_1) $\cap$ first (x_2) $\neq \phi$

30. A non-terminal 'A' is deriving one production
$$A \to X_1\, X_2\, X_3,$$
here X_1, X_2, X_3 are non terminals, which have some productions. Which of the following statement always holds to find first(A)?
(A) first(A) = first(X_1) if ($X_1 \overset{*}{\Rightarrow} \in$)
(B) first(A) = first(X_1)$\cup$ first(X_2) $\cup$ first(X_3)
(C) first(A) = first(X_1)$\cup$ first(X_2) $\cup$ first(X_3) – {$\in$} if ($X_1 \overset{*}{\Rightarrow} \in$)
(D) first(A) = first(X_1) – {$\in$} $\cup$ first($X_2\, X_3$) if ($X_1 \overset{*}{\Rightarrow} \in$)

31. Consider the following Grammar:
S $\to$ AB/aAbAd
B $\to$ a/b/c/$\in$, find follow of the Non-terminal A?
(A) follow(A) = first(B) – {$\in$}
(B) follow(A) = first(B) $\cup$ {d}
(C) follow(A) = first(B) $\cup$ {\$} – {$\in$}
(D) follow(A) = first(B) $\cup$ {d, \$} – {$\in$}

32. While constructing LL(1) parsing Table, place production '$A \to \alpha$' in the following cells of M[X, a], where 'a' is [first (α) contains '$\in$' and terminals]:
(A) only first (α) – {$\in$}
(B) first (α) $\cup$ follow(A)
(C) only in follow(A) – {$\in$}
(D) first (α) $\cup$ follow(A) – {$\in$}

33. In LL(1) parsing Table, M[X, \$] contains production if and only if [here $X \to ABC$]
(A) first (X) contains {$\in$}
(B) first (A) contains {$\in$}
(C) first (AB) contains {$\in$}
(D) data is insufficient

34. Consider the following operator precedence Relational Table. For the string $W = id + id, \times id$, how many handles are possible to accept?

	id	+	*	$
id		•>	•>	•>
+	<•	•>	<•	•>
*	<•	•>	•>	•>
$	<•	<•	<•	

(A) 4 (B) 5
(C) 6 (D) Data insufficient

35. In the above precedence table, what is the associativity of '+' and '*'?
(A) + is right associative and * is left associative
(B) + and * Left associative
(C) + and * Right associative
(D) Data insufficient

Answer Keys

1. D	**2.** D	**3.** C	**4.** D	**5.** D	**6.** C	**7.** C	**8.** A	**9.** B	**10.** B

Hints and Explanations

1. Commutative law for union, associative law for union and concatenation holds for regular expression. But commutative law for concatenation doesn't hold. Choice (D)

2. Choice (D)

3. Regular languages are accepted by FA. It has only limited storage, so it can't compare the front of a string with its back. Similarly it can't check the equality of 0's. Choice (C)

4. No language is regular (Not recognized by FA). Choice (D)

5. Choice (D)

6. PDA is an $\in$-NFA with the addition of a stack. Choice (C)

7. Choice (C)

8. Error detection in Top down parser is difficult compared to Bottom up parser. Choice (A)

9. S-Attribute grammar uses synthesized attributes. L-Attributed grammar uses both synthesized and inherited attributes. As it scans Left to right inherited attribute, it must inherit from parent or left hand side siblings. Choice (B)

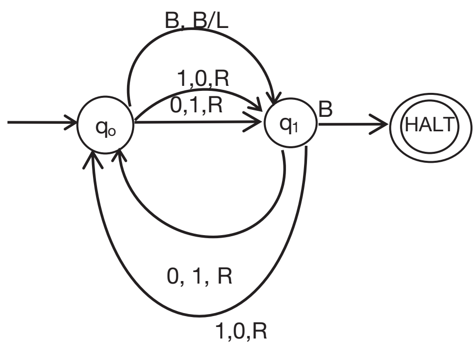
10. L-attributed grammar uses both synthesized and inherited attributes, it scans from Root node to leaf nodes in Depth first search, left to right manner. Choice (B)

11. A grammar is said to be attribute grammar if and only if it does not contain side effects like any action rule print something. Choice (C)

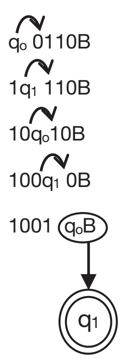
12. L-Attributed grammar Traverses parse tree in Depth first search manner, left to right. Choice (A)

13. Reverse polish notation, Abstract syntax tree, Direct acyclic graph are high level intermediate code forms, three address code is low level intermediate code form. Choice (D)

14.



For example, take string 0110 and check whether it is accepted
by TM or not



Final accepting state

$\therefore$ Any string of length 1 or more of $\{0, 1\}$ is accepted by given TM. Choice (C)

15. In early age of compilers, developers focused on syntax analysis and recently, on optimization, focused mainly on code optimization and risc. Choice (D)

16. Choice (C)

17. Given DFA accepts any number of 1's and (01'*s*) repeatedly. The regular expression is $(1 + 01)^*$ $= [1^* (01)^*]^*$. Choice (D)

18. $S \to AS/\in$

$A \to aa/ab/ba/bb$

It generates $\{a^n\ b^n\}$ but it generates $\{aa, aaaa, \ldots\}$ also. It also won't generate equal number of a's and b's. It won't generate single 'a'. It generates even length strings. Choice (B)

19. The CFL's are accepted by PDA's. The PDA has a stack storage it moves only towards right side of string. It can't check equality of a's b's and c's. But it can check $\{ww^R\}$, $\{wcw^R\}$, $\{a^n\ b^n\}$ patterns. Choice (C)

20. $\{0^n\ 1^{m+n}\ 0^m / m, n \in 0\}$

Push 0's whenever 1's are in input, pop 0's i.e., matching between 0's and 1's. After that push remaining 1's and pop them whenever 0's occur.

There is no non determinism. So it is DCFL.

Similarly we can check the equality of 0's in (ii) by pushing first set of 0's & pop them with last set of 0's. Choice (C)

21. CFL's are not closed under intersection. Choice (D)

22. Choice (D)

23. Recursively enumerable languages are only accepted by TM. Regular, CFL's are accepted by TM but they are also accepted by FA, PDA respectively. Choice (C)

24. A TM has infinite storage buffer, which can move in two directions (forward, backward) and also it has both read and write capabilities.

All the given three languages are accepted by TM's. Choice (D)

25. A language L is recursive if both L and $\overline{L}$ are recursively enumerable. Choice (D)

26. Fall into infinite Loop in Brute Force Technique, Blindly substitute the first productions.

$S \Rightarrow Sd$

$\Rightarrow\ Sdd$

$\Rightarrow\ Sddd$

$\Rightarrow\ Sdddd$

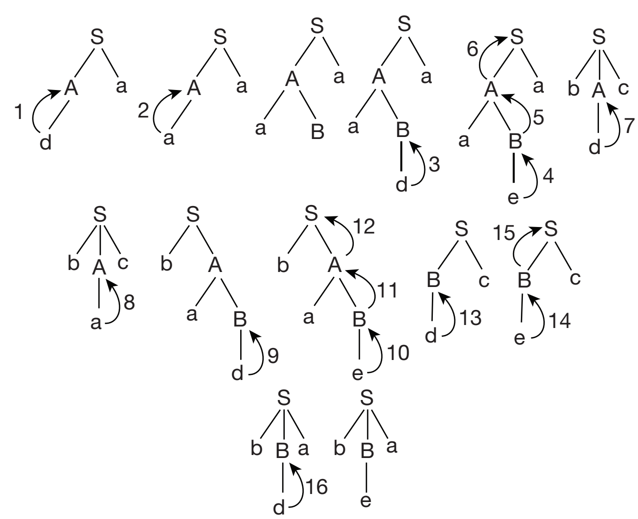
:

:

Infinite Loop

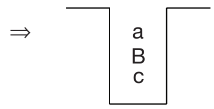
Choice (D)

27.



Choice (B)

28.



$M[X, a]$: $X \to aBc$

Replace X by aBc such that a is Top of the stack.

Choice (C)

29. In LL(1) parsing table construction, for a production '$A \to \alpha$'

Place the production in first (α) column and in 'A' row. $A \to X_1|X_{21}\ A \to X_1$, in first ($x_1$), and $A \to x_2$ in first (x_2). So if we have common symbol then it is a conflict in LL(1) parser. Choice (A)

30. first(A) = first ($X_1\ X_2\ X_3$) = first(X_1), if first (X_1) contains '$\in$' then we have to take first (X_2). If first (x_2) also contains '$\in$' then go for first (x_3) also. If first (x_3) contains '$\in$' then it will be added to 'A's first.

Choice (D)

31. follow(A) = $\{a, b, c, d, \$\}$

follow(A) = first (B) $\cup$ first(b) $\cup$ first (d)

first(B) contains '$\in$' then 'A' is followed by '$\in$'. If a non terminal followed by '$\in$' then take follow of Left hand side non terminal i.e., follow(A) = follow(S)

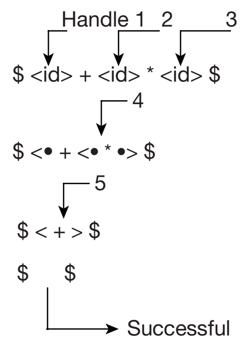
Choice (D)

32. In LL(1) parsing, place '$A \to \alpha$' in first (α) columns. If first (α) contains '$\in$' also place '$A \to \alpha$' in follow (A).

Choice (D)

33. \$ is in follow set only. A production '$A \to \alpha$' placed in every symbol follow set if and only if first(α) contains '$\in$'. So '$X \to ABC$' placed in '\$' column if and only if first (ABC) contains '$\in$'. Choice (A)

34.



Choice (B)

35. In operator precedence parsing table θ_1 and θ_2 are two Operators and have equal precedence then

$\theta_1 < \theta_2$ if Right associative

$\theta_1 > \theta_2$ if Left associative

So

$+ > +$, $* > *$

Left associativity

Choice (B)

Computer Network

Computer network is the collection of two or more computers that are interconnected with each other to perform data communication using the data communication protocol through communications media (wired or wireless) .So these computers can share information, data, programs, and use of hardware together. Data communications that can be done include text data, images, video and sound.

Or

A computer network, often simply referred, as a network is a collection of computers and devices interconnected by communication channels that facilitate communication and allow sharing of resources and information among interconnected devices. There are different networks:

1. LAN
2. MAN
3. WAN

LAN

A Local Area Network (LAN) is a network that is confined to a relatively small area. It is generally limited to a geographic area such as a lab, school, or building. LAN Computers rarely spans more than a mile apart.

In a typical LAN configuration, one computer is designated as the file server. It stores all the software that controls the network, as well as the software that can be shared by the computers attached to the network. Computers connected to the file server are called workstations. The workstations can be less powerful than the file server, and they may have additional software on their hard drives. On many LANs, cables are used to connect the network interface cards in each computer. However, one LAN can be connected to other LANs over any distance via telephone lines and radio waves.

Most LANs connect workstations and personal computers. Each node (individual computer) in a LAN has its own CPU which executes programs and it is also able to access data and devices anywhere on the LAN. This means that many users can share expensive devices, such as laser printers, as well as data. Users can also use LAN to communicate with each other, by sending e-mail or engaging in chat sessions.

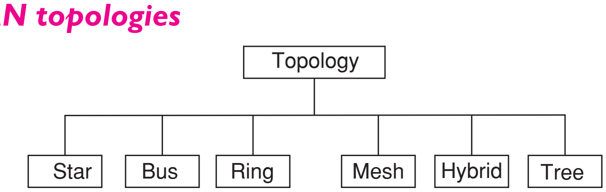
Three characteristic features of LAN

1. The size of a LAN network.
2. The topology of the local area network.
3. The technology used for transmission.

In simple LAN configuration, a single cable runs through the entire set up and the peripherals and computers are attached to the cable. Traditional LAN speeds are 10 Mbps to 100 Mbps. Modern LAN cables are capable of much higher data transfer per second.

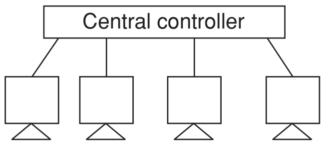
In case two or more systems need to use the LAN at the same time, then an arbitration mechanism is deployed to resolve the conflict. A first come first serve policy or a prioritized approach may be chosen.

LAN topologies



Star Topology Each device has a dedicated point-to-point link to a central controller called a hub. Most used LAN topology.

If one device wants to send data to another, it sends the data to the controller, which then relays the data to the other connected device as shown in the figure.



Each device needs only one link and one I/O port to connect it to any number of others.

Advantages

1. Robust, if one link fails, only that link is affected. All other links remain active.
2. As long as hub is working, it can monitor link problems and by pass defective links.

Disadvantages

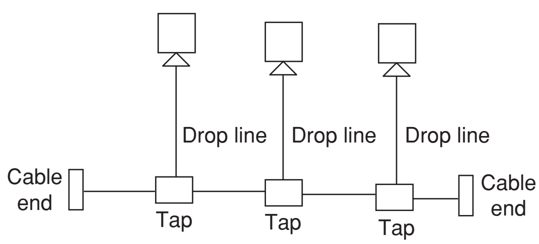
1. If hub goes down, the whole system dead.
2. More cabling is required in a star than ring or bus.

Bus Topology A bus topology is multipoint. One long cable acts as a backbone to link all the devices in a network.

Carrier Sense Multiple Access/Collision Detection (CSMA/CD) is the accessing technique used.

The traffic can go in either direction, i.e., it is bidirectional.

Nodes are connected to the bus cable by drop lines and taps as shown in the figure.



Advantages

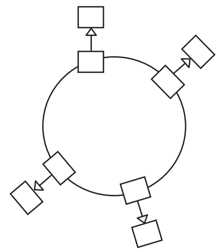
1. Ease of installation.
2. Require less cabling than mesh or star topologies.

Disadvantages

1. Difficult to add new devices.
2. A fault in the bus cable stops all transmission. The damaged area reflects signals back in the direction of origin, creating noise in both directions.

Ring Topology Each device has a dedicated point-to-point connection with only the two devices on either side of it.

Each device in the ring incorporates a repeater; when a device receives a signal intended for another device, its repeater regenerates the bits and passes them along.



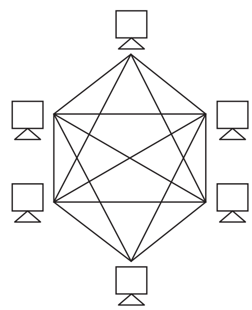
Advantages

1. Easy to install and reconfigure.
2. Fault isolation is simplified as it issues alarm which alerts the network operator to the problem and its location.

Disadvantages

1. A break in the ring can disable the entire network.
2. It is not relevant for higher-speed LANs.

Mesh topology Every station is interconnected to every other station as shown in the figure.



$n(n-1)/2$ (duplex mode) links are required for communication in both directions. Each device on the network must have $(n-1)$ I/O ports to be connected to the other $(n-1)$ stations.

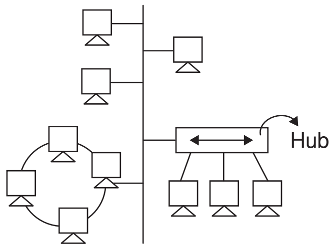
Advantages

1. The use of dedicated links guarantees that each connection can carry its own data load, thus eliminating traffic problems.
2. This topology is robust. If one link becomes unusable, it does not incapacitate the entire system.
3. There is advantage of security, only the intended recipient sees the message on the dedicated line.
4. Fault identification and fault isolation is easy because of point-to-point links.

Disadvantages

1. As the hardware(cables) required for connection is more, it is expensive.
2. Installation and reconnection are difficult.
3. The sheer bulk of the wiring can be greater than the available space.

Hybrid Topology More than one topology in a network.



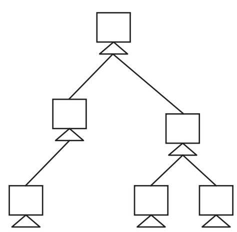
Advantages

1. Fault detection is easier.
2. We can add new stations without affecting the original architecture.

Disadvantages

1. As different topologies are combined so complexity of design increases. Very less practical implementation.
2. The hub which is used to connect different topologies is very costly. Moreover the cost of whole infrastructure is very high.

Tree Topology This topology uses the combination of star and bus topology.



Advantages

1. Expansion is easier; one can add new stations easily.
2. Errors can be easily detected.
3. Robust, if one link fails the remaining system is in communication.

Disadvantages

1. With the increase in the number of nodes, complexity and maintenance become difficult.

Examples: The most common type of local area network is an Ethernet LAN. The smallest home LAN can have exactly two computers; a large LAN can accommodate thousands of computers. Many LANs are divided into logical groups called subnets. An Internet Protocol (IP) 'Class A' LAN can in theory accommodate more than 16 million devices organized into subnets.

MAN

A metropolitan area network is a computer network that usually spans a city or a large campus. A MAN usually interconnects a number of local area networks (LANs) using a high-capacity backbone technology, such as fiber-optical links, and provides up-link services to wide area networks (or WAN) and the Internet.

WAN

Wide Area Networks (WANs) connect larger geographic areas, such as Florida, the United States, or the world. Dedicated transoceanic cabling or satellite uplinks may be used to connect this type of network.

A WAN is complicated; it uses multiplexers to connect local and metropolitan networks to global communications networks like the Internet. To users, however, a WAN will not appear to be much different than a LAN. As the term implies, a WAN spans a large physical distance. The Internet is the largest WAN, spanning the Earth.

A WAN is a geographically-dispersed collection of LANs. A network device called a router connects LAN to a WAN. In IP networking, the router maintains both a LAN address and a WAN address.

A WAN differs from a LAN in several important ways. Most WANs (like the Internet) are not owned by any one organization but rather exist under collective or distributed ownership and management. WANs tend to use technology like ATM, Frame Relay and X.25 for connectivity over the longer distances.

Residences typically employ one LAN and connect to the Internet WAN via an Internet Service Provider (ISP) using a broadband modem. The ISP provides a WAN IP address to the modem, and all of the computers on the home network use LAN (so-called private) IP addresses. All computers on the home LAN can communicate directly with each other but must go through a central gateway, typically a broadband router, to reach the ISP.

The OSI Reference Model

The concept of how a modern day network operates can be understood by dissecting it into seven layers. This seven layer model is known as the OSI Reference Model and defines how the vast majority of the digital networks on earth function. OSI is the acronym for Open Systems Interconnection. The important concept to realize about the OSI Reference Model is that it does not define a network standard, but rather provides guidelines for the creation of network standards.

Physical Layer

The first layer of a network is the Physical Layer. The Physical Layer is literally what its name implies: the physical infrastructure of a network.

This includes the cabling or other transmission medium and the network interface hardware placed inside computers

and other devices which enable them to connect to the transmission medium.

The purpose of the Physical Layer is to take binary information from higher layers, translate it into a transmission signal or frequency, transmit the information across the transmission medium, receive this information at the destination and finally translate it back into binary before passing it up to the higher layers.

Transmission signals or frequencies vary between network standards and can be as simple as pulses of electricity over copper wiring or as complex as flickers of light on optical lines or amplified radio frequency transmissions.

The information that enters and exits the Physical Layer must be bits; either 0s or 1s in binary. The higher layers are responsible for providing the Physical Layer with binary information. Since almost all information inside a computer is already digital, this is not difficult to achieve.

The Physical Layer does not examine the binary information nor does it validate it or make changes to it. The Physical Layer is simply intended to transport the binary information between higher layers located at points A and B.

Data Link Layer

The second layer in the OSI Model is the Data Link Layer, the only layer in the OSI model that specifically addresses both hardware and software.

The Data Link Layer receives information on its software side from higher layers, places this information inside ‘frames’, and finally gives this frame to the Physical Layer, Layer 1, for transmission as pure binary.

A frame essentially takes the information passed down from a higher layer and surrounds it with Physical Address information. This information is important for the Data Link Layer on the receiving end of the transmission.

When the frame, in binary form, arrives at the destination node, it is passed from the transmission medium to the Data Link Layer (Layer 2) by the Physical Layer (Layer 1).

The Data Link Layer on the receiving node checks the frame surrounding the information received to see if it’s Physical Address matches that of its own. If the Physical Address does not match, the frame and its encapsulated data is discarded. If the Physical Address is a match, then the information is removed from the frame and passed up to the next highest layer in the OSI Model.

The Physical Addressing system allows multiple nodes to be on the same network medium, but retain the ability to address only a specific node with a transmission.

The Physical Address used in the Data Link Layer’s Physical Addressing system is known as a MAC address and is embedded physically into the node’s Network Interface Card during manufacturing.

Every NIC’s MAC address is unique in order to prevent addressing conflicts. It is this relationship that causes the Data Link Layer to be known as the only layer that addresses both hardware and software.

In this layer the information on the network makes the move from the physical infrastructure of the network into the software realm. The remainders of the OSI reference model’s layers are entirely software.

Network Layer

OSI Layer 3 is known as the Network Layer. The purpose of the Network Layer is to direct network traffic to a destination node who’s Physical Address is not known. This is achieved through a system known as Logical Addressing.

Logical Addresses are software addresses assigned to a node at Layer 3 of the OSI Model. Since these addresses are able to be defined by software rather than being random and permanent like Physical Addresses, Logical Addresses are able to be hierarchical. This allows extremely large networks to be possible.

A smart device working at Layer 3 that handles network signals from each node directly rather than nodes just blindly repeating packets at Layer 1 until they happen to reach their destination. Such a device is known as a network router.

A network router sits in the center of a network with all nodes having a direct link to it rather than being linked to each other. This strategic position allows the router to intercept and direct all traffic on the network.

A routed network can be illustrated by a star formation, as shown in Diagram 1. On a routed network, Layer 3 packets are no longer broadcasted to all nodes, but rather received by the router and passed on only to the appropriate node. This is a valuable concept because it allows for the collision free-transport of packets across a network.

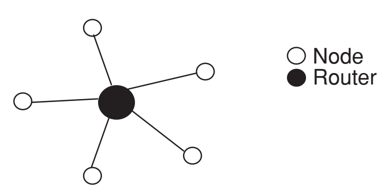


Figure 1

As being linked directly to all nodes in a local network, a router can be linked directly to other routers. This allows groups of nodes separated by distance to communicate with each other in a practical way.

It would not be practical to have nodes separated by a great distance all connected to a single router. The amount of cabling required would be immense and depending on the number of nodes involved, the router may not posses the required number of physical connections.

Routers can be chained in a line, or as shown in Diagram 2, can be connected by a central router. This concept is virtually infinitely scalable and is very efficient.

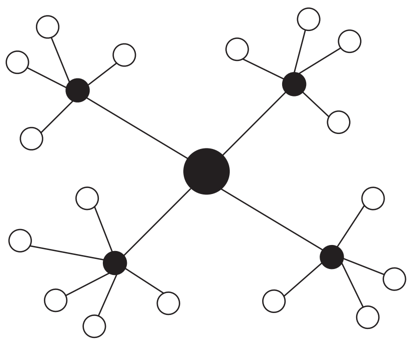

Figure 2

When a node starts a transmission, the OSI Layer 3 protocol takes the information passed down from higher layers and encapsulates it with the logical address of the destination node in a unit called a packet.

This packet, then passes through the remaining lower layer protocols, is transmitted over the network medium from the node to the router. This router reads the logical address that the packet contains and compares it to a list of physical addresses of nodes that are directly connected to it.

If the packet's destination address matches an entry in this list, the packet is transmitted directly on the line that leads straight to the destination node.

If the router does not know of a direct connection to the destination node, the packet is transmitted on a line leading directly to another router. This router then treats the packet much like the first router did upon receipt.

The packet's logical address is checked for matches against the list of logical addresses belonging to nodes directly connected to the router.

If the packet reaches a router with connections only to other routers, as shown in Diagram 2, the router uses the logical address's orderly numbering scheme to try and determine the closest router to the destination node and then transmits the packet to that router.

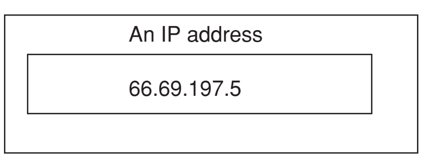

Figure 3

In IP, logical addresses look like four sets. Diagram 3 shows an example of an IP address. IP addresses are orderly on four levels, from left to right. The first section of the IP address refers to a top level router, or a router that is at the highest level of this particular branch of the network. In Diagram 3, the first number is 66. Therefore all IP addresses between 66.0.0.1 and 66.255.255.255 are managed by this router. Only one router is required in a routed network, but more may exist. A router may have a maximum of 255 nodes, which may be either ordinary nodes or other routers. This effectively means that each branch of a network, a group of nodes that have the first set of numbers in their IP address in common, could theoretically have over sixteen million end nodes.

Transport Layer

OSI Layer 4 is known as the Transport Layer, all information transferred is assumed to be at the correct destination node and is being passed up to Layer 4.

The Transport Layer is responsible for the reliability of the link between two end users and for dividing the data that is being transmitted by assigning port numbers to its Layer 4 packages, known as segments.

Ports can be thought of as virtual destination mailboxes or outlets. When information reaches a Layer 4 protocol, the segment is examined to determine the destination port of the data it contains. Once the port is determined, just as all of the past layers have done, the wrapper is discarded and the payload data passed up to the next layer's protocol.

Higher layer protocols that provide services such as email, web browsing, text chat, file transfer and more, each operate on their own unique Layer 4 port, allowing all of these protocols to be operated at once without interference.

On the reliability front, Transport Layer protocols are be capable of running a checksum on the payload data, which they carry. This allows the protocol to determine the integrity of incoming payload data. If this data has been corrupted, the Layer 4 protocol will request the segment to be retransmitted.

Session Layer

OSI Layer 5, known as the Session Layer, still serves a purpose in the OSI Reference Model. The Session Layer draws the outline for protocols that manage the combination and synchronization of data from two separate higher layers.

Layer 5 protocols are responsible for ensuring that the data is Synchronized and consistent before transmitted. A good example is the streaming of live multimedia audio and video, where perfect synchronization between video and audio is desired.

Presentation and Application Layers

The sixth and seventh layers in the OSI Reference Model are the Presentation Layer and the Application Layer. The primary purpose of these layers is to facilitate the movement of formatted information between applications interacting with end users on nodes.

Commonly used top layer protocols are HTTP (for the secure transfer of web page related files), File Transfer Protocol (FTP), Simple Mail Transfer Protocol (SMTP, used for sending email messages), and SSH (Secure Shell), used to secure remote shell access for a computer operating system.

OSI reference model concept

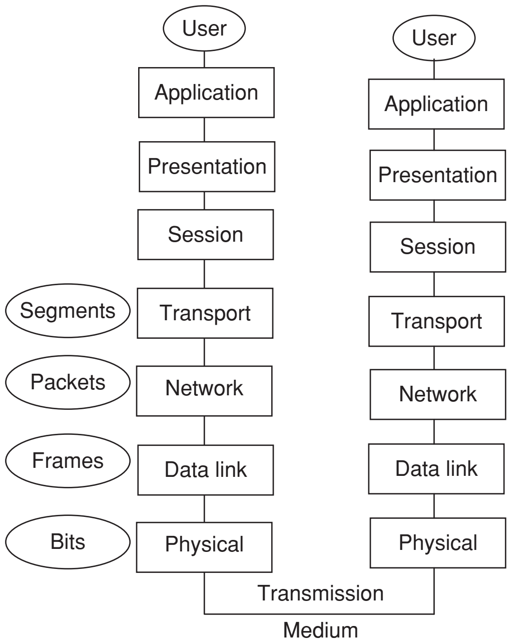

Figure 4

The OSI Reference Model exists not to make hard rules or to shape the industry, but to provide a logical, well-researched, and tested model after which the world's best communication protocol stacks are modeled. The TCP/IP stack is very well-known for being the driving force behind most of the internet, and represents the third (IP) and fourth (TCP) layers of the OSI Model. Every layer in the OSI Model is a reference for a protocol which must facilitate communication between both higher and lower layers. The 'U-shaped' example shown in Diagram 4 provides a visual concept of how two users may be linked on a given network in reference to the OSI Model. Data starts and ends with the user. From the Application Layer of the first user, it must travel down through layers 7 to 1, across the transmission medium, then back up to layers 1 to 7 to be presented at the Application Layer to the user on the end of the transmission. Diagram 4, shows an example of a path between two nodes. Protocols defined by this reference are dependent on the next lowest layer protocol. So, for example, one could not run an Application Layer protocol on a node without the presence of Layer 1 through 6, protocols also being utilized on the node.

LAN TECHNOLOGIES

IEEE standard for networking

IEEE standard project 802 is designed for the enter – connectivity between LAN's

IEEE 802 maps to physical and data link layer

Example: Ethernet, Token ring etc, the IEEE standards for the different groups are

802.1	–	Higher layer LAN Protocol	Active working grourp
802.3	–	Ethernet	
802.11	–	Wireless LAN	
802.15	–	WPAN	
802.16	–	Broad band wireless Access	
802.17	–	Resilient packet Ring	
802.18	–	Radio Regulatory TAG	
802.19	–	Co existence TAG	
802.20	–	Mobile Broad band wireless access	
802.21	–	Media independent Hand off	
802.2	–	Logical link control working group	In active or dis-banded working groups
802.4	–	Token Bus	
802.5	–	Token Ring	
802.7	–	Broad band area Network	
802.8	–	Fiber optic TAG	
802.9	–	Integrated service LAN	
802.10	–	Security working group	
802.12	–	Demand priority working group	
802.14	–	Cable modern working group	

Ethernet

We have

10 Mbps – Ethernet
100 Mbps – Fast ethernet
1 Gbps – Gigabit Ethernet
10 GE – 10 Gigabit Ethernet

Best suited for LAN because it is capable of handling high speed bandwidth.

- Ethernet medium:
  Thick wire – 10B5
  Thin wire – 10B2
  Twisted pair – 10BT, 100BT, 1000BT
  Fibre – 10BF, 100BF, 1000BF
  CAT 4 – 10 Mbps
  CAT 5 – 10/100 Mbps
  CAT 6 – 10/100/1000 Mbps
- Fundamental is CSMA/CD, Standard is 802.3.
- It defines two categories:
  1. Base band. 2. Broad band
- Baseband uses digital manchester encoding techniques.
- IP communication in ethernet is of 3 types:
  (i) Unicast
  (ii) multi cast
  (iii) broadcast
- When user sends data he puts destination and source address.
  (i) In unicast, only intended users responds, however all can get the signal (individual MAC).
  (ii) In multicast, group of users will get the data (group MAC).
  (iii) In broadcast, all users on Ethernet can see the data (all MAC).
- Every computer accepts 3 types of packets, to his own, to the group it belongs, to all.

CSMA/CD

CSMA (Carrier Sense Multiple Access)

CSMA protocols performance is better than ALOHA—Monitor the channel before and/or during data transmission.

1-Persistent Check whether the channel is free before transmitting the data. If busy, wait until it becomes free and then immediately start Re-transmitting.

Non-Persistent When the channel is busy, wait for a random period of time before trying again

If the waiting time is too long, the channel utilization decreases.

P-Persistent Used in slotted systems, If the channel is idle during the current slot, transmit with probability P, and defer until next slot with probability $(1 - P)$

Two or more computers can get connected on same physical medium. All computers can communicate whenever they feel like. Any computer want to communicate, it senses the medium, if medium is free and not used by anyone it captures the medium and puts its data on to the channel.

All computers listens to the sent data but only intended computer/system will respond. At this instance, sending computer is owner of the medium; no other system can be owner or can send the data. When two or more computers try to send data at same time by sensing the medium, collision occurs, which will be sensed by all the computers, then they keep integral wait unit of time for next transmission of data. Once the sending machine gets the corrupted collision message it retransmits using integral time.

MAC sublayer

The medium Access control (MAC) sub layer is the bottom half of the Data link layer. The upper half is commonly called logical link control (LLC) sublayer.

Frame format

Preamble	SFD	Destination address	Source address	Length or type	Data and padding	CRC
7 bytes	1 byte	6 bytes	6 bytes	2 bytes	46 to 1500 bytes	4 bytes

Preamble The first field of the 802.3 frame contains 7 bytes (56 bits) of alternating 0's and 1's that alerts the receiving system to the coming frame and enables it to synchronize its input timing.

Start frame delimiter (SFD) The second field (1 byte: 10101011) signals the beginning of the frame. The SFD warns the station or stations that, this is the last chance for synchronization. The last 2-bits is 11 and alerts the receiver that the next field is the destination address.

Destination address (DA) The DA field is 6 bytes and contains the physical address of the destination station to receive the packet.

Source address (SA) The SA field is also 6 bytes and contains the physical address of the sender of the packet.

Length field The original ethernet used this field as the type field to define the upper-layer protocol using the MAC frame. The IEEE standard uses it as the length field to define the number of bytes in the data field.

Data This field contains data encapsulated from the upper layer protocols. It is of minimum 46 bytes and a maximum of 1500 bytes.

Ethernet follows **binary exponential back off** algorithm to give waiting time for stations, which are involved in collisions. After collisions, waiting time for the stations will be K * 51.2 µ sec, where K is randomly picked up from 0 to $2^n - 1$, 'n' is the collision number. But after 10 collisions, the randomization internal is frozen at a maximum of 1023 slots.

If each station transmits during a contention slot with probability p, the probability A that some station acquires the channel in that slot is

$A = Kp\,(1 - p)^{k-1}$

A is maximized when $p = 1/k$, with $A \to 1/e$ as $K \to \infty$

The probability that the contention internal has exactly j slots in it is $A(1 - A)^{j-1}$, hence mean number of slots per contention is given by

$$\sum_{j=0}^{\infty} jA(1-A)^{j-1} = \frac{1}{A}$$

CRC The last field contains error detection information.

Frame length

Ethernet has imposed restrictions on both the minimum and maximum lengths of a frame, as shown in figure below:.

Minimum payload length: 46 bytes

Maximum payload length: 1500 bytes

Destination address	Source address	Length PDU	Data and padding	CRC
6 bytes	6 bytes	2 bytes		4 bytes

Minimum frame length: 512 bits or 64 bytes

Maximum frame length: 12,144 bits or 1518 bytes

Minimum length of frame is 512 bytes or 64 bytes. If we count 18 bytes of header and trailer, then minimum length of data from the upper layer is 64 – 18 = 46 bytes.

If the upper layer packet is less than 46, padding is added to make up the difference and used to find out collision. Maximum length of the frame is 1518 bytes. If we substract 18 bytes of header and trailer, the maximum length of the payload is 1500 bytes.

- The maximum length restriction has two reasons.
- First, memory was very expensive when ethernet was designed, a maximum length restriction helped to reduce the size of the buffer.
- Second, the maximum length restriction prevents one station from monopolizing the shared medium, blocking other stations that have data to send.

Since each slot has a duration $2T$, the mean contention internal, w, is $2T/A$. Assuming optional p, the mean number of contention slots is never more than e, so w is atmost $2Te$ = 5.4 T.

$$\text{Channel efficiency } = \frac{p}{p+2T/A}$$

$$= \frac{1}{1+2B\dfrac{Le}{cF}}$$

Where F = Frame length
B = Network bandwidth
L = Cable length
C = Speed of signal propagation
E = Contention slots per frame

802.5 TOKEN Ring

Here ring topology is used and devices are physically arranged to form a ring. A token is passed among stations. If a station wants to send data, it must wait and capture the token. Only the token holders are permitted to transmit frame. Token ring allows each station to send one frame per turn.

Frame formats

SD	AC	FC	Destination address	Source address	Data	CRC	ED	FS
1 byte	1 byte	1 byte	2-6 bytes	2-6 bytes	Up to 4500 bytes	4 bytes	1 byte	1 byte

SD	AC	ED

Token frame

SD	ED

Abort frame

802.5 Token ring uses differential Manchester digital signal encoding. It supports data rates upto 16 mbps. Tokens ring protocol specifies three types of frames: Data, token, and abort.

The token and abort frames are both truncated data frames.

Data frame

Start delimiter (SD) It is one byte long and is used to alert the receiving station for the arrival of a frame as well as to synchronize it's timing.

Access control (AC) It is one byte long and includes subfields. It has the format PPPTMRRR. First 3-bits are priority field. T denotes whether this is a data frame, token or an abort frame. Token bit is followed by monitor bit. The last 3 bits are the reservation field that can be set by stations wishing to resume access to ring.

Frame control This field is one byte long and contains two fields. The first is a one bit field used to indicate the type of information (whether it is a control information or data). The second uses the remaining seven bits of the byte and contains information used by the token ring logic.

Destination address (DA) The six byte DA field contains the physical address of the frame's next destination.

Source address (SA) The six byte SA field contains the physical address of the sending station.

Data contains LLC data unit Data contains 0 or more bytes, maximum size of the data depends upon taken holding time.

CRC The CRC field is 4 byte long and contains a CRC – 32 bit error detection sequence.

End delimiter (ED) ED is a second flag field of one byte and indicates the end of the sender's data and control information.

Frame status It is one byte long

A/C			A/C		

A: Addressed recognized bit
C: Copies bit

It can be set by the receiver to indicate that the frame has been read/copied etc.

When a frame arrives at the station with the destination address, the station turns A bits to 1. If station copies the frame to the station it also turns on the C bit. A station might fail to copy a frame due to lack of frame buffer or other reason.

When the sending station receives the frame, it examines the A and C bits.

Three combinations are possible:

1. $A = 0$, $C = 0$: destination not ready /present.
2. $A = 1$, $C = 0$: destination present byte frame not accepted.
3. $A = 1$, $C = 1$: destination present and frame copied.

Token frame

It includes only 3 fields: SD, AC and ED

1. The SD indicates, the frame is coming
2. The AC indicates that the frame is a token and includes priority and reservation fields. $T = 0$ for token in AC.
3. The ED indicates the end of the frame.

Abort frame

An abort frame contains no information at all just starting and ending delimiters. It can be generated by the sender to stop its own transmission. Each station has a priority code, as a frame passes by, a station waiting to transmit may reserve the next open token by entering its priority code in the Access control field (AC) of the token or data frame. A station with a higher priority may remove a lower priority reservation and replace it with its own. Among stations of equal priority, the process is first come, first served. Through this mechanism, the station holding the reservation gets the opportunity to transmit as soon as the token is free, whether or not it comes next physically on the ring.

Monitor station Several problems may appear to disrupt the operation of a token ring network. If the token is destroyed by noise there will be no token on the ring and no station can send data. To solve such a problem, one station on the ring is designated as a monitor. The monitor sets a time, each time the token passes. If the token does not appear in the allotted period of time, it is assumed to be lost and the monitor generates a new token and introduces it to the ring. The monitor detects the orphan frames, by setting the monitor bit in the access control byte.

As the frame passes, the monitor checks the status field. If the monitor bit is set, something is wrong since the frame has passed the monitor twice, so monitor discards it. The monitor then destroys the frame and puts a token on the ring. If monitor fails, the protocol ensures that another station is quickly selected as monitor. Every station has the capability of becoming the monitor. While the monitor is functioning properly, it alone is responsible for seeing that the ring operates correctly.

When station notices that either of its neighbors appears to be dead it transmits BEACON frame giving the address of the dead station.

Physical Layer

Physical layer is concerned with transmitting raw bits over a communication channel. The design issues have to do with making sure that when one side sends a 1-bit, it is received by the other side as 1-bit and not as 0 bit. In physical layer we deal with the communication medium used for transmission.

Types of Medium

Medium can be classified into two categories:

1. Guided Media: Guided media means that signals are guided by the presence of physical media i.e., signals are under control and remains in the physical wire. For example, copper wire.
2. Unguided Media: Unguided media means that there is no physical path for the signal to propagate. Unguided media has essentially electromagnetic waves. There is no control on flow of signal. For example, radio waves.

Transmission Media

In Guided transmission media, generally two kinds of materials are used.

1. Copper
   - Coaxial cable
   - Twisted pair
2. Optical Fiber

Coaxial cable

Coaxial cable consists of an inner conductor and an outer conductor which are separated by an insulator. The inner conductor is usually copper. The outer conductor is covered by a plastic jacket. It is named coaxial because the two conductors are coaxial. Typical diameter of coaxial cable lies between 0.4 inches to 1 inch.

Twisted pair

A twisted pair consists of two insulated copper wires, typically 1mm thick. The wires are twisted together in a helical form, the purpose of twisting is to reduce cross talk interference between several pairs. Twisted pair is much cheaper than coaxial cable but it is susceptible to noise and electromagnetic interference and attenuation is large.

Optical fiber

In optical Fiber light is used to send data. In general terms presence of light is taken as bit-1 and its absence as bit 0. Optical fiber consists of either glass or plastic core which is surrounded by cladding of the same material but of different refractive index. This cladding is surrounded by a plastic jacket which prevents optical fiber from electromagnetic interference and harshly environments. It uses the principle of total internal reflection to transfer data over optical fibers. Optical fiber is much better in bandwidth as compared to copper wire, since there is hardly any attenuation or electromagnetic interference in optical wires. Hence there is

less requirement to improve quality of signal, in long distance transmission. Disadvantage of optical fiber is that end points are fairly expensive.

Communication Links

In a network nodes are connected through links. The communication through links can be classified as

Simplex Communication can take place only in one direction.
Example: TV broadcasting.

Half duplex Communication can take place in one direction at a time. Suppose node A and B are connected then half duplex communication means that at a time data can flow from A to B or from B to A but not simultaneously.
Example: Two persons talking to each other such that when one speaks the other listens and vice versa, walkie-talkies, citizens band radios.

Full duplex Communication can take place simultaneously in both directions.
Example: telephone network.

Links can be further classified as:

Point-to-Point In this communication only two nodes are connected to each other. When a node sends a packet then it can be received only by the node on the other side and none else.

Multi-Point It is a kind of sharing communication in which signal can be received by all nodes. This is also called broadcast.

Digital Data to Digital Signals

A digital signal is sequence of discrete, discontinuous voltage pulses. Each pulse is a signal element. Encoding scheme is an important factor in knowing that how successfully the receiver interprets the incoming signal.

Encoding techniques

Following are several ways to map data bits to signal elements:

Non-return-to-zero (NRZ): NRZ codes share the property that voltage level is constant during a bit interval. High level voltage = bit 1 and low level voltage = bit 0. A problem arises when there is a long sequence of 0's and 1's and the voltage level is maintained at the same value for a long time.

This creates a problem on the receiving end because now, the clock synchronization is lost due to lack of any transitions and hence, it is difficult to determine the exact number of 0's and 1's in this sequence.

The two variations are as follows:

1. *NRZ–Level*: In NRZ–L encoding, the polarity of the signal changes only when the incoming signal changes from a '1' to a '0' or from a '0' to a '1'. NRZ – L method, looks just like the RZ method, except for the first input one data bit. This is because NRZ does not consider the first data bit to be a polarity change, where NRZ–L does.
2. *NRZ–Inverted*: Transition at the beginning of bit interval = bit 1 and no transition at the beginning of bit interval = bit 0 or vice versa. This technique is known as differential encoding.

Digital Data Communication Techniques

For two devices linked by a transmission medium to exchange data, a high degree of co-operation is required. Typically data is transmitted one bit at a time. The timing (rate, duration, spacing) of these bits be same for transmitter and receiver. There are two options for transmission of bits.

Parallel All bits of a byte are transferred simultaneously on separate parallel wires. Synchronization between multiple bits is required which becomes difficult over large distance. Parallel communication gives large bandwidth but expensive, possible only for devices which are close to each other.

Serial Bits transferred serially one after other. Serial communication gives less bandwidth but cheaper, suitable for transmission over long distances.

Manchester encoding

Manchester encoding is used in Ethernet (IEEE 802.3) it is a line code in which bit encoding has at least one transition and consumes the same time.

It ensures frequent line voltage transitions, which are directly proportional to clock rate

It is not dependent on data, so it will not carry any information.

Transmission Techniques

Asynchronous

Small blocks of bits (generally bytes) are sent at a time without any time relation between consecutive bytes. When no transmission occurs a default state is maintained corresponding to bit 1, due to arbitrary delay between consecutive bytes, the time occurrences of the clock pulses at the receiving end need to be synchronized for each byte. This is achieved by providing two extra bits, start and stop.

Start Bit It is prefixed to each byte and equals 0. Thus it ensures a transition from 1 to 0 at onset of transmission of byte. The leading edge of start bit is used as a reference for generating clock pulses at required sampling instants. Thus each onset of a byte results in resynchronization of receiver clock.

Stop Bit To ensure that transition from 1 to 0 is always present at beginning of a byte it is necessary that default state be 1, but there may be two bytes one immediately following the other and if last bit of first byte is 0, transition from 1 to 0 will not occur. Therefore a stop bit is suffixed to each byte equaling 1. It's duration is usually 1, 1.5, 2 bits. Asynchronous transmission is simple and cheap but requires an overhead of 3 bits i.e., for 7 bit code 2(start, stop bits) + 1 parity bit implying 30% overhead. However this percentage can be reduced by sending larger blocks of data but then timing errors between receiver and sender cannot be tolerated beyond [50/number. of bits in block]%. It will not only result in incorrect sampling but also misaligned bit count. i.e., a data bit can be mistaken for stop bit if receiver's clock is faster.

Synchronous

Larger blocks of bits are successfully transmitted. Blocks of data are either treated as sequence of bits or bytes. To prevent timing, drift clocks at two ends need to be synchronized. This can be done in two ways.

1. Provide a separate clock line between receiver and transmitter. (or)
2. Clocking information is embedded in data signal i.e., Biphase coding for digital signals.

Still another level of synchronization is required so that receiver determines beginning or end of block of data. Hence each block begins with a start code and end with a stop code. These are in general same, known as flag that is unique sequence of fixed number of bits. In addition some control characters encompass data within these flags. Data and control information is called a frame. Since any arbitrary bit pattern can be transmitted, there is no assurance that bit pattern for flag will not appear inside the frame, thus destroying frame stuffing.

Channel Allocation A large class of networks is built on broadcast channels, a number of stations will share the same channel, if one station sends, all other stations have to hear it.

Problem occurs when, 2 stations want to start data transmission at the same time, in this situation 2 fames collide.

To avoid frame collision, allocate the channel to one of the stations.

There are 3-strategies for channel allocation:

1. Let a station try to use the channel, and when the collision occurs, that is taken care of later.
2. Each station in turn is allowed to use the channel. This is applied in token-based systems. Only the station that has the token can use the channel.
3. Reserve the channel in prior, It is used in slotted systems. The problem is how to make a reservation.

Data Link Layer

Data link layer provides interface to the network layer, determines the number of bits of the physical layer to be grouped into frames, detects transmission error and regulates the flow of frames.

Functions of data link layer:

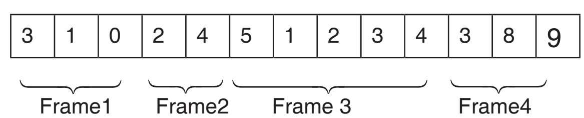
1. Framing
2. Physical addressing
3. Flow control
4. Error control
5. Access control

Various methods of Framing are

1. Time gaps
2. Character count
3. Starting and ending characters, with character stuffing
4. Starting and ending flags, with bit stuffing
5. Physical layer coding violations

Time gaps Framing is done by inserting time gaps between frames, very similar to the way of spacing between words in ordinary text. It is risky to count on timing to mark the start and end of each frame.

Character count It uses a field in the header to specify the number of characters in the frame. Thus at the destination by seeing the character count it knows how many characters follows and where the end of the frame exists.



Problem If count of any frame changes, destination will get out of synchronization and is unable to locate start of next frame.

Starting and ending characters, with character stuffing Each frame starts with the ASCII character sequence DLESTX and ends with the sequence DLEETX. If destination looses track of the frame boundaries, all it has to do is to look for DLESTX or DLEETX character

Starting and ending flags, with bit stuffing

Bit Stuffing: Suppose ou r flag bits are 01111110. So the transmitter will always insert an extra 0 bit after each occurrence of five 1s (except for flags). After detecting a starting flag the receiver monitors the bit stream. If pattern of five 1's appear, the sixth bit is examined and if it is 0 it is deleted; else if it is 1 and next bit is 0 the combination is accepted as a flag. Similarly byte stuffing is used for byte oriented transmition. Here we use an escape sequence to prefix a byte similar to flag and two escape sequences if byte itself is an escape sequence.

Has arbitrary number of bits and allows character codes with an arbitrary number of bits per character. Every frame begins and ends with a special bit pattern, 01111110, called a flag byte.

As soon as the sender's data link layer encounters five consecutive one's in the data, it stuffs a 0 bit into the outgoing bit stream.

Receiver de-shifts the 0 bit of the five consecutive incoming 1 bits, followed by a 0 bit.

If the user data is 01111110, transmitted as 011111010 but stored at receiver as 01111110.

Physical layer coding violations Applied to the networks in which the encoding on the physical medium contains some redundancy.

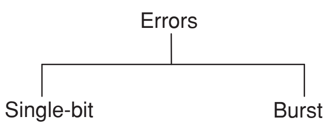
1 → high – low pair

0 → low – high pair

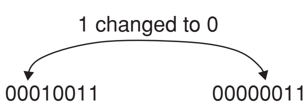
Here high-high, low-low not used for data.

Every data bit has a transition in the middle, thus easy for the receiver to locate the bit boundaries.

Types of Errors



Single bit error The term single bit error means that only one bit in the data unit has changed, it can either be from 1 to 0 or from 0 to 1.



Single bit error correction

A single bit error occurs when a bit changes in value from 0 to 1 (or) from 1 to 0 while storing (or) while performing read (or) write operation. If that error bit is identified, that can be corrected by complementing.

Hamming codes

In hamming codes, K parity bits are added to an n-bit data word, that forms a new word of $(n + k)$ bits. The bit positions are numbered in sequence from 1 to $n + k$. These positions numbered with powers of 2 are reserved for the parity bits; the remaining bits are the data bits.

Example: Consider the given 8-bit data word 11000100, we include four party bits with this word and arrange the bits as follows.

Bit position

1	2	3	4	5	6	7	8	9	10	11	12
$P1$	$P2$	1	$P4$	1	0	0	$P8$	0	1	0	0

The parity bits are in positions, 1, 2, 4, 8. Each parity bit is calculated as

$P1$ = XOR of bits (3, 5, 7, 9, 11) = $1 \oplus 1 \oplus 0 \oplus 0 \oplus 0 = 0$

$P2$ = XOR of bits (3, 6, 7, 10, 11) = 0

$P4$ = XOR of bits (5, 6, 7, 12) = 1

$P8$ = XOR of bits (9, 10, 11, 12) = 1

⇒ If there is odd number of 1s, XOR gives 0

⇒ If there is even number of 1s, XOR gives 1

The values $P1 = 0$, $P2 = 0$, $P4 = 1$, $P8 = 1$ are substituted in 12-bit composed word

Bit position

1	2	3	4	5	6	7	8	9	10	11	12
0	0	1	1	1	0	0	1	0	1	0	0

Check for errors:

$C1$ = XOR of bits (1, 3, 5, 7, 9, 11)

$C2$ = XOR of bits (2, 3, 6, 7, 10, 11)

$C4$ = XOR of bits (4, 5, 6, 7, 12)

$C8$ = XOR of bits (8, 9, 10, 11, 12)

Since the bits were written with even parity, the result $C = C8\ C4\ C2\ C1 = 0000$

∴ Indicates that no error has occurred.

- The code can be used with words of any length.

Burst Error The term burst means that two or more bits in the data unit have changed, either changed, from 1 to 0 or changed from 0 to 1.

Sent:

010011010000-sent bits corrupted by burst error

010001111000 Received

Parity bit

Parity bit is an error detecting code. This bit is added to data words depending on number of 1's in the data word; It could be even parity and odd parity.

n-bit data word is transformed to $(n + 1)$ bit code word with the addition of a bit. Even parity makes even number of 1's in a code word, similarly odd parity makes odd number of 1's in a code word.

Let us illustrate with example

Data word – 1 0 1 1 Parity bit

Code word – 1 0 1 1 1 parity bit (even parity)

Code word: 1 0 1 1 0 (odd parity)

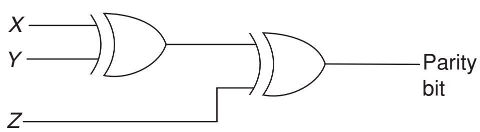
At the receiver side, when the code is received, the receiver checks the same as it is done by the generator. But here it adds all the bits which results in syndrome. If the syndrome is 0 then the number of 1's in code word is even, else number of 1's is odd.

Decision logic analyzer will decide, whether the code word is correct or not, based on syndrome value.

Parity bit generator

The parity bit generator for a 3-bit data word is given below.

The message is in the form of $X\,Y\,Z$



Parity bit generator

When the message is passed through the above circuit, the parity will be generated accordingly.

Error correction code

When data is transmitted form the source to destination, there is a chance of error introduction into the data. Error detection will detect the errors in data, while error correction will rebuild the original data,

Error correction code can be implemented in 2 ways

1. Forward error correction (FEC)
2. Automatic repeat request (ARQ)

In FEC, when sender is sending data, sender adds redundant data (encoded information) to the original data. At the receiver side this redundant data is used to recover the original data, when original data is tampered [error data].

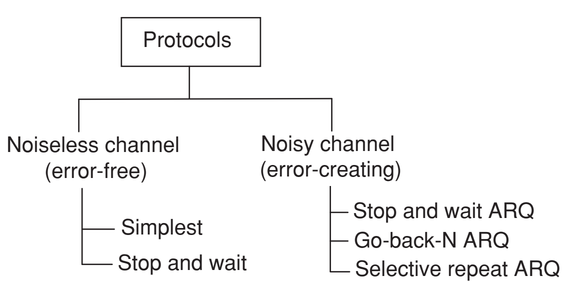
In ARQ, the receiver requests for the retransmission of the data packets, which are corrupted. Receiver will check the data using some error detection code.

Flow Control

It regulates the flow of frames so that slow receivers are not affected by the fast sender or vice versa.

It tell the sender how much data it should transmit before it waits for an acknowledgement from the receiver. Flow control refers to a set of procedures used to restrict the amount of data that the sender can send before waiting for acknowledgement.

Error control in the data link layer is often implemented simply. Any time an error is detected in an exchange, specified frames are retransmitted. This process is called automatic repeat request (ARQ).



All the protocols we discuss as unidirectional in the sense that data frames travels from sender to receiver. Although special frames called acknowledgment (ACK) and negative acknowledgment (NAK) can flow in the opposite direction for flow and error control purposes, data flow is in only one direction. In real life network, the data link protocols are implemented as bidirectional, data flow in both directions. In these protocols flow and error control information such as ACKs and NAKs are included in the data frames in a technique called piggybacking.

Stop and wait Sender sends one frame, stops until it receives confirmation from the receiver. Error correction in stop and wait ARQ is done by keeping a copy of the sent frame and retransmitting the frame when the timer expires.

Only 2 sequence numbers 0 and 1 are used.

Window size is 1.

No ACK for lost or damaged frames.

$$\text{Throughput} = \frac{\text{One packet}}{RTT}$$

$$\text{Utilization} = \frac{L}{L+BR}$$

L = packet length

B = Bandwidth

R = RTT

If $L < BR$, Efficiency > 50

$L > BR$, Efficiency = 50

$$\mu = \frac{1}{1+2a},\quad a = \frac{\text{propagation time}}{\text{Transmission time}}$$

Link utilization is low in stop and wait.

GBN protocol We can send several frames before receiving acknowledgements; we keep a copy of these frames with the acknowledgment.

- Sequence numbers ranges from $2^m - 1$.
- m – number of bits for sequence numbers.
- The sender window slides one or more slots when a valid acknowledgment arrives.
- It uses cumulative acknowledgement or piggy backing wherever possible to acknowledge the frames.
- It discards duplicate and out of order packets.
- Receiving window size is 1.
- If the sender receives a NAK, it resends all frames in the sender window.

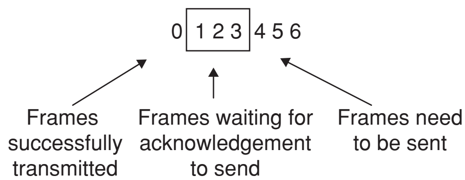
If a single packet is lost, damaged or acknowledgement is lost, it will resend all the packets.

$$\text{Link efficiency} = \frac{1-p}{1-p+p^w}$$

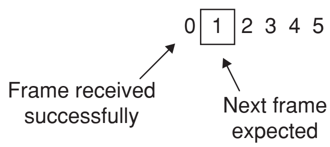
Where, p is the packet loss probability

w is the sender's window size.

Sender:



Receiver:



- If N is maximum sequence number, then sender window size = N, Receiver window size = 1.
- If N is the number of sequence number, sender window size = $N - 1$, Receiver window size = 1.

Selective repeat More efficient for noisy links but processing at the receiver is more complex. Receiver window size is same as of sender window size. Sender window maximum size is 2^{m-1}, receiver window maximum size is 2^{m-1}. Sender and receiver window must be at most one half of 2^m.

Receives out of order packets because receiver's window size is greater than 1.

It uses cumulative or independent or piggyback ACK whenever possible. If sender receives a NAK, it resends just the frame specified by the NAK.

If N is maximum sequence number,

$$\text{Sender window size } = \frac{N+1}{2},$$

$$\text{Receiver window size } = \frac{N+1}{2}$$

If N is the number of sequence numbers, sender window size $= \frac{N}{2}$, Receiver window size $= \frac{N}{2}$.

Medium Access Control Sublayer

Multiplexing

When two communicating nodes are connected through a media, it generally happens that bandwidth of media is several times greater than that of the communicating nodes. Transferring of a single signal at a time is both slow and expensive. The whole capacity of the link is not utilized in this case. This link can be further exploited by sending several signals combined into one. This combining of signals into one is called multiplexing.

Frequency Division Multiplexing (FDM)

This is possible in the case where transmission media has a bandwidth higher than the required bandwidth of signals to be transmitted. A number of signals can be transmitted at the same time. Each source is allotted a frequency range in which it can transfer it's signals, and a suitable frequency gap is given between two adjacent signals to avoid overlapping. This type of multiplexing is commonly seen in the cable TV networks.

Time Division Multiplexing (TDM)

This is possible when data transmission rate of the media is much higher than that of the data rate of the source. Multiple signals can be transmitted if each signal is allowed to be transmitted for a definite amount of time. These time slots are so small that all transmissions appear to be in parallel.

Synchronous TDM Time slots are pre. Assigned and are fixed. Each source is given it's time slot at every turn due to it. This turn may be once per cycle or several turns per cycle, if it has a high data transfer rate, or may be once in a number of cycles if it is slow. This slot is given even if the source is not ready with data. So this slot is transmitted empty.

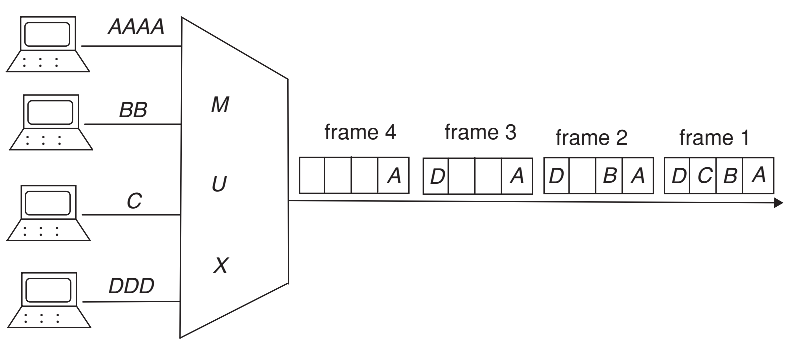


Figure 5 Synchronous TDM: Multiplexing process

Asynchronous TDM In this method, slots are not fixed. They are allotted dynamically depending on speed of sources and whether they are ready for transmission.

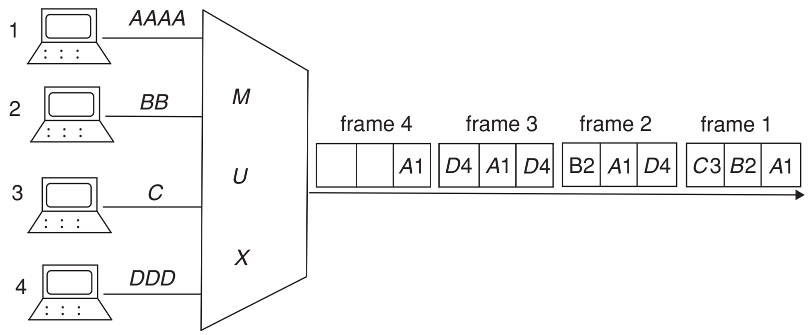

Figure 6 Asynchronous TDM

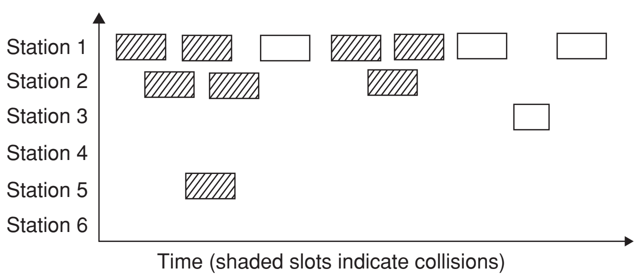
Aloha Protocols

The Aloha Protocol was designed to provide data transmission between computers on several islands using radio transmission.

Pure aloha

Pure Aloha is an unslotted, fully decentralized protocol. It is extremely simple and trivial to implement. The ground rule is 'when you want to talk, just talk!' So, a node which wants to transmit, will go ahead and sends the packet on its broadcast channel, with no consideration of who so ever to any body else is transmitting (or) (not).

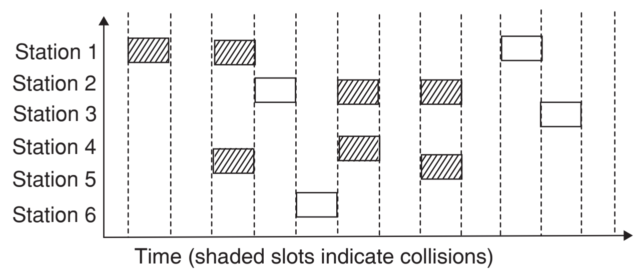


One serious drawback here is that, you don't know whether what you are sending, has been received properly or not. To resolve this in pure Aloha, when one node finishes speaking it expects an acknowledgement in a finite amount of time otherwise it simply retransmits the data. This scheme works well in small networks where the load is not high. But in large, load intensive networks where many nodes may want to transmit at the same time, this scheme fails miserably. This led to the development of slotted Aloha.

Slotted Aloha

This is quite similar to pure Aloha, differing only in the way transmissions take place. Instead of transmitting right at the demand time, the sender waits for some time. This delay is specified as follows–the timeline is divided into equal slots and then it is required that transmission should take place only at slot boundaries. To be more precise, the slotted Aloha makes the following assumptions.

- All frames consist of exactly L bits.
- Time is divided into slots of size L/K seconds. (i.e., a slot equals the time to transmit one frame)
- Nodes start to transmit frames only at the beginning of slots.
- The nodes are synchronized so that each node knows when the slots begin.
- If two or more frames collide in a slot, then all the nodes detect the collision event before slot ends.



In this, way the number of collisions that can possibly take place is reduced by a huge margin. And hence, the performance became much better compared to pure Aloha. Collisions may only take place with nodes that are ready to speak at the same time.

Virtual private network

Virtual Private Networking (VPN) Internet protocol security (IP sec) is one of the most complete, secure, standards-based protocol developed for transporting data.

A VPN is a shared network, where private data can be accessed only by the intended recipient.

The term VPN is used to describe a secure connection over the Internet.

VPN is also used to describe private networks such as Frame Relay and Asynchronous Transfer Mode (ATM).

The purpose of data security is that the data flowing across the network is protected by encryption technologies.

IP sec-based VPNs use encryption to provide data security, that increases the networks resistance to data tampering.

IP sec-based VPNs can be created over any type of IP Network, including Internet, ATM, Frame Relay, among all only Internet is inexpensive.

Uses of VPN

Intranets Intranets connect an organization's locations. These locations could be head quarters offices, branch offices, Employees home which is located in some Remote area.

This connectivity is used for e-mails, sharing files etc.

The cost of connecting remote home users is very expensive compared to Internet access technologies because of this organizations have moved their networks to the Internet.

Remote access It enables telecommuters and mobile workers to access e-mail and business applications.

A dial-up connection to an organizations modem pool is one method to access remote workers. It is expensive, because of long distance telephone and service costs.

IP sec

IP sec is an Internet Engineering Task Force (IETF) standard suite of protocols that provide data authentication, integrity, and confidentiality between 2 communication points across IP-Network.

It provides data security at the IP-packet level.

IP sec protects against possible security exposures by protecting data while in transit.

Features

IP sec was designed to provide the following security features when transferring packets across networks.

1. Authentication: Verifies that the packet received is actually from the correct sender or not.
2. Integrity: Ensures that the contents of packet did not change while transmitting data.
3. Confidentiality: Conceals the message content through encryption.

Components of IP sec

ESP: (Encapsulating security payload), It provides confidentiality, authentication and integrity.

AH: (Authentication Header) provides Authentication and Integrity.

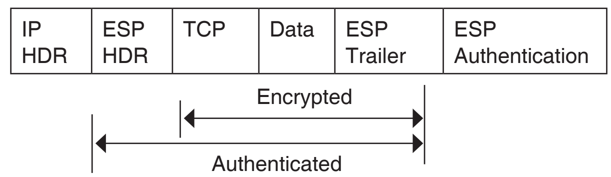
IKE: (Internet key Exchange) provides key management and security Association (SA) management.

ESP:

- Most importantly, it provides message content protection.
- IP sec provides an open frame work for implementing standard algorithms such as SHA and MD5.
- The algorithms IP sec uses produces a unique identifier for each packet, which is a data equivalent to a finger print.
- This Finger Print allows the device to determine whether a packet has been tampered with.
- Packets that are not authenticated are discarded and not delivered to the intended receiver
- ESP also provides all encryption services in IP sec.
- Encryption/decryption allows only the sender and the authorized receiver to read the data.
- The authentication performed by ESP is called ESP authentication.
- ESP provides authentication and integrity for the payload and not for the IP-header

IP HDR	TCP	Data

Figure 7 Original packet



The ESP Header is inserted into the packet between the IP-header and any subsequent packet contents.

- ESP encrypts the data, the payload is changed.
- ESP does not encrypt the ESP header, nor does it encrypt the ESP authentication.

AH:

Provides optional anti-replay protection, which protects against unauthorized retransmission of packets.

The authentication header is inserted into the packet between the IP-header and any sub sequent packet contents.

AH does not protect the data's confidentiality.

For added protection in certain cases, AH and ESP can be used together.

Exercises

Practice Problems I

Directions for questions 1 to 15 Select the correct alternative from the given choices.

1. Assume that, in a stop and wait ARQ system, the bandwidth of the line is 1 mbps, and 1 bit takes 20 ms to make a round trip. What is the bandwidth delay product utilization percentage of the link if we send 1000 bits?
(A) 1% (B) 5%
(C) 10% (D) 50%

2. A channel has a bit rate of 20 kbps and propagation delay of 100 msec. For what size does stop and wait gives an efficiency of 50%?
(A) 2000 bits (B) 3000 bits
(C) 4000 bits (D) 6000 bits

3. CSMA/CD LAN of 1 gbps is to be designed over 1 km cable without repeater. The minimum frame size that Data link layer should consider, if cable support signal speed of 20,000 km/sec

(A) 10 k bits (B) 20 k bits
(C) 30 k bits (D) 40 k bits

4. A 20 mbps satellite link has a propagation delay of 400 µs. The transmitter employs the 'go-back-n ARQ' scheme with n set to 10. Assuming each frame is 100 bytes long. What is the maximum data rate possible?
(A) 1 mbps (B) 2 mbps
(C) 5 mbps (D) 10 mbps

5. A satellite channel has capacity of B bits/sec, the frame size is of L bits, and round trip propagation time of R sec, uses stop and wait protocol, what is the channel utilization?
(A) $\frac{L}{L-BR}$ (B) $\frac{L}{L+BR}$
(C) $\frac{L}{B+R}$ (D) $\frac{L}{B-R}$

6. Find efficiency of the ring where data rate of link is 4 mbps, number of stations are 20 separated by 100 meters and bit delay in each station is 2.5 bits. (velocity of propagation = 2×10^8 m/s)
(A) 60 bits (B) 75 bits
(C) 90 bits (D) 120 bits

7. If you are designing sliding window protocol of 1 mbps which has one way delay of 1.25 seconds. Assuming each frame carries 1 kB of data, what is the minimum number of bits you need for the sequence number?
(A) 8 (B) 9
(C) 10 (D) 12

8. What are the sequence numbers of sender and receiver windows in Go-back-n and selective repeat if m-bits are used?
(A) 2^m–1,1, 2^{m-1}, 2^{m-1} (B) 2^m, 1, 2^{m-1}, 2^{m-1}
(C) 2^m, 2, 2^m, 2^m (D) 2^m–1,1, 2^m, 2^m

9. A 100 km long cable runs at 1.536 mbps. The propagation speed in the cable is 2/3 of speed of light. Number of bits fit in the cable would be?
(A) 428 bits (B) 526 bits
(C) 672 bits (D) 768 bits

10. If the bandwidth of the link is 256 mbps, Assume that sequence number field consists 32 bits. Find the wrap around time for sequence numbers?
(A) 128 sec (B) 256 sec
(C) 512 sec (D) 1024 sec

11. After a series of collisions a station has selected slot 984. In how many successive collisions, the station was a part of communication?
(A) 4 (B) 6
(C) 8 (D) 10

12. There are 10 stations in a LAN always having constant load and ready to transmit. During any particular contention slot each station transmits with a probability of 0.1. If the average frame takes 122 ms to transmit, what is the channel efficiency, if round trip time is 51.2 micro secs?
(A) 0.23 (B) 0.35
(C) 0.48 (D) 0.56

13. Which of the below are issues concerning data link layer?
(i) Ensures that the transmission facility is free of undetected transmission errors
(ii) Regulates the transmission rates so as to match the receiver's capabilities
(iii) Ensures the design of the line such that when a '1' bit is sent it is always received as '1' bit at receivers end.
(A) (i), (ii) (B) (ii), (iii)
(C) (iii), (i) (D) (i), (ii), (iii)

14. An Ethernet LAN has the capability of 100 Mbps. If Manchester encoding is used, what is the rate of signal change?
(A) 20 million times/sec
(B) 200 million times/sec
(C) 50 million times/sec
(D) 500 million times/sec

15. For 10 Mbps LAN it is found that 64 bytes is the minimum frame size to aid in collision detection. What should be the minimum frame size for a 100 Mbps LAN?
(A) 6.4 bytes (B) 64 bytes
(C) 640 bytes (D) 6400 bytes

Practice Problems 2

Directions for questions 1 to 15 Select the correct alternative from the given choices.

1. What is the probability of success for any arbitrary station among 'N' stations to transmit in CSMA/CD?
(A) $Np_s(1-p_s)^N$ (B) $(N-1)p_s\ (1-p_s)$
(C) $Np_s(1-p_s)^{N-1}$ (D) $Np_s(1-p_s)^N$

2. If 4-bits are used to represent sequence numbers for flow control. What are sender and receiver window sizes in Go-back-n and selective repeat?
(A) 16, 1, 8, 8 (B) 15, 1, 8, 8
(C) 15, 2, 8, 8 (D) 15, 1, 16, 8

3. If the available maximum sequence number is 13, compute sender and receiver window sizes in go-back-n and selective repeat?
(A) 4, 1, 4, 4 (B) 4, 1, 7, 7
(C) 13, 1, 7, 7 (D) 13, 1, 4, 4

4. In a gigabit ethernet LAN, the receiver couldn't empty the input buffer on some line for 1 millisecond. What is the maximum accumulation of frames possible neglecting propagation delays?

(A) 1024 frames (B) 2097 frames
(C) 4096 frames (D) 5120 frames

5. A Token ring LAN is using differential Manchester encoding. If the LAN speed is 10 Mbps. What is the baud rate?
(A) 10 M baud (B) 20 M baud
(C) 5 M baud (D) 100 M baud

6. Consider a 100-meter 10 mbps token ring containing 10 stations, each transmitting with equal priority. Each station can transmit 4 bytes before giving up the token. Token holding time per station is 10 ns. Also propagation speed is 200 m/s. Assume that the Ring monitor has created a new token, how long does it take for the token to come back to the Ring monitor if no station uses the token?
(A) 2.55 μsec (B) 3.64 μsec
(C) 4.65 μsec (D) 2.93 μsec

7. In the above question, if only 6 nodes including Ring monitor are active what is total propagation delay in μsec?
(A) 3.60 (B) 3.61
(C) 3.62 (D) 3.63

8. In the above case if bit regeneration time is 1 ns/bit. What is the regeneration overhead caused if a 4 kB token is taken by 1st node and if it uses to transmit 4B data to ring monitor.
(A) 412 ns (B) 544 ns
(C) 640 ns (D) 800 ns

9. Which of the below operation is applied to full-duplex mode operation of gigabit Ethernet?
(i) Traffic is allowed in both directions at any time.
(ii) CSMA/CD protocol is used.
(iii) Maximum length of cable segment used to connect stations is limited by CSMA/CD protocol.
(A) (i) and (ii) (B) (ii), (iii)
(C) (iii), (i) (D) (i), (ii), (iii)

10. Which of the below are not applied to Token Ring networks?
(i) Collisions
(ii) Limits on length of the cable segment
(iii) Time slots for transmission
(iv) Usage of repeaters
(A) (i), (ii) (B) (ii), (iii)
(C) (iii), (iv) (D) (i), (iv)

11. Select the correct statements from below (pertaining to Ethernet):
(i) Frame collisions don't occur at a repeater
(ii) Frame collisions can occur at the hub itself
(iii) Switch frames are never lost due to collisions
(iv) Entire bridge is a point of collisions
(A) (i), (ii), (iii) (B) (ii), (iii), (iv)
(C) (i), (iii), (iv) (D) (i), (ii), (iv)

12. Match the different layers with possible security methods in those layers.

(p) Data link layer	(i) user authentication
(q) Network layer	(ii) use firewalls
(r) Transport layer	(iii) encryption of connections
(s) Application layer	(iv) point to point encryption of data stream

(A) p – i, q – ii, r – iii, s – iv
(B) p – ii, q – iv, r – iii, s – i
(C) p – iv, q – ii, r – iii, s – i
(D) p – iii, q – iv, r – ii, s – i

13. The hamming distance between 001111 and 010011 is
(A) 1 (B) 2
(C) 3 (D) 4

14. Which of the following represents the polynomial $x^5 + x^4 + x^0$ using the CRC?
(A) 110000 (B) 110001
(C) 110010 (D) 110101

15. For a sliding window of size n–1 (n sequence number) there can be maximum of how many frames sent but unacknowledged?
(A) 0 (B) $n - 1$
(C) n (D) $n + 1$

Previous Years' Questions

1. The message 11001001 is to be transmitted using the CRC polynomial $x^3 + 1$ to protect it from errors. The message that should be transmitted is: **[2007]**
(A) 11001001000 (B) 11001001011
(C) 11001010 (D) 110010010011

2. The distance between two stations M and N is L kilometers. All frames are K bits long. The propagation delay per kilometer is t seconds. Let R bits/second be the channel capacity. Assuming that processing delay is negligible, the minimum number of bits for the sequence number field in a frame for maximum utilization, when the sliding window protocol is used, is: **[2007]**

(A) $\left\lceil \log_2 \frac{2LtR+2k}{k} \right\rceil$ (B) $\left\lceil \log_2 \frac{2LtR}{k} \right\rceil$

(C) $\left\lceil \log_2 \frac{2LtR+k}{k} \right\rceil$ (D) $\left\lceil \log_2 \frac{2LtR+k}{2k} \right\rceil$

3. Match the following:
(P) SMTP (1) Application layer
(Q) BGP (2) Transport layer

(R) TCP (3) Data link layer
(S) PPP (4) Network layer
(5) Physical layer

[2007]

(A) P–2 Q–1 R–3 S–5
(B) P–1 Q–4 R–2 S–3
(C) P–1 Q–4 R–2 S–5
(D) P–2 Q–4 R–1 S–3

4. A layer-4 firewall (a device that can look at all protocol headers up to the transport layer) CANNOT **[2011]**

(A) Block entire HTTP traffic during 9.00PM and 5.00PM
(B) Block all ICMP traffic
(C) Stop incoming traffic from a specific IP address but allow outgoing traffic to the same IP address
(D) Block TCP traffic from a specific user on a multi-user system during 9.00PM and 5.00AM.

5. If two fair coins are flipped and at least one of the outcomes is known to be a head, what is the probability that both outcomes are heads? **[2011]**

(A) 1/3 (B) 1/4
(C) 1/2 (D) 2/3

6. Which of the following transport layer protocols is used to support electronic mail? **[2012]**

(A) SMTP (B) IP
(C) TCP (D) UDP

7. Consider a source computer (S) transmitting a file of size 10^6 bits to a destination computer (D) over a network of two routers (R_1 and R_2) and three links (L_1, L_2 and L_3). L_1 connects S to R_1; L_2 connects R_1 to R_2; and L_3 connects R_2 to D. Let each link be of length 100 km. Assume signals travel over each link at a speed of 10^8 meters per second. Assume that the link bandwidth on each link is 1 Mbps. Let the file be broken down into 1000 packets each of size 1000 bits. Find the total sum of transmission and propagation delays in transmitting the file from S to D? **[2012]**

(A) 1005 ms (B) 1010 ms
(C) 3000 ms (D) 3003 ms

8. Determine the maximum length of the cable (in km) for transmitting data at a rate of 500 Mbps in an Ethernet LAN with frames of size 10,000 bits. Assume the signal speed in the cable to be 2,00,000 km/s. **[2013]**

(A) 1 (B) 2
(C) 2.5 (D) 5

9. Consider a token ring network with a length of 2 km having 10 stations including a monitoring station. The propagation speed of the signal is 2×10^8 m/s and the token transmission time is ignored. If each station is allowed to hold the token for 2 μsec, the minimum time for which the monitoring station should wait (in μsec) before assuming that the token is lost is ______ **[2014]**

10. Consider the store and forward packet switched network given below. Assume that the bandwidth of each link is 10^6 bytes/sec. A user on host A sends a file of size 10^3 bytes to host B through routers R_1 and R_2 in three different ways. In the first case a single packet containing the complete file is transmitted from A to B. In the second case, the file is spilt into 10 equal parts, and these packets are transmitted from A to B. In the third case, the file is spilt into 20 equal parts, and these packets are sent from A to B. Each packet contains 100 bytes of header information along with the user data. Consider only transmission time and ignore processing, queuing and propagation delays. Also assume that there are no errors during transmissions. Let T_1, T_2 and T_3 be the times taken to transmit the file in the first, second and third case respectively. Which one of the following is CORRECT? **[2014]**

(A) $T_1 < T_2 < T_3$
(B) $T_1 > T_2 > T_3$
(C) $T_2 = T_3$, $T_3 < T_1$
(D) $T_1 = T_3$, $T_3 > T_2$

11. In the following pairs of OSI protocol layer/ sub-layer and its functionality the INCORRECT pair is **[2014]**

(A) Network layer and Routing
(B) Data Link Layer and Bit synchornization
(C) Transport layer and End-to-end process communication
(D) Medium Access Control sub-layer and Channel sharing

12. A bit-stuffing based framing protocol uses an 8-bit delimiter pattern of 01111110. If the output bit-string after stuffing is 01111100101, then the input bit-string is **[2014]**

(A) 0111110100 (B) 0111110101
(C) 0111111101 (D) 011111111

13. Suppose that the stop-and-wait protocol is used on a link with a bit rate of 64 kilobits per second and 20 milliseconds propagation delay. Assume that the transmission time for the acknowledgement and the processing time at nodes are negligible. Then the minimum frame size in bytes to achieve a link utilization of at least 50% is _______ **[2015]**

14. A link has a transmission speed of 10^6 bits/sec. It uses data packets of size 1000 bytes each. Assume that the acknowledgement has negligible transmission delay, and that is propagation delay is the same as the data propagation delay. Also assume that the processing delays at nodes are negligible. The efficiency of the stop-and-wait protocol in this setup is exactly 25%. The value of the one-way propagation delay (in milliseconds) is _______ **[2015]**

15. Consider a CSMA/CD network that transmits data at a rate of 100 Mbps (10^8-bits per second) over a 1 km (kilometer) cable with no repeaters. If the minimum frame size required for this network is 1250 bytes, what is the signal speed (km/sec) in the cable? **[2015]**

(A) 8000 (B) 10000
(C) 16000 (D) 20000

16. Consider a LAN with four nodes S_1, S_2, S_3 and S_4. Time is divided into fixed-size slots, and a node can begin its transmission only at the beginning of a slot. A collision is said to have occurred if more than one node transmit in the same slot. The probabilities of generation of a frame in a time slot by S_1, S_2, S_3 and S_4 are 0.1, 0.2, 0.3 and 0.4, respectively. The probability of sending a frame in the first slot without any collision by any of these four stations is ______ **[2015]**

17. Consider a network connecting two systems located 8000 kilometers apart. The bandwidth of the network is 500×10^6-bits per second. The propagation speed of the media is 4×10^6 meters per second. It is needed to design a Go-Back-N sliding window protocol for this network. The average packet size is 10^7-bits. The network is to be used to its full capacity. Assume that processing delays at nodes are negligible. Then, the minimum size in bits of the sequence number field has to be _______ **[2015]**

18. Two hosts are connected via a packet switch with 10^7 bits per second links. Each link has a propagation delay of 20 microseconds. The switch begins forwarding a packet 35 microseconds after it receives the same. If 10000-bits of data are to be transmitted between the two hosts using a packet size of 5000-bits, the time elapsed between the transmission of the first bit of data and the reception of the last bit of the data in microseconds is _______ **[2015]**

19. A sender uses the Stop-and-Wait ARQ protocol for reliable transmission of frames. Frames are of size 1000 bytes and the transmission rate at the sender is 80 Kbps (1 Kbps = 1000 bits/second). Size of an acknowledgement is 100 bytes and the transmission rate at the receiver is 8 Kbps. The one-way propagation delay is 100 milliseconds. Assuming no frame is lost, the sender throughput is _____ bytes/second. **[2016]**

20. In an Ethernet local area network, which one of the following statements is **TRUE**? **[2016]**

(A) A station stops to sense the channel once it starts transmitting a frame.
(B) The purpose of the jamming signal is to pad the frames that are smaller than the minimum frame size.
(C) A station continues to transmit the packet even after the collision is detected
(D) The exponential back off mechanism reduces the probability of collision on retransmissions.

21. Consider a 128×10^3 bits/second satellite communication link with one way propagation delay of 150 milliseconds. Selective retransmission (repeat) protocol is used on this link to send data with a frame size of 1 kilobyte. Neglect the transmission time of acknowledgement. The minimum number of bits required for the sequence number field to achieve 100% utilization is ______. **[2016]**

22. A computer network uses polynomials over $GF(2)$ for error checking with 8 bits as information bits and uses $x^3 + x + 1$ as the generator polynomial to generate the check bits. In this network, the message 01011011 is transmitted as **[2017]**

(A) 01011011010 (B) 01011011011
(C) 01011011101 (D) 01011011100

23. The values of parameters for the Stop-and Wait ARQ protocol are as given below:

Bit rate of the transmission channel = 1Mbps.

Propagation delay from sender to receiver = 0.75 ms.

Time to process a frame = 0.25 ms.

Number of bytes in the information frame = 1980.

Number of bytes in the acknowledge frame = 20.

Number of overhead bytes in the information frame = 20.

Assume that there are no transmission errors. Then, the transmission efficiency (expressed in percentage) of the stop-and-wait ARQ protocol for the above parameters is ________ (correct to 2 decimal places) **[2017]**

24. Consider a binary code that consists of only four valid codewords as given below:

00000,01011,10101,11110

Let the minimum Hamming distance of the code be p and the maximum number of erroneous bits that can be corrected by the code be q. Then the values of p and q are **[2017]**

(A) p=3 and q=1
(B) p=3 and q=2
(C) p=4 and q=1
(D) p=4 and q=2

25. Consider two hosts X and Y connected by a single direct link of rate 10^6 bits/sec. The distance between the two hosts is 10.000 km and the propagation speed along the link is 2×10^8 m/sec. Host X sends a file of 50,000 bytes as one large message to host Y continuously. Let the transmission and propagation delays be p milliseconds and q milliseconds, respectively. Then the values of p and q are **[2017]**

(A) p=50 and q=100
(B) p=50 and q=400

(C) p=100 and q=50
(D) p=400 and q=50

26. Consider a simple communication system where multiple nodes are connected by a shared broadcast medium (like Ethernet or wireless). The nodes in the system use the following carrier-sense based medium access protocol. A node that receives a packet to transmit will carrier-sense the medium for 5 units of time. If the node does not detect any other transmission in this duration, it starts transmitting its packet in the next time unit. If the node detects another transmission, it waits until this other transmission finishes, and then begins to carrier-sense for 5 time units again. Once they start to transmit, nodes do not perform any collision detection and continue transmission even if a collision occurs. All transmissions last for 20 units of time. Assume that the transmission signal travels at the speed of 10 meters per unit time in the medium.

Assume that the system has two nodes P and Q, located at a distance d meters from each other. P starts transmitting a packet at time $t = 0$ after successfully completing its carrier-sense phase. Node Q has a packet to transmit at time $t = 0$ and begins to carrier-sense medium.

The maximum distance d (in meters, rounded to the closest integer) that allows Q to successfully avoid a collision between its proposed transmission and P's ongoing transmission is ______. **[2018]**

Chapter 2

Routing Algorithms

LEARNING OBJECTIVES

- *Routing algorithm basics*
- *Flooding*
- *Multipath routing*
- *Distance vector routing*
- *Link state routing*
- *Hierarchical routing*
- *Rip*
- *Ospf*
- *Congestion control techniques*
- *Traffic shaping*

Routing Algorithms Basics

The main function of network layer is routing packets from the source machine to the destination machine. The routing algorithms are part of the network layer software, responsible for deciding which output line an incoming packet should be transmitted on.

Routing algorithms can be grouped into two major classes: Non-adaptive and Adaptive.

1. Non-adaptive algorithms do not base their routing decisions on measurements or estimates of the current traffic and topology. Instead, the choice of the route to use is downloaded to the routers when the network is booted. This procedure is called static routing.
2. Adaptive algorithms, in contrast, change their routing decisions to reflect changes in the topology, and the traffic as well.

Store and Forward Packet Switching

In this Technique, the data packet will be stored at the node and it is forwarded to its next appropriate intermediate node. The next intermediate node will first store the packet in the buffer, based on the router decision, it selects an interface, and forwards to receiver.

The technique is most suitable for the networks with unsteady connectivity.

The length of the packet we take shows effect on the file transfer, if the data packet is small, in the store the forward, delay will be less at each node, but causes extra overhead with headers. So, the packet size selection should be done appropriately.

Flooding

Static algorithms, in which every incoming packet is sent out on every outgoing line except the one on which it is arrived. Header contains the hop count of each packet. Hop counter is decremented at each hop, with the packet being discarded when the counter reaches zero.

Another way for damming the flood is to keep track of which packets have been flooded, to avoid sending them out a second time. A variation of flooding that is slightly more practical is selective flooding. In this algorithm the routers do not send every incoming packet out on every line, only on those lines that are going approximately in the right direction.

Multipath Routing

Multipath routing is routing the packets from the source, on multiple paths to the destination. It is nothing but spreading the traffic.

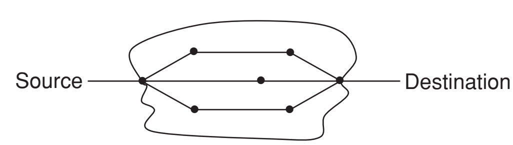

Figure 1 Multipath routing model

Single path routing causes QOS, throughput and delay problems, and multipath routing, improves network performance with sharing of available resources of network.

The components of multipath routing are

1. Multipath calculation algorithm
2. Multipath forwarding algorithm
3. End-Host protocol

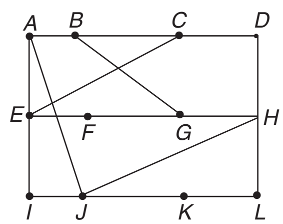
The algorithms specified above are based on Dijkstras shortest path algorithm they generate paths according to path characteristics and ensure path quality and path independence.

The end-host protocol uses the multipath (determined) effectively performance will be improved if end-users use the multiple paths effectively.

Distance Vector Routing

A dynamic routing algorithm, operates by having each router maintain a table (i.e., a vector) giving the best known distance to each destination and which line to use to get there. These tables are updated by exchanging information with the neighbors.

The Metric used might be number of hops, time delay in milliseconds, and total number of packets queued along the path or something similar.



(a)

New estimated — Delay from

	A	I	H	K	J	
A	0	24	20	21	8	A

E	14	7	30	22	17	I
F	23	20	19	40	30	I
G	18	31	6	31	18	H
H	17	20	0	19	12	H
I	21	0	14	22	10	I
J	9	11	7	10	0	-
K	24	22	22	0	6	K
L	29	33	9	9	15	k
	JA delay is 8	JI delay is 10	JH delay is 12	JK delay is 6	New routing table for J	

Vectors received from J's four neighbours.

(b)

Figure 2 (a) Subnet, (b) Delay vectors of J

Figure 2(a) 'shows a subnet. The first 4 columns of figure 2(b) shows the delay vectors received from the neighbors of router *J*. A claims to have a 12 m sec delay to *B*, a 25 m sec delay to *C*, a 40 m sec delay to D, etc.

Suppose that *J* has estimated its delay to its neighbour, *A*, *J*, *H* and *K* as 8, 10, 12 and 6 m sec, respectively.

Now *J* computes its new route to router *G*. It knows that it can get to *A* in 8 m sec, and *A* claims to be able to get to *G* in 18 m sec, so *J* knows it can count on a delay of 26 m sec to *G* if it forwards packets bound for *G* to *A*, similarly, it computes the delay to *G* via *I*, *H* and *K* as 41 (31 + 10), 18 (6 + 12) and 37 (31 + 6) m sec, respectively.

The best of these values is 18, so it makes an entry in its routing table that the delay to *G* is 18 m sec and that the route to use is via *H*.

Count to Infinity Problem

It reacts rapidly to good news, but leisurely to bad news. Actual network may be down but routers will exchange routes with one another.

Following measures are taken to avoid count-to-infinity problem:

1. **Hop limit:** Limit number of hops normally 0 hops directly connected, hop 16 is (0 – 15), 16 hops unreachable.
2. **Split horizon:** Never send information back in direction where it came from.
3. Route poisoning and poison reverse, hold on timer trigger.
4. As soon as network goes down, make metric of root infinity to resolve the immediate instability created because of routing updates from neighbor.
5. When router sends update with infinite metric to neighbor, neighbor will make it down.
6. Now routers will initiate hold on time to learn alternate paths and send update in direction where it came (Poison reverse) from.
7. Routers will incorporate final roots in routing table.

Link State Routing

The idea behind link state routing is simple and can be stated as five parts. Each router must do the following:

1. Discover its neighbors and learn their network addresses.
2. Measure the delay or cost to each of its neighbors.
3. Construct a packet telling all it has just learned.
4. Send this packet to all other routers.
5. Compute the shortest path to every other router.

Learning about the neighbors When a router is booted, its first task is to learn who its neighbors are. It accomplishes this goal by sending a special HELLO packet on each point to point line. The router on the other end is expected to send back a reply telling who it is. These names must be globally unique.

Measuring the cost The link state routing algorithm requires each router to know, or at least have a reasonable estimate of, the delay to each of its neighbors.

The most direct way to determine this delay is to send over the line a special ECHO packet that the other side is required to send back immediately.

By measuring the round trip time and dividing it by two, the sending router can get a reasonable estimate of the delay. If two paths with same bandwidth exists and one path is heavily loaded then the path which is not heavily loaded is chosen. But this may oscillate in the choice of best path. So to avoid oscillation in the choice of best path, distribute the load over multiple lines with same known fraction going over each line.

Building link state packets Once the information needed for the exchange has been collected, the next step is, for each router to build a packet containing all the data. The packet starts with identity of the sender, followed by a sequence number and age, and a list of neighbors. For each neighbor, delay to that neighbor is given.

(b)

Figure 3 (a) Subnet5, (b) Link state packets for this subnet.

Distributing the link state packets As the packets are distributed and installed, the routers getting the routing packet first will change their routes.

Consequently, the different routers may be using different versions of the topology, which can lead to inconsistencies, loops, unreachable machines, and other problems. The fundamental idea is to use flooding to distribute the link state packets. To keep the flood in check, each packet contains a sequence number that is incremented for each new packet sent. Routers keep track of all the (source router, sequence) pairs they see.

When a new link state packet comes in, it is checked against the list of packets already seen. If it is new, it is forwarded on all lines except the one it arrived on. If it is a duplicate, it is discarded.

If a packet with a sequence number lower than the highest one seen so far ever arrives, it is rejected as being obsolete since the router has more recent data.

If a router ever crashes it will lose track of its sequence number. If its starts again at 0, the next packet will be rejected as a duplicate. Also due to bit error, packets may be rejected as obsolete. Solution to these problems is to include the age of each packet after the sequence number and decrement it once per second.

When the age hits zero, the information from that router is discarded.

Computing new routes Once a router has accumulated a full set of link state packets, it can construct the entire subnet graph because every link is represented. Every link is, in fact, represented twice, once for each direction. The two values can be averaged or used separately. Now dijkstra's algorithm can be run locally to construct the shortest path to all possible destinations.

Hierarchical Routing

Hierarchical Routing is mainly designed for large topologies. With increase in the topology there is proportionate increase in the routing tables, which consume more memory for maintaining tables and requires more bandwidth for the status reports.

In this routing, network topology is divided into hierarchies, these will reduce size of routing table. The node at each hierarchy will know about the nodes present in that level. It forwards the packet to its border router (at its level) if destination is not at its level. Hierarchical routing increases efficiency in routing, less traffic, reduction of table size in an order of about (log n).

RIP

1. It calculates best route based on hop count.
2. RIP cannot handle more than 15 hops, anything above 15 hops away is considered unsearchable by RIP. This fact is used by RIP to prevent routing loops.
3. RIP is a classful routing protocol.
4. Interval between route update advertisements: 30 sec. Time out/hold on times: 180 sec
5. RIP implements the split horizon, route isonning and hold down mechanisms to prevent looping.
6. It is a dynamic distance vector routing protocol.

OSPF

The open shortest path first is an adaptive routing protocol for IP networking. It uses a link state routing algorithm. OSPF keeps track of the state of all the various network connections between itself and a network it is trying to send

data to. OSPF selects the best route by finding the lowest cost paths to a destination. All router interfaces are given a cost. Its domain is an autonomous system.

Backbone routers Backbone routers have one or more interfaces in Area 0 (the backbone area).

Area border router (ABR) Routers that belong to multiple areas, and connect these areas to the backbone area are called ABR. It has interfaces in multiple areas.

Autonomous system boundary router (ASBR) If the router connects the OSPF autonomous system to another autonomous system, it is called an autonomous system boundary router (ASBF).

OSPF elects two or more routers to manage the link state advertisements.

Designated router (DR) Every OSPF will have a DR, a backup DR. The DR is the route to which all other routers within the area, send their link state advertisements.

OSPF areas

OSPF areas are used to impose a hierarchical structure to the flow of data over the network. A network using OSPF will always have atleast one area and if there is more than one area, one of the two areas must be the backbone area. Areas are used to group routers into manageable groups that exchange routing information locally, but summarize the routing information, when advertising the routes externally, ABR's are used to connect the areas.

CONGESTION CONTROL TECHNIQUES

Objective of congestion control technique is to limit queue lengths at the nodes, so as to avoid throughput collapse.

1. Send a control packet from a congested node to some or all source nodes to stop or slow the rate of transmission from source and thus limit the total number. of packets in the network.
2. Allow packet switching nodes to add congestion information to packets as they pass by. The packets carrying such information can go in both the directions i.e., opposite of the congestion and in the same direction of the congestion.

   Packets in the opposite direction of congestion quickly reache the source node which can reduce the flow of packets into the network.

   Packets going in the same direction as the congestion, reaches the destination. The destination asks the source to adjust the load by returning the signal back to the source in the packets.
3. Provides link delay information to other nodes. This information can be used to influence the rate at which new packets are produced. As these delays are influenced by the routing decision, they may vary too rapidly to use effectively for congestion control.

Congestion Control

Congestion control maintains the number of packets within the network below the level at which performance falls dramatically.

Every node has a queue of packets for each outgoing channel. If, rate at which packets arrive and queue up, exceeds the rate of packet transmission, then size of queue grows without bound and thus delay experienced by a packet goes to infinity.

When the packets arrive they are stored in the input buffer, of the corresponding link. The node examines each incoming packet to make a routing decision and then moves the packet to the appropriate output buffer. Packet queued up for output in output buffer is transmitted as soon as possible. When saturation point is reached, one can do any of the following:

1. Discard incoming packet for which there is no available buffer space.
2. Node should exercise some sort of flow control over its neighbors so that the traffic flow remains manageable.
3. Traffic shaping is about regulating the average rate of data transmission.

Leaky Bucket Algorithm

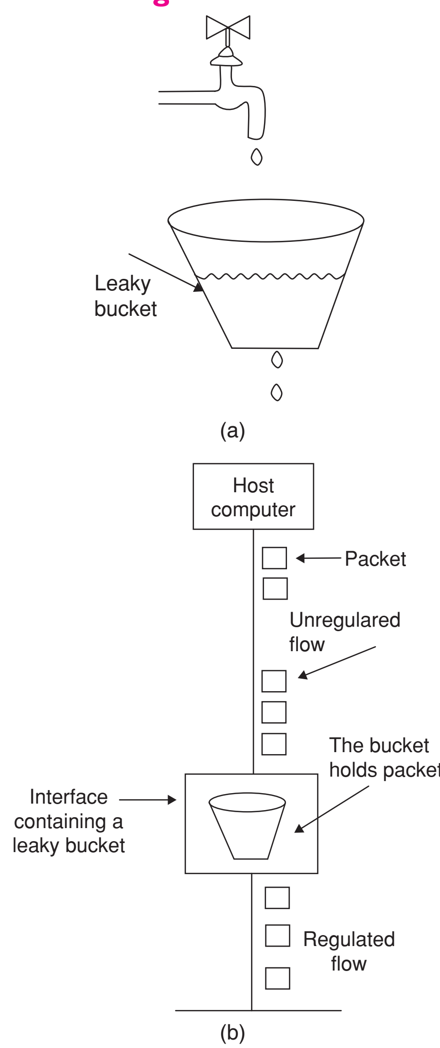

Figure 4 (a) A leaky bucket with water, (b) A leaky bucket with network

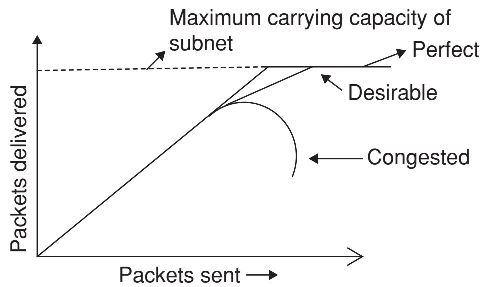
A leaky bucket is a bucket with a small hole. No matter at what rate water enters the bucket, the outflow is at constant rate, *S*, when there is any water in the bucket and zero when bucket is empty. Once the bucket is full, any additional water entering it, spills over the sides and it is lost. Each host is connected to the network by an interface containing a leaky bucket (i.e., a finite internal queue) congestion control algorithms.



When too many packets are present in the subnet, performance degrades. This situation is called congestion.

Causes of congestion

1. If all of a sudden, stream of packets are arriving on three or four input lines and all need same output line, a queue will build up.
2. Slow processor.
3. Low bandwidth line.

Token bucket

Tokens are added at a constant rate. For a packet to be transmitted, it must capture and destroy one token.

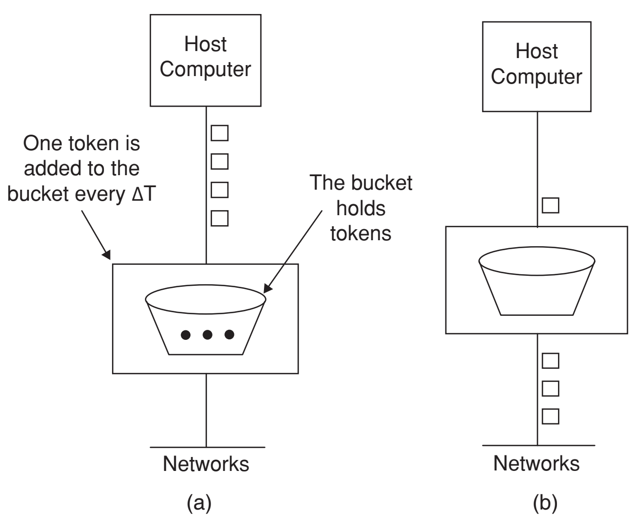


Figure 5 (a) shows that the bucket holds 3 tokens with 4 packets waiting to be transmitted, (b) shows that 3 packets have gotten through but the other one is stuck waiting for tokens to be generated.

Unlike leaky bucket, token bucket allows saving up to maximum size of bucket '*n*'.

The bursts of upto '*n*' packets can be sent at once, giving faster response to sudden bursts.

- Leaky bucket discards packets when the bucket is full, whereas token bucket throws away tokens when the bucket is full but never discards packets.
- Let Token bucket capacity be *c*(bits), token arrival rate ρ(bps), maximum output rate *M*(bps), and burst length *S*(*s*).
- During the burst length of *S*(*s*), tokens generated are ρS(bits), output burst contains a maximum of $C + \rho S$(bits)
- Output in a maximum burst of length *S*(*s*) is MS.
- $C + \rho S = MS \quad \text{(or)} \quad S = \dfrac{C}{M - P}$
- Token bucket still allows large bursts, even though the maximum burst length '*s*' can be regulated by selection of ρ and *M*.
- To reduce the peak rate, put a leaky bucket of a larger rate after the token bucket (To avoid discarding packets)

Traffic Shaping

1. One of the main causes of congestion is, that traffic is often burst.
2. If hosts could be made to transmit at uniform rate, congestion would be less.

This arrangement can be built into the network interface or simulated by the host OS. The host is allowed to put one packet per tick on the network.

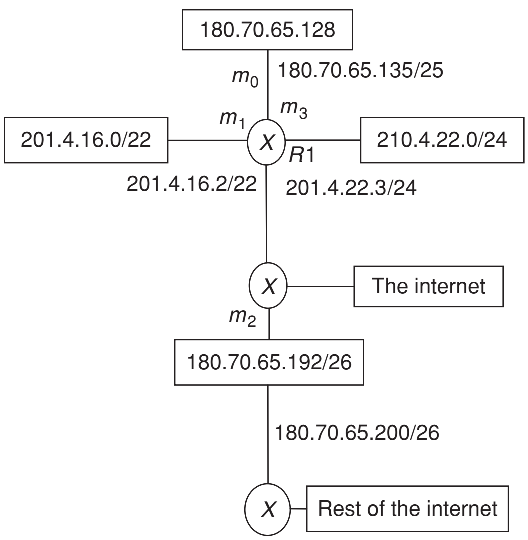
1. When the packets are all of the same size at every clock tick, one packet is transmitted.
2. When variable size packets are used.
   (i) At every tick, a counter is initialized to *n*. If the first packet on the queue has fewer bytes than the current value of the counter, it is transmitted and counter is decremented by that number of bytes.
   (ii) Additional packets may also be sent, as long as the counter is high enough.
   (iii) When the counter drops below the length of the next packet on the queue, transmission stops until the next tick, at that time the residual byte count is overwritten and lost.

Exercises

Practice Problems 1

Directions for questions 1 to 15: Select the correct alternative from the given choices.

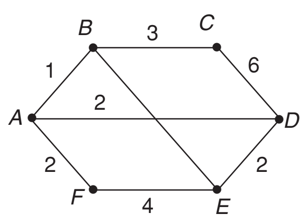
1. Consider below figure:



The network address, 180.70.65.130 goes through which of the following interface?

(A) m_0 (B) m_1
(C) m_2 (D) m_3

2. Consider below graphical representation of a subnet with each node denoting a router. If all the routers are booted at the same time, what is the number of link state packets that are generated having the cost/delay information?



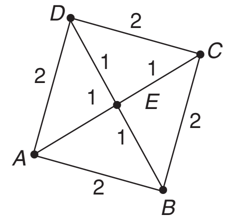
(A) 3 (B) 4
(C) 5 (D) 6

3. In a TCP connection it is found that burst size of 1024, 2048, 4096 have been transmitted while that of 8192 has resulted in a time out. The receiver has earlier set a window size of 4096. As per slow start algorithm which of the below statement is true?

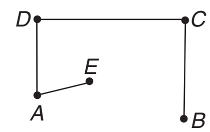
(i) Congestion window is set to 4096.
(ii) Maximum allowed burst size is 8192

(A) (i) only
(B) (ii) only
(C) Both (i) and (ii)
(D) Neither (i) nor (ii)

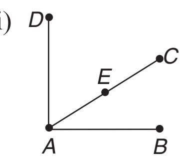
4. From the below graph select the sink tree(s):



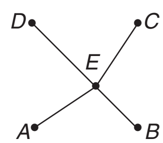
(i)



(ii)

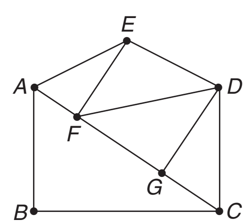


(iii)



(A) (i), (ii) (B) (ii), (iii)
(C) (i), (iii) (D) (i), (ii), (iii)

5. Consider the below graph.

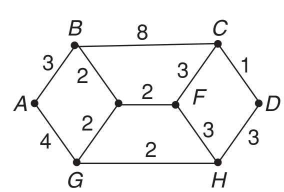


It is known that *D* is the optimal route from *A* to *C* and the optimal route from *A* to *C* has 3 hops. Which of the below statements is certainly true?

(i) *B* is not in the optimal route from *A* to *C*
(ii) *G* is not in the optimal route from *B* to *C*
(iii) Either *E* or *F* is in the optimal route from *A* to *C*
(iv) *ED*, *FD* are both optimal routes

(A) (i), (ii), (iii) (B) (ii), (iii), (iv)
(C) (i), (iii), (iv) (D) (i), (iv), (ii)

6. The shortest path using Dijkstra's algorithm after 3 iterations is



(A) A G (B) A B E
(C) A B C (D) A G H

7. There are totally 20 links among the routers of a subnet. How many rows are needed in all when link state packets

combined together, which are used to notify each other about cost/delay in transmitting data to immediate neighbours. Assume 1 row is needed for each neighbour?

(A) 10 (B) 20
(C) 40 (D) 80

8. Below are the link state packets generated by routers in a subnet. What is the shortest distance between *A* and *D*?

A	
Seq	
Age	
B	4
E	5

B

D	7
E	8

(A) 6 (B) 9
(C) 10 (D) 11

9. What are the advantages of reverse path forwarding over other broadcasting algorithms like spanning trees, multidestination routing, broadcasting, and flooding?

(i) Route does not need to know information regarding spanning tree structures
(ii) Uses destination tables for further forwarding
(iii) Does not need a halt mechanism to stop packets from further getting routed

(A) (i), (ii) (B) (ii), (iii)
(C) (i), (iii) (D) (i), (ii), (iii)

10. Which of the following specifies the correct sequence of steps to route packets to mobile hosts?

(i) Sender is given foreign agent's address
(ii) Packet is sent to mobile host's home address
(iii) Packet is tunneled to foreign agent
(iv) Subsequent packets are tunneled to the foreign agent

(A) (i), (ii), (iii), (iv)
(B) (ii), (iii), (iv), (i)
(C) (ii), (iii), (i), (iv)
(D) (iii), (iv), (i), (ii)

11. What are the different parts of congestion control by closed loop methods?

(i) Design the system in advance to make sure congestion doesn't occur in first place
(ii) Monitor the system to detect when and where congestion occurs
(iii) Pass congestion information to places where action can be taken
(iv) Adjust system operation to correct the problem

(A) (i), (ii), (iii)
(B) (ii), (iii), (iv)
(C) (iii), (iv), (i)
(D) (i), (ii), (iv)

12. In Selective flooding

(A) Packets are sent in all outgoing lines.
(B) Packets are sent in only on those lines that are approximately in the right direction.
(C) Both (A) and (B)
(D) None of these

13. There are 5 routers and 6 networks in an inter-networking, using link state routing, how many routing tables are there?

(A) 1 (B) 5
(C) 6 (D) 11

14. Congestion control for multicasting flows from multiple sources to multiple destinations, the solution that can handle this is

(A) RSVP (Resource reSerVation Protocol)
(B) Load shedding
(C) Both (A) and (B)
(D) None of these.

15. Which of the below are part of backward learning algorithm?

(i) As the bridge starts operating, a hash table to map source addresses to corresponding LANs is constructed.
(ii) It dynamically updates the hash tables when machines are connected and re connected to the LAN.
(iii) It encrypts the frames for security reasons.

(A) (i), (ii)
(B) (ii), (iii)
(C) (i), (iii)
(D) (i), (ii), (iii)

Practice Problems 2

Directions for questions 1 to 15: Select the correct alternative from the given choices.

1. What does a routing algorithm perform?
(A) Decides if incoming packet should be further corrected for transmission errors
(B) Adds checksum bits to packets
(C) Encrypts the packets
(D) Decides the output line on which the incoming packet should be transmitted

2. What happens in session routing?
(A) User's session variables are managed by the network layer
(B) Route remains same throughout the user session
(C) Packets change their route for optimization sake during user session
(D) Provides special routes for important packets

3. What is the type of algorithm that changes their routing decision based on changes in topology and traffic?
(A) Adaptive routing
(B) Static routing
(C) Non-adaptive routing
(D) Network routing

4. Which of the below routing method always ensures the shortest path even though routers crash during course of routing?
(A) Dijkstra Routing
(B) Flooding
(C) Distance Vector Routing
(D) Link State Routing

5. What is the root cause for count-to-infinity problem?
(A) The routing tables are static and are not updated.
(B) The routing tables run out of space to accommodate more entries in table.
(C) When router *X* tells router *Y* that there is a path, it doesn't say if *Y* itself is in the path.
(D) When router *X* tells router *Y* that there is a path (to target route *Z*) it doesn't inform *Z* about the path.

6. In a strict sure security path ABCD, where A, B, C, D are routers, the maximum bandwidth is found to be 500 kbps, 700 kbps, 900 kbps, 300 kbps respectively. What is the effective bandwidth if no buffering is possible?
(A) 600 kbps (B) 900 kbps
(C) 300 kbps (D) 2400 kbps

7. What is the characteristic of Distance Vector Routing?
(i) Time taken to reach other routers in the network is maintained in the routing tables.
(ii) Algorithm is susceptible to count-to-infinity problem.
(iii) The preferred outgoing line to be used for a particular destination is also stored in tables.
(A) (i), (ii) (B) (ii), (iii)
(C) (i), (iii) (D) (i), (ii), (iii)

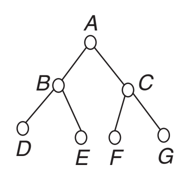
8. A subnet using link state algorithm has router, using link state packets with sequence of 16-bit fixed size. If a link state packet is sent every second, how long would it take before wrap around occurs. Assume starting sequence number is 0.
(A) 24.5 hours (B) 18.20 hours
(C) 17.5 hours (D) 16.4 hours

9. Which of the following are features of link state routing?
(i) In the first step discover all the routers in the subnet and find their network addresses.
(ii) Measure cost/delay to the neighbours.
(iii) Transmit the information as obtained in (ii) across the subnet.
(iv) Thus by pass the necessity for shortest path algorithm.
(A) (i), (ii) (B) (ii), (iii)
(C) (iii), (iv) (D) (i), (iv)

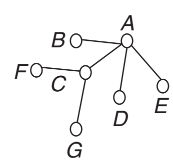
10. In multidestination routing,
(i) Each router makes new copies of the incoming packets.
(ii) It retains the same destination list in all copies.
(iii) It places them on appropriate outgoing lines.
(A) (i), (ii) (B) (ii), (iii)
(C) (iii), (i) (D) (i), (ii), (iii)

11. In a subnet which follows reverse path forwarding, routers *B* and *C* have received packets from *A* which have been further forwarded to *D* and *E* by *B* and to *F* and *G* by *C*. Of this *D*, *G* has always discarded the valid packets. Construct the preferred routing lines in the subnet.

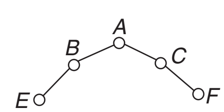
(A)



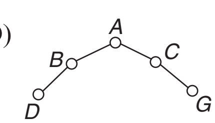
(B)



(C)



(D)



12. Which of the following layers accept services from network layer and provides services to session layer?
(A) Data link layer
(B) Presentation layer
(C) Transport layer
(D) Physical layer.

13. Which of the below are different metrics for congestion?
(i) Packets discarded for lack of buffer space
(ii) Packets that are retransmitted
(iii) Average packet delay
(iv) Average queue length
(A) (i), (ii), (iii) (B) (ii), (iii), (iv)
(C) (iii), (iv), (i) (D) (i), (ii), (iii), (iv)

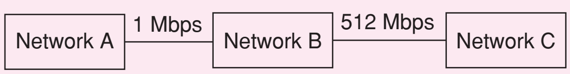
14. What are the ways to decrease congestion?
(i) Put spare routers to use
(ii) Increase bandwidth by routing on alternate lines
(iii) Increase the size of tables in the routers
(iv) Decrease the load
(A) (i), (ii), (iii) (B) (ii), (iii), (iv)
(C) (iii), (iv), (i) (D) (iv), (i), (ii)

15. The algorithm which tells the routers to maintain certain data structures in their memories for congestion control is
(A) Resource Reservation Protocol.
(B) Fair queuing algorithm.
(C) Token bucket algorithm.
(D) None of these

Previous Years' Questions

Common data for questions 1 and 2: Consider three IP networks, *A*, *B* and *C*. Host H_A in network *A* sends messages each containing 180 bytes of application data to a host H_C in network *C*. The TCP layer prefixes a 20 byte header to the message. This passes through an intermediate network *B*. The maximum packet size, including 20 byte IP header, in each network is:
A: 1000 bytes
B: 100 bytes
C: 1000 bytes

The networks *A* and *B* are connected through a 1 Mbps link, while *B* and *C* are connected by a 512 Kbps link (bps = bits per second)



1. Assuming that the packets are correctly delivered, How many bytes, including headers, are delivered to the IP layer at the destination for one application message, in the best case? Consider only data packets. **[2004]**
(A) 200 (B) 220
(C) 240 (D) 260

2. What is the rate at which the application data is transferred to host H_C? Ignore errors, acknowledgements, and other over heads. **[2004]**
(A) 325.5 kbps (B) 354.5 kbps
(C) 409.6 kbps (D) 512.0 kbps

3. In a packet switching network, packets routed from source to destination along a single path having two intermediate nodes. If the message size is 24 bytes and each packet contains a header of 3 bytes, then the optimum packet size is: **[2005]**
(A) 4 (B) 6
(C) 7 (D) 9

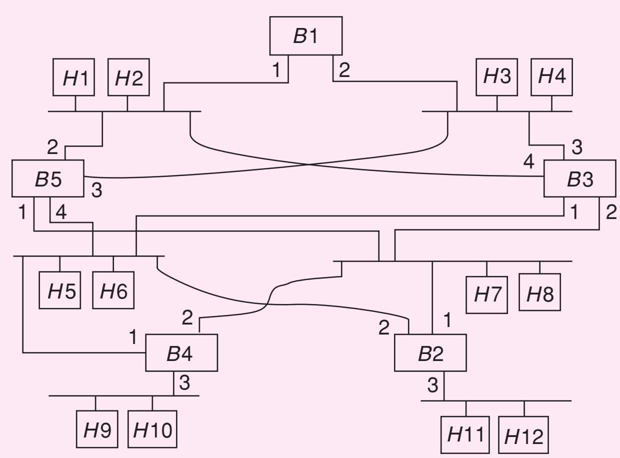
4. Suppose the round trip propagation delay for a 10 Mbps Ethernet having 48-bit jamming signal is 46.4 µs. The minimum frame size is: **[2005]**
(A) 94 (B) 416
(C) 464 (D) 512

5. Station *A* uses 32 byte packets to transmit messages to station *B* using a sliding window protocol. The round trip delay between *A* and *B* is 80 milliseconds and the bottleneck bandwidth on the path between *A* and *B* is 128 kbps. What is the optimal window size that *A* should use? **[2006]**
(A) 20 (B) 40
(C) 160 (D) 320

6. Station *A* needs to send a message consisting of 9 packets to station *B* using a sliding window (window size 3) and go-back-n error control strategy. All packets are ready and immediately available for transmission. If every 5th packet that *A* transmits gets lost (but no acks from *B* ever get lost), then what is the number of packets that *A* will transmit for sending the message to *B*? **[2006]**
(A) 12 (B) 14
(C) 16 (D) 18

Common data for questions 7 and 8: Consider the diagram shown, where a number of LANs are connected by (transparent) bridges. In order to avoid packets looping through circuits in the graph, the bridges organize themselves in a spanning tree. First, the root bridge is identified as the bridge with the least serial number. Next, the root sends out (one or more) data units to enable the setting up of shortest paths from the root bridge to each bridge.

Each bridge identifies a port (the root port) through which it will forward frames to the root bridge. Port conflicts are always resolved in favor of the port with the lower index value. When there is possibility of multiple bridges forwarding to the same LAN (But not through the root port), ties are broken as follows: bridges closest to the root get preference and between such bridges, the one with the lowest serial number is preferred.



7. For the given connection of LANs by bridges, which one of the following choices represents the depth first traversal of the spanning tree of bridges? **[2006]**
(A) B1, B5, B3, B4, B2 (B) B1, B3, B5, B2, B4
(C) B1, B5, B2, B3, B4 (D) B1, B3, B4, B5, B2

8. Consider the spanning tree for the previous question. let Host H1 send out a broadcast ping packet. Which of the following options represents the correct forwarding table on B3? **[2006]**

(A)

Hosts	Port
H1, H2, H3, H4	3
H5, H6, H9, H10	1
H7, H8, H11, H12	2

(B)

Hosts	Port
H1, H2	4
H3, H4	3
H5, H6	1
H7, H8, H10, H11, H12	2

(C)

Hosts	Port
H3, H4	3
H5, H6, H9, H10	1
H1, H2	4
H7, H8, H11, H12	2

(D)

Hosts	Port
H2, H2, H3, H4	3
H5, H7, H9, H10	1
H7, H8, 11, H12	4

9. In a token ring network the transmission speed is 10^7 bps and the propagation speed is 200 metres/μs. The 1-bit delay in this network is equivalent to: **[2007]**
(A) 500 metres of cable.
(B) 200 metres of cable.
(C) 20 metres of cable.
(D) 50 metres of cable.

10. In the slow start phase of the TCP congestion control algorithm, the size of the congestion window **[2008]**
(A) Does not increase
(B) Increases linearly
(C) Increases quadratically
(D) Increases exponentially

11. A computer on a 10 Mbps network is regulated by a token bucket. The token bucket is filled at a rate of 2 Mbps. It is initially filled to capacity with 16 Megabits. What is the maximum duration for which the computer can transmit at the full 10 Mbps? **[2008]**
(A) 1.6 seconds (B) 2 seconds
(C) 5 seconds (D) 8 seconds

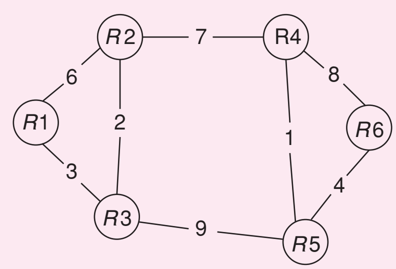
12. Let $G(x)$ be the generator polynomial used for CRC checking. What is the condition that should be satisfied by $G(x)$ to detect odd number of bits in error? **[2009]**
(A) $G(x)$ contains more than two terms
(B) $G(x)$ does not divide $1 + x^k$, for any k not exceeding the frame length
(C) $1 + x$ is a factor of $G(x)$
(D) $G(x)$ has an odd number of terms.

Common data for questions 13 and 14: Frames of 1000 bits are sent over a 10^6 bps duplex link between two hosts. The propagation time is 25 ms. Frames are to be transmitted into this link to maximally pack them in transit (within the link).

13. What is the minimum number of bits (l) that will be required to represent the sequence numbers distinctly? Assume that no time gap needs to be given between transmission of two frames. **[2009]**
(A) l = 2 (B) l = 3
(C) l = 4 (D) l = 5

14. Suppose that the sliding window protocol is used with the sender window size of 2^l, where l is the number of bits identified in the earlier part and acknowledgements are always piggy backed. After sending 2^l frames, what is the minimum time the sender will have to wait before starting transmission of the next frame? (Identify the closest choice ignoring the frame processing time.) **[2009]**
(A) 16 ms (B) 18 ms
(C) 20 ms (D) 22 ms

Common data for questions 15 and 16: Consider a network with 6 routers $R1$ to $R6$ connected with links having weights as shown in the following diagram



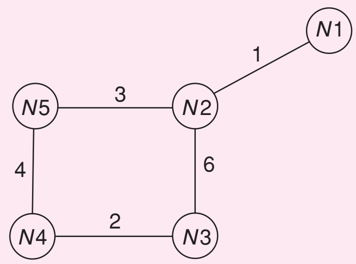
15. All the routers use the distance vector based routing algorithm to update their routing tables. Each router starts with its routing table initialized to contain an entry for each neighbour with the weight of the respective connecting link. After all the routing tables stabilize, how many links in the network will never be used for carrying any data? **[2010]**
(A) 4 (B) 3 (C) 2 (D) 1

16. Suppose the weights of all unused links in the previous question are changed to 2 and the distance

vector algorithm is used again until all routing tables stabilize. How many links will now remain unused? **[2010]**

(A) 0 (B) 1 (C) 2 (D) 3

Common data for questions 17 and 18: Consider a network with five nodes, *N*1 to *N*5 as shown below.



The network uses a distance vector routing protocol. Once the routes have stabilized, the distance vectors at different nodes are as following.

*N*1 : (0, 1, 7, 8, 4)
*N*2 : (1, 0, 6, 7, 3)
*N*3 : (7, 6, 0, 2, 6)
*N*4 : (8, 7, 2, 0, 4)
*N*5 : (4, 3, 6, 4, 0)

Each distance vector is the distance of the best known path at that instance to nodes, *N*1 to *N*5, where the distance to itself is 0. Also, all links are symmetric and the cost is identical in both directions. In each round, all nodes exchange their distance vectors with their respective neighbors. Then all nodes update their distance vectors. In between two rounds, any change in cost of a link will cause the two incident nodes to change only that entry in their distance vectors.

17. The cost of link *N*2-*N*3 reduces to 2 (in both directions). After the next round of updates, what will be the new distance vector at node, *N*3? **[2011]**

(A) (3, 2, 0, 2, 5) (B) (3, 2, 0, 2, 6)
(C) (7, 2, 0, 2, 5) (D) (7, 2, 0, 2, 6)

18. After the update in the previous question, the link *N*1-*N*2 goes down. *N*2 will reflect this change immediately in its distance vector as cost, ∞. After the NEXT ROUND of update, what will be the cost to *N*1 in the distance vector of *N*3? **[2011]**

(A) 3 (B) 9 (C) 10 (D) ∞

19. Consider an instance of TCP's Additive Increase Multiplicative Decrease (AIMD) algorithm where the window size at the start of the slow start phase is 2 MSS and the threshold at the start of the first transmission is 8 MSS. Assume that a timeout occurs during the fifth transmission. Find the congestion window size at the end of the tenth transmission. **[2012]**

(A) 8 MSS (B) 14 MSS
(C) 7 MSS (D) 12 MSS

20. Assume that source *S* and destination *D* are connected through two intermediate routers labeled *R*. Determine how many times each packet has to visit the network layer and the data link layer during a transmission from *S* to *D*. **[2013]**

(A) Network layer – 4 times and Data link layer – 4 times
(B) Network layer – 4 times and Data link layer – 3 times
(C) Network layer – 4 times and Data link layer – 6 times
(D) Network layer – 2 times and Data link layer – 6 times

21. Consider a selective repeat sliding window protocol that uses a frame size of 1 kB to send data on a 1.5 Mbps link with a one-way latency of 50 msec. To achieve a link utilization of 60%, the minimum number of bits required to represent the sequence number field is ______. **[2014]**

22. Consider the following three statements about link state and distance vector routing protocols, for a large network with 500 network nodes and 4000 links.

[*S*1] The computational overhead in link state protocols is higher than in distance vector protocols.
[*S*2] A distance vector protocol (with split horizon) avoids persistent routing loops, but not a link state protocol.
[*S*3] After a topology change, a link state protocol will converge faster than a distance vector protocol.

Which one of the following is correct about *S*1, *S*2 and *S*3? **[2014]**

(A) *S*1, *S*2 and *S*3 are all true
(B) *S*1, *S*2 and *S*3 are all false
(C) *S*1 and *S*2 are true, but *S*3 is false
(D) *S*1 and *S*3 are true, but *S*2 is false.

23. Let the size of congestion window of a TCP connection be 32 kB when a timeout occurs. The round trip time of the connection is 100 msec and the maximum segment size used is 2 kB. The time taken (in msec) by the TCP connection to get back to 32 kB congestion window is ______. **[2014]**

24. Which one of the following is TRUE about the interior gateway routing protocols-Routing information protocol (RIP) and Open Shortest Path First (OSPF)? **[2014]**

(A) RIP uses distance vector routing and OSPF uses link state routing
(B) OSPF uses distance vector routing and RIP uses link state routing
(C) Both RIP and OSPF use link state routing
(D) Both RIP and OSPF use distance vector routing

25. Consider the store and forward packet switched network given below. Assume that the bandwidth of each link is 10^6 bytes/sec. A user on host A sends a file of size 10^3 bytes to host B through routers R_1 and R_2 in three different ways. In the first case a single packet containing the complete file is transmitted from A to B. In the second case, the file is spilt into 10 equal parts, and these packets are transmitted from A to B. In the third case, the file is spilt into 20 equal parts, and these packets are sent from A to B. Each packet contains 100 bytes of header information along with the user data. Consider only transmission time and ignore processing, queuing and propagation delays. Also assume that there are no errors during transmissions. Let T_1, T_2 and T_3 be the times taken to transmit the file in the first, second and third case respectively. Which one of the following is CORRECT? **[2014]**

(A) $T_1 < T_2 < T_3$ (B) $T_1 > T_2 > T_3$
(C) $T_2 = T_3$, $T_3 < T_1$ (D) $T_1 = T_3$, $T_3 > T_2$

26. An IP machine Q has a path to another IP machine H via three IP routers R_1, R_2, and R_3.
$Q - R_1 - R_2 - R_3 - H$
H acts as an HTTP server, and Q connects to H via HTTP and downloads a file. Session layer encryption is used with DES as the shared key encryption protocol. Consider the following four pieces of information.
[*I*1] The URL of the file downloaded by Q
[*I*2] The TCP port numbers at Q and H
[*I*3] The IP addresses of Q and H
[*II*4] The link layer addresses of Q and H
Which of *I*1, *I*2, *I*3 and *I*4 can an intruder learn through sniffing at R_2 alone? **[2014]**
(A) Only *I*1 and *I*2 (B) Only *I*1
(C) Only *I*2 and *I*3 (D) Only *I*3 and *I*4

27. An IP router with a Maximum Transmission Unit (MTU) of 1500 bytes has received an IP packet of size 4404 bytes with an IP header of length 20 bytes. The values of the relevant fields in the header of the third IP fragment generated by the router for this packet are **[2014]**
(A) MF bit : 0, Datagram Length: 1444; Offset: 370
(B) MF bit: 1, Datagram Length : 1424; Offset: 185
(C) MF Bit: 1, Datagram Length: 1500; Offset: 370
(D) MF bit: 0, Datagram Length: 1424; Offset: 2960

28. Identify the correct order in which a server process must invoke the function calls accept, bind, listen, and recv according to UNIX socket API. **[2015]**
(A) listen, accept, bind, recv
(B) bind, listen, accept, recv
(C) bind, accept, listen, recv
(D) accept, listen, bind, recv

29. For a host machine that uses the token bucket algorithm for congestion control, the token bucket has a capacity of 1 megabyte and the maximum output rate is 20 megabytes per second. Token arrive at a rate to sustain output at a rate of 10 megabytes per second. The token bucket is currently full and the machine needs to send 12 megabytes of data. The minimum time required to transmit the data is _____ seconds. **[2016]**

30. Consider the following statements about the routing protocols. Routing Information Protocol (RIP) and Open Shortest Path First (OSPF) in an IPv4 network.
I: RIP uses distance vector routing
II: RIP packets are sent using UDP
III: OSPF packets are sent using TCP
IV: OSPF operation is based on link-state routing
Which of the statements above are CORRECT? **[2017]**
(A) I and IV only (B) I, II and III only
(C) I, II and IV only (D) II, III and IV only

Chapter 3

TCP/UDP

LEARNING OBJECTIVES

- *Transport layer*
- *User Diagram Protocol (UDP)*
- *TCP/IP*
- *TCP/IP vs OSI reference model*
- *TCP state transition diagram*
- *TCP flow control*
- *Application layer*
- *ICMP, SMTP, POP3, IMAP 4, HTTP, FTP*
- *DNS*
- *Network devices*

Transport Layer

Real communication takes place between two applications programs i.e., processes. For this, process-to-process delivery is needed. A mechanism is required in order to deliver data from one of these processes running on the source host to the corresponding process running on the destination host.

The transport layer is responsible for process-to-process delivery.

Addressing in Transport Layer

Port addresses

- A transport layer address is a port number.
- The destination port number is needed for delivery and the source port number is needed for reply.
- The port numbers are 16-bit integers ranging from 0 to 65535.

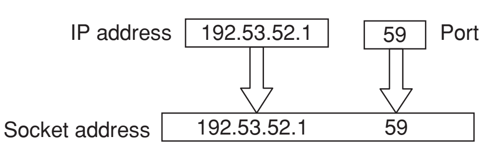
The IANA (Internet Assigned Number Authority) has divided the port numbers as:

- Well-known ports (0 to 1023)
- Registered ports (1024 to 49,151)
- Dynamic or private or ephemeral ports (49,152 to 65,535)

Socket address

Process to process delivery needs two identifiers, IP address and port address at each end to make a connection.

The combination of an IP address and a port number is socket address.



Protocols at transport layer

1. UDP
2. TCP
3. SCTP

User Datagram Protocol (UDP)

- UDP is connectionless protocol.
  - There is no mechanism for connection establishment or connection termination.
  - The packets may be delayed or lost or may arrive out of sequence, i.e., there is no acknowledgement.
  - Each user datagram sent by UDP is an independent program. Even if the user datagram's are coming from the same source program and going to the same destination process, there is no relationship between the different datagrams.

Thus, user datagrams can travel on a different path.

- Multicasting capability is embedded in UDP.
- It is a simple, unreliable transport protocol.
  - There is no flow control, no window mechanism.
  - There is no error control as well except for the checksum. The sender does not know if a message has been lost or duplicated. When the receiver detects an error through the checksum, the datagram is discarded silently.
- It is used in real-time applications.
  - The header length is fixed, of 8 bytes. Real time applications require a constant flow of data. Moreover, the unreliability (fast and less complex service) of UDP aids in real-time applications like voice over IP, online games etc.
- It encapsulates and decapsulates messages in an IP datagram.

User Datagram

UDP packets have other name called user datagrams. They have a fixed size header of 8 bytes. The datagram is divided into 4 fields.

Source port number (16-bits)	Destination port number (16-bits)
Total length (16-bits)	Checksum (16-bits)

Figure 1 User datagram header format

1. ***Source Port Number*** It is a 16-bit number used by the process running on the source host.
2. ***Destination Port Number*** It is also a 16 bit number used by the process running on the destination host.
3. ***Total length*** It is a 16-bit field, it defines the total length of the user datagram header and data. It can define a total length of 0 to 65535 bytes. A UDP packet is encapsulated in an IP packet.

UDP length = IP length – IP header's length

4. ***Checksum:*** It is optional field, if not available the field is filled with 1's. It is used to detect errors in user datagram (header plus data).

Protocols That Take UDP Services

Following are a few protocols that take the services of UDP:

1. Domain Name Service (port – 53): UDP is used to send small data. If the data is less than 512 bytes, then DNS uses UDP else it goes for TCP.
2. Trivial File Transfer Protocol (port – 69): TFTP is used to transfer simple and small files, it uses UDP service.
3. Routing Information protocol: It uses UDP service on port number 520 to update routers.
4. Simple Network Management Protocol (SNMP): The SNMP agent receives requests on UDP port 161 for management process.
5. Bootstrap protocol (BOOTP): For client (port 68) and for server (port – 67).

UDP Checksum Calculation

- The checksum includes a pseudo header, the UDP header and the data coming from the application layer.

32-bit source IP address		
32-bit destination IP address		
All 0's	8-bit protocol (17)	16-bit UDP total length

Figure 2 Pseudo header of UDP for checksum calculation

- The value of protocol field is 17. If this value is changed during transmission, the checksum calculation at the receiver will detect it and UDP drops the packet.
- If the checksum is not calculated, the field is filled with 0's. This means checksum calculation is optional.
- The calculated checksum can never be all 1's as this implies that the sum is all 0's. But this is impossible because for this the value of fields have to be 0's.

TCP/IP

TCP/IP is a network model which is used for the internet architecture, its main objectives are

- Connecting the multiple networks.
- Maintaining the intact connection between two machines, which are functioning.

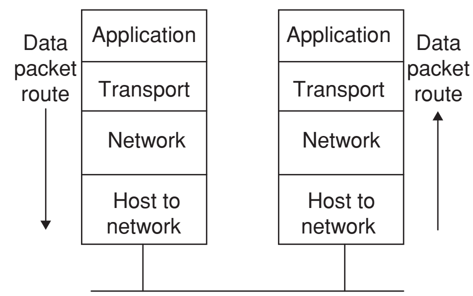


Figure 3 TCP/IP network protocol

TCP/IP vs OSI Reference Model

OSI	TCP/IP
(1) There are 7 layers	(1) There are 5 layers
(2) There is no definition for multicasting	(2) Multicasting is clearly defined
(3) Less flexibility	(3) Lot of flexibility
(4) Practically it is not suggestible as it is based on theoretical rules	(4) It is based on practical rules

- TCP stands for Transmission Control Protocol.
- It is connection-oriented protocol.
  - It creates a virtual connection between two TCPs to send data then data is transferred and at the end the connection is released.
  - There is acknowledgement mechanism for safe and sound arrival of data.
- It is a reliable transport protocol.
  - Uses flow and error control.
  - Slower and more complex service.
  - Duplicate segments are detected, lost segments are resent, the bytes are delivered to the end process in order.
- It is a stream-oriented protocol.

- Allows the sending process to deliver data as a stream of bytes and allows the receiving process to obtain data as a stream of bytes.
- TCP offers full-duplex service.
  - Data can flow in both directions at the same time.
  - Each TCP has a sending and receiving buffer.
  - It cannot be used in real time applications as the header length varies from 20-to-60 bytes, moreover it needs reliability.

TCP Header Format

- A packet in TCP is called a segment. The segment consists of a 20-to-60 bytes header.
- If there are no options, the header is of 20 bytes.

Source port address (16-bits)						Destination port address (16-bits)		
Sequence number (32-bits)								
Acknowledgement number (32-bits)								
HLEN (4-bits)	Reserved (6-bits)	URG	ACK	PSH	RST	SYN	FIN	Window size (16-bits)
Checksum (16-bits)					Urgent Pointer (16-bits)			
Options and Padding								

Figure 4 TCP header format

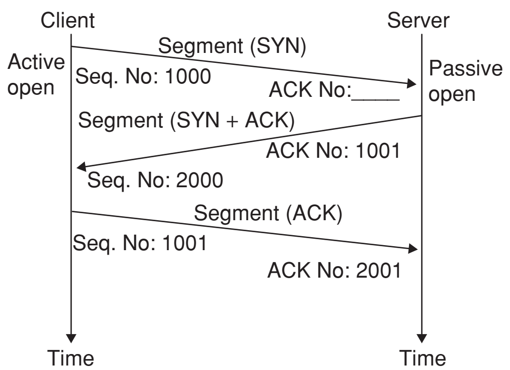
- If there are options, the header goes upto 60 bytes.
- ***Source Port addresses*** A 16-bit field that defines the port number of the application program in the host that is sending the segment.
- ***Destination Port address*** A 16-bit field that defines the port number of the application program in the host is receiving the segment.
- ***Sequence number*** A 32-bit field whose value defines the number of the first data byte contained in that segment. During connection establishment, a random number is generated to create an initial sequence number (ISN) which is usually different in each direction.
- ***Acknowledgement Number*** A 32-bit field whose value defines the number of the next byte, a party expects to receive. If the receiver of the segment has successfully received byte number x from the other party, it defines $x + 1$ as the acknowledgement number. The acknowledgement number is cumulative.
- ***HLEN(Header Length)*** This field is of 4-bit. The header length can be between 20 and 60 bytes. The value of this field can be between $5(5 \times 4 = 20)$ and $15(15 \times 4 = 60)$.
- ***Reserved*** This is a 6-bit field which is reserved for future use.
- ***Control*** This field contains 6 control flags. These are as follows.
  - URG: Urgent pointer. This flag is set when the value of urgent pointer field is valid.
  - ACK: Acknowledgement pointer. This flag is set when the value of acknowledgement field is valid. It is not set at the start of connection during 3-way handshake.
  - RST: Reset pointer. Used to reset the connection, reject an invalid segment or refuse an attempt to open a connection.
  - PSH: Push pointer. When a data is pushed the flag is set.
  - SYN: Synchronization pointer, used to synchronize sequence numbers during connection. If it is set to 1, then it is ISN. If set to 0, then it is the accumulated sequence number of the first data byte of the segment for the current session.
  - FIN: Finish Pointer. It is used to terminate a connection. It indicates that the sender is not interested in sending any more data.
- ***Window size*** The field size is of 16-bits and thus the maximum size of the window is 65,535 bytes. This field is determined by the receiver and thus referred to as the receiving window. The window size is variable.
- ***Checksum*** The inclusion of this 16-bits field is mandatory in TCP. The calculation of the checksum for TCP follows the same procedure as in UDP, only the value of protocol field in TCP is 6.
- ***Urgent pointer*** This 16-bit field, is valid only if the urgent flag is set. This field is used when the segment contains urgent data.
- ***Options and padding*** When the header length is greater than 5, option field is used to make the segment into the multiples of 32. Padding is used to ensure the ending of TCP header, it is composed to 32 zeros.

TCP Connection

- TCP is connection-oriented and the connection is virtual not physical.
- TCP operates at a higher level. TCP uses the services of IP to deliver individual segments to the receiver, but it controls the connection itself. Lost or corrupted segments are retransmitted.
- In TCP, connection-oriented transmission requires three phases:
  1. Connection establishment
  2. Data transfer
  3. Connection termination

Connection establishment

- The connection establishment in TCP is called three-way handshaking.
- The process starts with the server. The server program tells its TCP that it is ready to accept a connection. This is a request for a passive open.
- The client program issues a request for an active open. A client that wishes to connect to an open server tells its TCP that it needs to be connected to a particular server. Hence the TCP can start the three-way handshaking process as shown in the figure.



1. The first segment which is a SYN segment is identified by the randomly generated number and is assigned to a 1 byte dummy data indicating the sequence number.
2. Again from the server side a randomly generated number is assigned for the dummy data indicating the first byte.
3. A SYN segment cannot carry data, but it consumes one sequence number.

   A (SYN + ACK) segment cannot carry data, but consumes one sequence number.

   An ACK segment, if carrying no data, consumes no sequence number.
4. Initial Sequence Number (ISN) 1000 is sent from the client to server. Server receives the segment 1000 and is expecting segment 1001 as the next one.

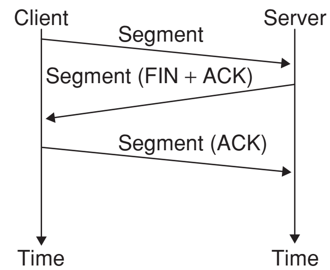
Data transfer

- After the connection is established, bidirectional data transfer can take place. Both the client and server can send data and acknowledgements.
- The data segments sent by the client have the PSH (push) flag set so that the server TCP knows to deliver data to the server process as soon as they are received.
- Sometimes the sending application program wants a piece of data to be read out of order by the receiving application program that means an application program needs to send urgent bytes then in this case the URG bit is set and the segment is send. The sending TCP creates a segment and inserts the urgent data at the beginning of the segment.

Connection termination

There are two options for connection termination.

Three-way handshaking

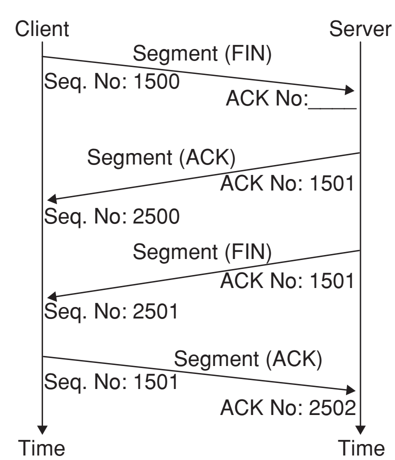


- The client process sends the first segment, a FIN segment in which the FIN flag is set. The FIN segment consumes one sequence number if it does not carry data.
- The server TCP sends the second segment, a FIN + ACK segment, to confirm the receipt of the FIN segment from the client and at the same time announce the closing of the connection in the other direction.

  The FIN + ACK segment consumes one sequence number if it does not carry data.
- The client sends the last ACK segment to the server. This segment contains acknowledgement number which is 1 plus, the sequence number received in the FIN segment from the server.

Four-way handshaking

- ***Half-close**:* In TCP, one end can stop sending data while still receiving data. This is half close.
- The client half-closes the connection by sending a FIN segment.
- The server accepts the half-close by sending the ACK segment. The data transfer from the client to the server stops.
- When the server has sent all the processed data, it sends a FIN segment, which is acknowledged by an ACK from the client.



TCP State Transition Diagram

The functionality of TCP connection setup, communication phase and termination phase can be easily depicted by the state transition diagram where the TCP will be only at one state at a time with respect to server or client.

A change in the state is only observed after receiving a request for change like ACK (acknowledgement).

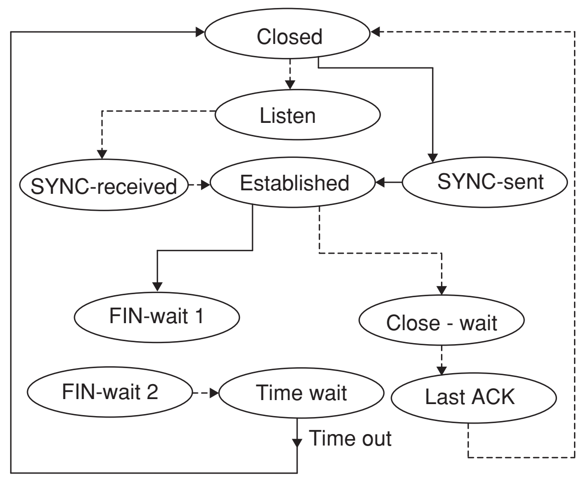


Figure 5 State transition diagram

Here, Solid line '–' is for client states, Break line '---' is for server states

State 'Closed' is common for both client and server. Initially the client and the server are in the closed state where no TCP connection is set. When an application request for a TCP connection then the client changes its state from closed to SYNC-sent state.

Client states

1. SYNC-sent — After the client sends a SYNC-sent and receives an ACK for the sent SYNC segment, it changes its state to ESTABLISHED STATE.
2. Established — In this state the client and the server exchange user data. After the requested application is completed, it sends a FIN segment and changes its state to FIN-wait 1.
3. FIN-wait 1 — FIN-wait 1 changes to FIN-wait 2 after receiving an ACK for sent FIN segment.
4. FIN-wait 2 — The client will remain in this state until it receives a FIN segment from the server. When the last ACK is sent by the client, the client changes its state to Time-wait.
5. Time-wait — A timer is set at this state for any delayed segment from the server which are removed or discarded at the client and after the timeout is reached, the client changes its state from present state to the closed state again.

Server states

1. Listen — This is a passive state where the server always listens for the SYNC request segment on different TCP ports.
2. SYN-received — After receiving the SYNC request from the client, the server acknowledges its state to the Established state.
3. Closed-wait — The server changes its state from Established to close-wait after receiving the finish segment from the client. In this state the server sends an ACK and finish segments. Afterwards it changes the state to last-ACK.
4. Last-ACK — In this state the server expects the last ACK segment from the client, as and when it receives the ACK segment it changes its state to again closed state.

TCP Congestion Control

- Deals with end-to-end delivery.
- Congestion handling in TCP is based on three phases:
  - Slow start
  - Congestion avoidance
  - Congestion detection

Slow start (exponential increase)

1. By default the receiver window size is initially set to 1.
2. In the first instance the transmitter receives an ACK for the window size indicating the receiver window size as 2 segments.
3. After 2 segments are sent it is acknowledged with 4 segments.
4. After 4 segments are sent it it acknowledged with 8 segments.
5. This is exponential growth and this growth continue until the window size reaches the threshold value.
6. If there is delayed ACKs, the increase in the size of the window is less than power of 2.

Congestion avoidance (additive increase)

1. To avoid the congestion before it happens, the exponential growth of slow start algorithm must be slowed down.
2. When the threshold is reached, then the additive phase begins. Here each time the whole window of segments is acknowledged, the size of congestion window is increased by 1.

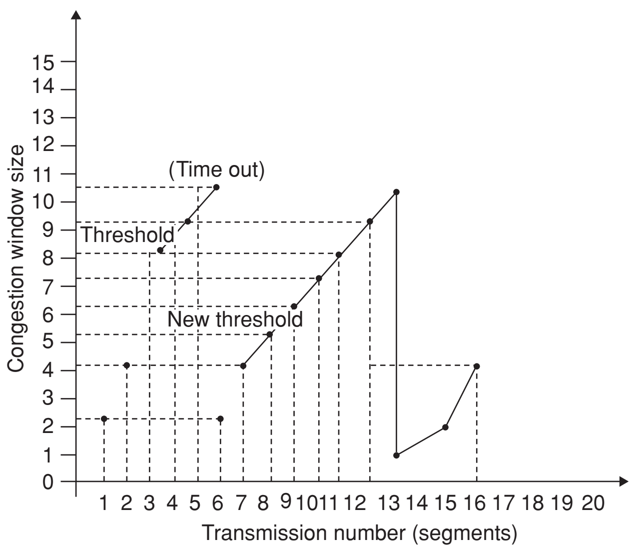
Congestion detection (multiplicative decrease)

1. If congestion occurs, the congestion window size must be decreased. The only way the sender can guess the congestion has occurred is by the need to retransmit a segment.
2. Retransmission can occur in two cases:
   (i) When a timer times out.
   (ii) When 3 ACKs are received.

3. In both the cases the size of threshold is dropped to one-half of the current window size and the window size is decreased to initial window size "1".
   This is multiplicative decrease.

Example: Let us take an example to explain the TCP congestion control.

Consider an instance of TCP additive increase, multiplicative decrease algorithm where the window size at the start of slow-start phase is 2 MSS (Maximum Segment Size) and threshold value is 8 MSS. The timeout occurs at the fifth transmission. Then what is the congestion window size at the end of the tenth transmission?



Window size is 2 MSS initially.

8 MSS is threshold value, after this there is only increase of 1-1 window size till timeout value which is 10.

The new threshold value becomes half of the value of current congestion window i.e., 5.

Timeout remains the same i.e., 10.

At 10th transmission the window size is 7.

After time-out, at 13th transmission window size = 1 and at 14th transmission window size = 2.

TCP Flow Control

- For flow control sliding window protocol is used.
- The window size is set by the receiver and is controlled by the receiver. The window size is not fixed (variable).
- The sliding window protocol in TCP looks like the Go-Back-N protocol because it does not use NAKs; it looks like Selective Repeat because the receiver holds the out-of-order segments until the missing ones arrive.
- A sliding window is used to make transmission more efficient as well as to control the flow of data so that the destination does not become overwhelmed with data. TCP sliding windows are byte-oriented.

TCP Error Control

- TCP provides reliability using error control.
- Error control includes mechanism for detecting corrupted segments, lost segments, out-of-order segments and duplicated segments.
- Error detection and correction in TCP is achieved through the use of three tools:
  - Checksum
  - Acknowledgment
  - Time-out

Checksum

Each segment includes a checksum field which is used to check for a corrupted segment. A 16-bit checksum is mandatory in every segment.

Acknowledgement

- There is no negative ACK in TCP.
- There is no ACK for the received ACK.
- Only the correctly received segments are acknowledged, if any segment if found to be corrupted through checksum such segments are not acknowledged.

Time-out

Different timers are deployed for error control.

1. ***Time-awaited timer:*** This timer is used to handle TCP termination process specially to handle duplicate finish segments.
   Its value is set to twice the life time of a segment.
2. ***Keep-Alive Timer:*** This timer is used to handle long idle TCP connections.
   By default its value is 2 hours, beyond which a probe (1 byte dummy data) is used for 10 consecutive times with a separation of 75 milliseconds. If there is no response beyond this, then the connection is terminated.
3. ***Persistence Timer:*** This timer is used to handle Zero(0) window size scenario.
   The sender sends 1 probe every 60 seconds until it receives a non-zero window size from where the communication resumes.
4. ***Retransmission Timer:*** This timer is used for handling any lost segments. Its value is twice the Round trip time, i.e., $2 \times$ RTT.
   RTT is time needed for a segment to reach a destination and for an acknowledgement to be received.

APPLICATION LAYER

An interface between the networks is called application. This section introduces two important concepts:

- Application Layer: The application layer of the OSI model provides the first step of getting data onto the network.

- Application Software: Applications are the software programs used by people to communicate over the network. Examples of application software, includes HTTP, FTP, e-mail, and others, used to explain the differences between these two concepts.

In the OSI model, information is passed from one layer to the next, starting at the application layer on the transmitting host and proceeding down the hierarchy to the physical layer, then passing over the communications channel to the destination host, where the information proceeds back up the hierarchy, ending at the application layer.

The following six steps explain the procedure:

1. People create the communication.
2. The application layer prepares human communication for transmission over the data network.
3. Software and hardware converts communication to digital format.
4. Application layer services initiate the data transfer.
5. Each layer plays its role. The OSI layers encapsulate data down the stack. Encapsulated data travels across the media to the destination. OSI layers at the destination unencapsulate the data.
6. The application layer receives data from the network and prepares it for human use.

The application layer, layer 7, is the top layer of both the OSI and TCP/IP models. Layer 7 provides the interface between the application you use to communicate and the underlying network over which your messages are transmitted. Application layer protocols are used to exchange data between programs, running on the source and destination hosts.

TCP/IP Application Layer Protocol

The most widely known TCP/IP application layer protocols are those that provide the exchange of user information. These protocols specify the format and control information necessary for many of the common internet communication functions. Among these, TCP/IP protocols are the following.

- Domain name system (DNS) is used to resolve internet names to IP addresses.
- Hypertext transfer protocol (HTTP) is used to transfer files that make up the web pages of the world wide web.
- Simple mail transfer protocol (SMTP) is used for the transfer of mail messages and attachments.
- Telnet, a terminal emulation protocol, is used to provide remote access to servers and networking devices.
- File transfer protocol (FTP) is used for interactive file transfers between systems.

Application Layer Services

Programs such as file transfer or network print spooling, might need the assistance of application layer services to use network resources. Although transparent to the user, these services have interface with the network and prepares the data for transfer. Different types of data whether it is text, graphics or video require different network services to ensure that it is properly prepared for processing by the functions occurring at the lower layers of OSI model. Application layer services establish an interface to the network and protocols provide the rules and formats that govern how data is treated, a single executable program can use all three components. For example, while discussing "Telnet", you could be referring to the Telnet application, the Telnet service, or the Telnet protocol.

Application Layer Protocol Functions

Both the source and destination devices use application layer protocols during a communication session. For the communications to be successful, the application layer protocols implemented on the source and destination host must match.

Protocols perform the following tasks

- Establish consistent rules for exchanging data between applications and services loaded on the participating devices.
- Specifies how data inside the messages is structured and the types of messages that are sent between source and destination. These messages can be requests for services, acknowledgements, data messages, status messages, or error messages.
- Defines message dialogues, ensuring that a message being sent is met by the expected response and that the correct services are invoked when data transfer occurs.

Applications and services can also use multiple protocols in the course of a single conversation. One protocol might specify how to establish the network connection and another might describe the process for the data transfer when the message is passed to the next lower layer.

A single application can employ many different supporting application layer services. Thus, what appears to the user as one request for a web page might, in fact, amount to dozens of individual requests. For each request, multiple processes can be executed. For example, the FTP requires a client to initiate a control process and a data stream process to a server. Additionally, servers typically have multiple clients requesting information at the same time, as shown in the figure below. For example, a Telnet server can have many clients requesting connections to it. These individual client requests must be handled simultaneously and separately for the network to succeed. The application layer processes and services rely on support from lower layer functions to successfully manage the multiple conversations.

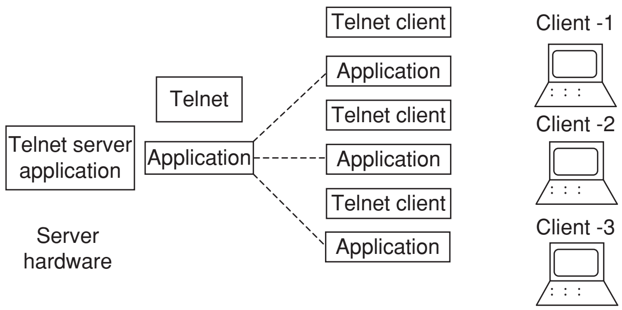


Figure 6 Multiple client's service Requests

Application Layer Protocols

The transport Layer uses an addressing scheme called a port number. Port numbers identify application layer services that are source and destination of data. Server programs generally use predefined port numbers that are commonly known by clients.

Some of these services are

- Domain Name System (DNS): TCP/UDP Port 53
- HTTP: TCP Port 80
- Simple Mail Transfer Protocol (SMTP): TCP Port 25
- Post office Protocol (POP): UDP Port 110
- Telnet: TCP Port 23
- DHCP: UDP Port 67
- FTP: TCP Ports 20 and 21

Internet Control Message Protocol (ICMP)

- Used by hosts and gateways to send notification of datagram problems back to the sender.
- Used for error reporting and query messages.
- Helpful in network debugging.
- Uses the services of TCP and UDP with the port number 7 as the ping command which is used for testing, this testing is done from a source which starts at the application layer and reaches network through transport layer.
- ICMP is encapsulated into an IP datagram and then transmitted into the network, if the protocol filed in the IP datagram is 1 then the IP datagram is said to be carrying ICMP message.

Types of messages

Error reporting

- **Destination Unreachable:** The packet is discarded due to the host not present in the network or the host is not responding to the request.
- **Source Quench:** The packet is discarded due to the congestion in the network.
- **Parameter Problem:** The packet is discarded due to the processing problem observing a change in the header format of the I/P datagram.
- **Time Exceeded:** The packet is discarded because the TTL value is decremented to zero(0).
- Redirection: Here the packet is not discarded but redirected to a network as the host doesn't belong to this network.

Query message

Router solicitation and router advertisement request and reply: Router solicitation is a request generated by the source requesting the router's presence in the network.

The response is a router advertisement generated by the router broadcasting its network id and its presence in the network.

Address mask request and reply: If by any means the node is unable to identify the network bits in its I/P address then this request is used by the source to a router requesting for the network id, the reply is also unicast in this scenario.

Time stamp echo request and reply: This is used to calculate the round trip time of a packet for network diagnose or debugging.

Echo request and reply: This is used to see the presence of a host or a router in the network. For example PING.

SMTP

- SMTP stands for simple mail transfer protocol.
- It uses the services of TCP on port number 25.
- It is a push protocol. Even when the destination is not interested to receive the message this push approach of the SMTP makes the receiver receive the message.
- Components of SMTP:

1. User Agent (UA) :
   (i) It provides Graphical User Interface access to the user.
   Example: Netscape navigation, Mozilla Firefox.
   It also provides command-driven access in early days.
   (ii) It handles the inbox transactions:
   (a) Composing messages: Helps the user compose the e-mail message to be sent out.
   (b) Reading messages: Helps to read incoming messages by checking the mail in the incoming mail box.
   (c) Replying to messages: Sends the message to the sender or recipients of the copy.
   (d) Forwarding messages: Sends the message to a third party.
   (e) Handling mailboxes: Two mailboxes, an inbox and an outbox are created by the user agent. The inbox keeps all the received e-mails until they are deleted by the user. The outbox keeps all the sent e-mails until the user deletes them.

2. Mail transfer agent (MTA): The actual mail is transferred using MTA.
3. Multipurpose Internet mail extension (MIME): By default SMTP uses ASCII format for transaction. But few languages like Japanese, German etc do not support ASCII format. Hence for carrying non-ASCII form of transactions MIME is used in congestion with SMTP. Thus, MIME is a set of software functions that transforms non-ASCII data (stream of bits) to ASCII data and vice-versa.
4. Mail access protocol (MAP): MAP is a pull approach where the emails of a client are retrieved from the mail server i.e., it is used to retrieve the clients emails from the mail server.

   Two protocol of MAP are

   (i) POP 3 (Post Office Protocol)

   (ii) IMAP4 (Internet MAP)

POP3

1. It is a pull protocol.
2. It uses the services of TCP on port number 110.
3. POP3 has several drawbacks and hence it is currently not in use.
   - A user cannot have different folders on the server.
   - A user cannot partially check the contents of the mail before downloading.
   - A user cannot search a mail with a keyword.
   - The user is not allowed to organize the mail on the server.

(4) Modes of POP3

   (i) Copy mode: The mails are copied from the mail server onto the client.

   (ii) Delete mode: The mails are transferred from the mail server to the client and deleted at the mail server. By default POP3 uses delete mode.

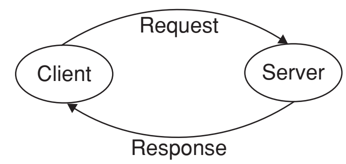
IMAP 4

To overcome the drawbacks of POP3, IMAP4 is in current use. It provides the following functions:

1. A user can create, delete or rename mail boxes on the mail server.
2. A user can create a hierarchy of mailboxes in a folder.
3. A user can partially download e-mail.
4. A user can check the e-mail header before downloading and can search the contents of the e-mail for any specific character prior to downloading.

HTTP

- HTTP stands for Hyper Text Transfer Protocol.
- It uses the services of TCP on well known port 80.
- It is a protocol mainly used to access data on the World Wide Web (www).
- HTTP functions as a combination of FTP and SMTP.
- It uses only one TCP connection, there is no separate control connection, only data is transferred between the client and the server.
- HTTP messages are read and interpreted by the HTTP server and HTTP client (browser).
- It works on two commands request and reply.
- It is a stateless protocol as it does not have any mapping from one transaction onto the other and treats a request and reply as a pair every time.



HTTP1.1 has several request types called methods:

1. GET: Requests a document from the server.
2. HEAD: Requests information about a document but not the document itself.
3. POST: Sends some information from the client to the server.
4. PUT: Sends a document from the server to the client.
5. TRACE: Echoes the incoming request.
6. CONNECT: Reserved.
7. OPTION: Inquires about available options.

- HTTP supports proxy servers. A proxy server is a computer that keeps copies of responses to recent requests. This reduces the load on the original server, decreases traffic and improves latency.
- HTTP Connections:

  (i) *Non-persistence:* In this connection approach for every request and reply (response) as a pair, a separate TCP connection is established every time. It suffers from slow start process. This was present in http version 1.0. Two RTTS are required to fetch each object.

  (ii) *Persistence:* Here a single TCP connection is set on which multiple request and response can be made. This is observed from http version 2.0 onwards (apache http server). For http/1.1 is default. Hence we have reduced network congestion and faster content delivery.

File Transfer Protocol (FTP)

- FTP uses the services of TCP.
- It needs two TCP connections:
  - Uses well-known port 21 for the control connection.
  - Uses well-known port 20 for the data connection.

- Mode of access:

  FTP(TCP) – requires username and password.
  TFTP(UDP) – requires no username and password.
- Types of files supported by FTP:

  i. ASCII: By default FTP follows ASCII mode for file transfer. It is composed of 7-bit + 1 parity bit.
  ii. EBCDIC: If any node supports EBCDIC then this type of technique is used for file transfer. BCDIC supports 8 bits data format and is used in IBM. There is no error control i.e., there is no parity bit.
  iii. Image file: If the file to be sent is very large then continuous streams of 0s and 1s are sent to the transport layer. This is image file. Here FTP does not care of code, it is done by the lower layers.

- **Transmission mode of FTP:** FTP can transfer a file across the data connection by using one of the following three transmission modes:

  i. Stream mode: This is the default mode. Data are delivered from FTP to TCP as a continuous stream of bytes.
  ii. Block mode: Data is delivered from FTP to TCP in blocks. Each block is preceded by a 3-byte header. The first byte is called the block descriptor, the next two bytes define the size of the block in bytes.
  iii. Compressed mode: If the file is big then the data is compressed. The compression method which is mostly used is run-length encoding. Consecutive appearances of a data unit are replaced by one occurrence and the number of repetitions. In a binary file, null characters are compressed.

DNS

- Stands for Domain Name System.
- The DNS is a client/server application that identifies each host on the Internet with a unique user-friendly name i.e., it is used to map an Uniform Resource Locator (URL) to an IP address.
- DNS can use the services of UDP or TCP using the well-known port 53.
- If the size of the response message is more than 512 bytes, it uses the TCP connection.
- When the size of the response message is less than 512 bytes, UDP connection is used. Even though the size of message is not known then also UDP can be used. The UDP server will truncate the message if the message size is more than 512 bytes.
- DNS organizes the namespace in a hierarchical structure to decentralize the responsibilities involved in naming.
- DNS can be pictured as an inverted hierarchical tree structure with one root node at the top and a maximum of 128 levels. Each node in the tree has a domain name.

For example, on the Internet, the domain names, such as http//www. cisco.com, are much easier for people to remember than 198.132.219.25. Also if, cisco decides to change the numeric address, it is transparent to the user, because the domain name will remain http//www.cisco.com. The new address will simply linked to the existing domain name and connectivity is maintained as shown in the figure.

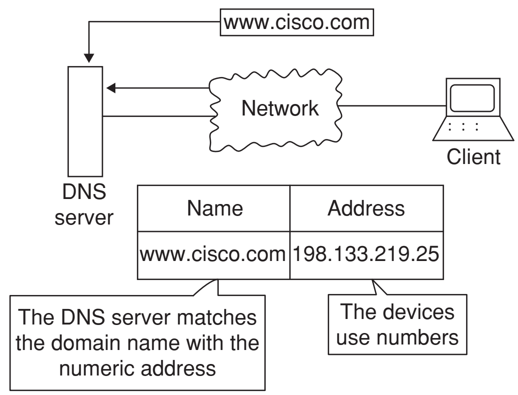


Figure 7 DNS addresses

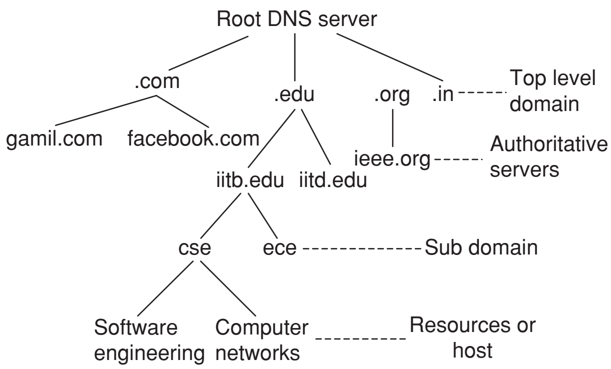
When networks were small, it was a simple task to maintain the mapping between domain names and the addresses they represent. However, as networks began to grow and the number of devices increased, this manual system became unworkable. DNS was created for domain name to address resolution for these networks. DNS uses a distributed set of servers to resolve the names associated with these numbered addresses.

The DNS protocol defines an automated service that matches resource names with the required numeric network address. It includes the format for queries, responses, and data formats. DNS protocol communications use a single format called a message. This message format is used for all types of client queries and server responses, error messages, and the transfer of resource record information between servers. DNS is a client/server service, however, it differs from the other client/server services. Where as other services use a client that is an application (Web browser, e – mail, client, and so on) the DNS client runs as a service itself. The DNS client, sometimes called the DNS resolver, supports name resolution for the other network applications and other services that need it.

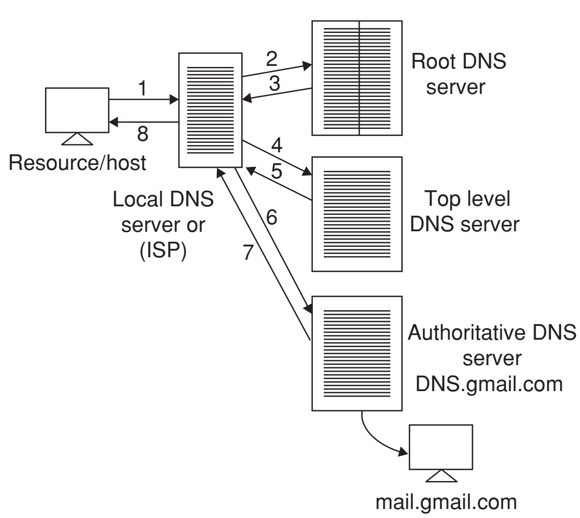
When configuring a network device, you generally provide one or more DNS server addresses that the DNS client can use for name resolution. Usually the Internet Service Provider (ISP) gives you the address to use for the DNS servers. When a user's application requests to connect to a remote device by name, the requesting DNS client queries one of these DNS servers to resolve the name to a numeric address.

- The domain name space consists of a tree of domain names. Each node or leaf in the tree has zero or more resource records, which holds information associated with the domain name. The tree sub-divides into zones beginning at the root zone. A DNS zone consists of a collection of connected nodes authoritatively served by an authoritative name server.



Components of DNS

1. Root DNS Server : Root name servers keep track of all the authoritative name servers of each of the top level domain (TLD) name servers.
2. Top Level Domain: It provides the information regarding the presence of different zone files like
   (i) based on geographical location (country domain): us—for United Statesm, in—for India
   (ii) based on general attributes (generic domain): com—used by commercial organization
   Example, gmail.com
   .edu—used by educational institutes
   .org—used by non-profit organizations
   Example, ieee.org
   .gov—used by government institutions
   Example, nasa.gov
   .mil—used by military organizations
   Example, army.mil
3. Zones: The TLD and the domains under TLD are divided into smaller units with the help of delegation. The domain is divided into small units, so that it can be managed easily. These small units are zones.
4. Authoritative DNS servers checks whether authoritative name servers are located in the DNS hierarchy.



Dns Resource Records (RR)

- Every domain, whether it is a TLD, subdomain or single host have a set of resource records associated with it in the DNS distributed data base.
- Resource Records provide the mapping of host name to IP address. When a query is made to the DNS server, the host or server. who sends that query receives a response which is nothing but the resource record associated with it.
- A Resource Record (RR) is a 5 tuple that contains (Name, Time to live, class, Type, Value)
  (i) Name: It is the domain name to which this RR belongs to. More than one resource records may exists for the same domain.
  (ii) Time to live: The TTL is measured in seconds and it is a 32-bit integer.
  (iii) Class: This field contains the value 'IN' which tells whether this record is used by internet or not.
  (iv) Type: Defines type of RR address, name service, canonical name.
  (v) Value: This field can be a number, ASCII strings or any domain.

Networking Devices

Repeater

In digital communication systems, a repeater is a device that receives a digital signal on an electromagnetic or optical transmission medium and regenerates the signal. Repeaters remove the unwanted noise in an incoming signal. Unlike an analog signal, the original digital signal, even if weak or distorted, can be clearly perceived and restored. With analog transmission, signals are re strengthened with *amplifiers* which unfortunately also amplify noise as well as information.

Hub

A hub is the central part of a wheel where the spokes come together. The term is familiar to frequent fliers who travel through airport "hubs" to make connecting flights from one point to another. In data communications, a hub is a place of convergence where data arrives from one or more directions and is forwarded out in one or more other directions. A hub usually includes a switch of some kind. (And a product that is called a "switch" could usually be considered a hub as well.)

Switch

In a telecommunications network, a switch is a device that channels incoming data from any of multiple input ports to the specific output port that will take the data towards its intended destination. In the traditional circuit-switched telephone network, one or more switches are used to set up a dedicated though temporary connection or circuit for an exchange between two or more parties.

In the open systems Interconnection (OSI) communications model, a switch performs the Layer 2 or Data-link layer

function. That is, it simply looks at each packet or data unit and determines from a physical address (the "MAC address") which device a data unit is intended for and switches it out towards that device. However, in wide area networks such as the Internet, the destination address requires a look-up in a routing table by a device known as a router. Some newer switches also perform routing functions (Layer 3 or the Network layer functions in OSI) and are sometimes called IP switches. On larger networks, the trip from one switch point to another in the network is called a hop. The time a switch takes to figure out where to forward a data unit is called its latency. The price paid for having the flexibility that switches provide in a network is this latency. In the simplest networks, a switch is not required for messages that are sent and received within the network. For example, a local area network may be organized in a token ring or bus arrangement in which each possible destination inspects each message and reads any message with its address.

Bridge

A bridge is a product that connects a local area network (LAN) to another local area network that uses the same protocol (for example, Ethernet or token ring). You can envision a bridge as being a device that decides whether a message from you to someone else is going to the local area network in your building or to someone on the local area network in the building across the street. A bridge examines each message on a LAN, passing those to be within the same LAN and forwarding those known to be on the other interconnected LAN (or LANs).

In bridging networks, computer or node addresses have no specific relationship to location. For this reason, messages are sent out to every address on the network and accepted only by the intended destination node. Bridges learn which addresses are on which network and develops a *learning table* so that subsequent messages can be forwarded to the right network.

Bridging networks are generally always interconnected local area networks since broadcasting every message to all possible destinations would flood a larger network with unnecessary traffic. For this reason, router networks such as the Internet uses a scheme that assigns addresses to nodes so that a message or packet can be forwarded only in one general direction rather than forwarded in all directions. A bridge works at the data-link (physical network) level of a network, copying a data frame from one network to the next network along the communications path. A bridge is sometimes combined with a router in a product called a brouter.

Routers

Routers operate on the Network layer, which is a higher level in the OSI conceptual model. Routers use a combination of software and hardware, but it is used to route data from its source to its destination. Routers actually have a sophisticated OS that allows them to configure various connection ports. You can setup a router to route data packets from different network protocol stacks, which include TCP/IP, IPX/SPX and AppleTalk.

Routers are also used to connect remote LANs together using different WAN technologies. But, when a router has become large, the large network is divided into logical segments called subnets. This division of the network is based on the addressing scheme related to a particular subnet is kept local. The router only forwards data that is meant for the subnets on the extended network.

Routers also help to decide how to forward data packets to their destination based on the routing table. The protocols built into the router's operating system is used to identify neighboring routers and their network addresses. This allows routers to build a routing table.

Brouter

A brouter is a network bridge and a router combined in a single product. A bridge is a device that connects one local area network (LAN) to another local area network that uses the same protocol (for example, Ethernet or token ring). If a data unit on one LAN is intended for a destination on an interconnected LAN, the bridge forwards the data unit to that LAN; otherwise, it passes it along the same LAN. A bridge usually offers only one path to a given interconnected LAN. A router connects a network to one or more other networks that are usually part of a wide area network and may offer a number of paths out to destinations on those networks. A router therefore needs to have more information than a bridge about the interconnected networks. It consults a routing table for this information. Since a given outgoing data unit from a computer may be intended for an address on the local network, on an interconnected LAN, or the wide area network, it makes sense to have a single unit that examines all data units and forwards them appropriately.

Gateway

A gateway is a network point that acts as an entrance to another network. On the Internet, a node or stopping point can be either a gateway node or a host (end-point) node.

In the network for an enterprise, a computer server acting as a gateway node is often also acting as a proxy server and a firewall server. A gateway is often associated with a router, which knows where to direct a given packet of data that arrives at the gateway, and a switch, which furnishes the actual path in and out of the gateway for a given packet.

Exercises

Practice Problems 1

Directions for questions 1 to 15: Select the correct alternative from the given choices.

1. If TCP RTT is currently 40 m/sec and the following acknowledgements come in after 26, 32 and 24 m/sec respectively. What is the new RTT estimate? $\alpha = 0.9$.
   (A) 32.69 (B) 24.31 (C) 36.55 (D) 42.23
2. If a TCP connection is transferring a file of 5000 bytes. The first byte is numbered 1001. What are the sequence numbers for each segment if data is sent in five segments, each carrying 1000 bytes?
   (A) 1001, 2001, 3001, 4001, 5001
   (B) 1000, 2000, 3000, 4000, 5000
   (C) 5000, 6000, 7000, 8000, 9000
   (D) 5001, 6001, 7001, 8001, 9001
3. Which of the below statements hold good with respect to routing done by a bridge?
   (i) they can route packets using IP addresses
   (ii) they use data link layer addresses to do routing
   (iii) the LAN route IPv4,IPv6,Apple Talk, ATM, OSI packets
   (A) (i), (ii) (B) (ii), (iii)
   (C) (i), (iii) (D) (i), (ii), (iii)
4. Match the following:

i	Repeaters	p	connects different nodes of a LAN
ii	Hub	q	amplifies the signal between segments
iii	Switch	r	connects different LANs
iv	Bridge		

   (A) i – q ii – r iii – p iv – r
   (B) i – r ii – p iii – q iv – q
   (C) i – q ii – p iii – p iv – r
   (D) i – p ii – p iii – q iv – r
5. Match the following.

i	Retransmission timer	p	goes off when a TCP connection is idle for a long time
ii	Keep-alive timer	q	goes off if sender and receiver are waiting for each other
iii	Persistence timer	r	goes off to trigger the delivery of a segment in case acknowledgement is not received for first attempt

   (A) i – r ii – q iii – p
   (B) i – q ii – r iii – p
   (C) i – p ii – r iii – q
   (D) i – p ii – q iii – r
6. In T/TCP (Transactional TCP) what does the packet that is sent by client, consist of?
   (i) SYN (ii) REQUEST (iii) FIN
   (A) (i), (ii) (B) (ii), (iii)
   (C) (i), (iii) (D) (i), (ii), (iii)
7. Assume TCP uses 32-bit sequence numbers and sequence numbers are given to each byte that gets transmitted. If data is transmitted at 1 Gbps. What is the wraparound time for sequence numbers?
   (A) 14.4 sec (B) 24.24 sec
   (C) 34.36 sec (D) 44.45 sec
8. What are the disadvantages of NAT?
   (i) NAT forms link between sender and receiver and then link can be broken irreparably during a connection.
   (ii) NAT violates architectural model of IP.
   (iii) NAT hacks source port field of TCP header which is of limited size.
   (iv) NAT alleviates IP shortage.
   (A) (i), (ii), (iii) (B) (ii), (iii), (iv)
   (C) (i), (iii), (iv) (D) (i), (ii), (iv)
9. What is the main protocol in the transport layer?
   (A) TCP (B) UDP
   (C) FTP (D) Both (A) and (B)
10. Number of bytes for header in UDP segment and TCP segment are
    (A) 8 bytes, 20 bytes (B) 16 bytes, 16 bytes
    (C) 32-bits, 20-bits (D) None of these
11. TCP maintains a variable RTT (Round trip time), for determining the time to reach destination and receiving acknowledgement, the formula for RTT is
    (A) RTT = RTT + D
    (B) RTT = 4RTT
    (C) RTT = αRTT + $(1 - \alpha)$ M ($\alpha = 7/8$)
    (D) None of these.
12. Maximum segment size is
    (A) The size of the segment without header.
    (B) The size of the segment with limit.
    (C) The transmission link capacity.
    (D) Less than maximum transfer unit.
13. What is meant by silly window syndrome that ruins TCP performance?
    (A) This occurs when sender sends data in large blocks and receiver receives in large blocks.
    (B) This occurs when sender sends data in large blocks and receiver receives in or reads one byte at a time.
    (C) Both (A) and (B)
    (D) None of these

Common data for questions 14 and 15: A TCP segment begins with a fixed-format, 20-byte header. The header is followed by reader options. After the options, upto 65,495 bytes of data may follow.

14. Number of one bit flags available in the TCP header are
    (A) 5 (B) 6
    (C) 2 (D) None of these
15. Which of the flags is used for establishing connections?
    (A) PSH (B) ACK (C) URG (D) SYN

Practice Problems 2

Directions for questions 1 to 15: Select the correct alternative from the given choices.

1. Which of the below TCP primitives block a port?
   (i) LISTEN (ii) CONNECT (iii) RECEIVE
   (A) (i), (ii) (B) (ii), (iii)
   (C) (i), (iii) (D) (i), (ii), (iii)
2. In the context of TCP sockets how is a symmetric DISCONNECT different from that of an asymmetric one?
   (i) In symmetric DISCONNECT each direction is closed separately.
   (ii) In asymmetric DISCONNECT each direction is closed separately.
   (iii) In asymmetric DISCONNECT transport user can release the connection
   (A) (i), (ii) (B) (ii), (iii)
   (C) (i), (iii) (D) (i), (ii), (iii)
3. When does RPC/UDP does not make a good combination?
   (i) When the caller and callee machines are separated by small network distance.
   (ii) When the parameters of the procedures are too huge in size.
   (iii) When the procedure requested cannot be repeated safely as needed.
   (A) (i), (ii) (B) (ii), (iii)
   (C) (i), (iii) (D) (i), (ii), (iii)
4. Which of the following statements below are true with reference to RTP (Real Time Transport Protocol)?
   (i) It multiplexes server real time data stream into a single stream of UDP packets.
   (ii) RTP has flow control, error control mechanism.
   (iii) RTP has no mechanism for retransmission.
   (A) (i), (ii) (B) (ii), (iii)
   (C) (i), (iii) (D) (i), (ii), (iii)
5. What does RTCP (real time transport control protocol) accomplish?
   (i) Provides feedback on delay, jitter etc to sources.
   (ii) Handles introstream synchronization.
   (iii) Provides a way to name the sources.
   (A) (i), (ii) (B) (ii), (iii)
   (C) (i), (iii) (D) (i), (ii), (iii)
6. Which of the following are applicable to TCP?
   (i) Breaks the data coming from upper layers into 64 kbyte size packets and transmits them.
   (ii) Manages the time out and re-uses them.
   (iii) Should reassemble the packets in correct order at receiving end.
   (iv) TCP supports multicasting.
   (A) (i), (ii), (iii) (B) (ii), (iii), (iv)
   (C) (i), (iii), (iv) (D) (i), (ii), (iv)
7. Which of the below statements about sockets is/are true?
   (i) For sender and receiver to avail TCP service sockets have to be created.
   (ii) Each socket is a 16 bit number local to that host.
   (iii) Sockets can involve themselves in one connection at a time.
   (iv) Ports below 1024 are reserved.
   (A) (i), (ii), (iii) (B) (ii), (iii), (iv)
   (C) (iii), (iv), (i) (D) (i), (ii), (iv)
8. What are the functions of application layer?
   (A) Mail service provides a basis for electronic mails forwarding and storage
   (B) File access transfer and management
   (C) Creates virtual terminal that allows us to log onto remote host
   (D) All the above
9. Which of the following application uses UDP?
   (A) Streaming a multimedia
   (B) Client–server interaction
   (C) Internet telephony
   (D) All the above
10. What are the reasons for choosing an UDP by an application?
    (A) No connection establishment
    (B) No connection state
    (C) Small packet header
    (D) All the above
11. TCP uses multiple timers to do its work, the timers are
    (A) Retransmission timer
    (B) Persistence timer
    (C) Keep alive timer
    (D) All the above
12. Which of the following is supported by TCP connections?
    (A) Full-duplex (B) Point-to-point
    (C) Multicasting (D) Both (A) and (B)
13. TCP connection is ________ stream.
    (A) Byte (B) Message
    (C) Packet (D) None of these.
14. If a sender wants to indicate that, it has no data for the receiver, one of the following bits is set.
    (A) PSH (B) RST
    (C) FIN (D) ACK
15. If the receiver host is responding by sending a primitive SYN (SEQ = y, ACK = $x + 1$) means
    (A) The receiver data sequence number is y.
    (B) It has received up to $x + 1$ bytes of data.
    (C) Both (A) and (B)
    (D) None of these

Previous Years' Questions

1. The transport layer protocols used for real time multimedia, file transfer, DNS and email respectively are **[2013]**

(A) TCP, UDP, UDP and TCP
(B) UDP, TCP, TCP and UDP
(C) UDP, TCP, UDP and TCP
(D) TCP, UDP, TCP and UDP

2. Which one of the following socket API functions converts an unconnected active TCP socket into a passive socket? **[2014]**

(A) Connect (B) Bind
(C) Listen (D) Accept

3. Suppose two hosts use a TCP connection to transfer a large file. Which of the following statements is/are FALSE with respect to the TCP connection? **[2015]**

I. If the sequence number of a segment is m, then the sequence number of the sub sequent segment is always $m + 1$.
II. If the estimated round trip time at any given point of time is t sec, the value of the retransmission timeout is always set to greater than or equal to t sec.
III. The size of the advertised window never changes during the course of the TCP connection.
IV. The number of unacknowledged bytes at the sender is always less than or equal to the advertised window.

(A) III only (B) I and III only
(C) I and IV only (D) II and IV only

4. In one of the pairs of protocols given below, both the protocols can use multiple TCP connections between the same client and the server. Which one is that? **[2015]**

(A) HTTP, FTP (B) HTTP, TELNET
(C) FTP, SMTP (D) HTTP, SMTP

5. Assume that the bandwidth for a TCP connection is 1048560 bits/sec. Let α be the value of RTT in milliseconds (rounded off to the nearest integer) after which the TCP window scale option is needed. Let β be the maximum possible window size with window scale option. Then the values of α and β are **[2015]**

(A) 63 milliseconds, 65535×2^{14}
(B) 63 milliseconds, 65535×2^{16}
(C) 500 milliseconds, 65535×2^{14}
(D) 500 milliseconds, 65535×2^{16}

6. Consider the following statements

1. TCP connections are full duplex
2. TCP has no option for selective acknowledgement
3. TCP connections are message streams

(A) Only 1 is correct
(B) Only 1 and 3 are correct
(C) Only 2 and 3 are correct
(D) All of 1, 2 and 3 are correct

7. Which one of the following protocols is **NOT** used to resolve one form of address to another one? **[2016]**

(A) DNS (B) ARP
(C) DHCP (D) RARP

8. Which of the following is/are example(s) of stateful application layer protocols? **[2016]**

(i) HTTP (ii) FTP
(iii) TCP (iv) POP3

(A) (i) and (ii) only
(B) (ii) and (iii) only
(C) (ii) and (iv) only
(D) (iv) only

9. Identify the correct sequence in which the following packets are transmitted on the network by a host when a browser requests a webpage from a remote server, assuming that the host has just been restarted. **[2016]**

(A) **HTTP GET** request, **DNS** query, **TCP SYN**
(B) **DNS** query, **HTTP GET** request, **TCP SYN**
(C) **DNS** query, **TCP SYN, HTTP GET** request
(D) **TCP SYN**, **DNS** query, **HTTP GET** request

10. Consider a TCP client and a TCP server running on two different machines. After completing data transfer, the TCP client calls **close** to terminate the connection and a FIN segment is sent to the TCP server. Server-side TCP responds by sending an ACK, which is received by the client-side TCP. As per the TCP connection state diagram (RFC 793), in which state does the client-side TCP connection wait for the FIN from the server-side TCP? **[2017]**

(A) LAST-ACK
(B) TIME-WAIT
(C) FIN-WAIT-1
(D) FIN-WAIT-2

11. Consider socket API on a Linux machine that supports connected UDP sockets. A connected UDP socket is a UDP socket on which **connect** function has already been called. Winch of the following statements is/are CORRECT? **[2017]**

I. A connected UDP socket can be used to communicate with multiple peers simultaneously.
II. A process can successfully call **connect** function again for an already connected UDP socket.

(A) I only
(B) II only
(C) Both I and II
(D) Neither I nor II

12. Consider the following statements regarding the slow start phase of the TCP congestion control algorithm. Note that cwnd stands for the TCP congestion window

and MSS denotes the Maximum Segment Size.

(i) The cwnd increases by 2 MSS on every successful acknowledgment.

(ii) The cwnd approximately doubles on every successful acknowledgement.

(iii) The cwnd increases by 1 MSS every round trip time.

(iv) The cwnd approximately doubles every round trip time.

Which one of the following is correct? **[2018]**

(A) Only (ii) and (iii) are true

(B) Only (i) and (iii) are true

(C) Only (iv) is true

(D) Only (i) and (iv) are true

13. Consider a long-lived TCP session with an end-to-end bandwidth of 1 Gbps (= 10^9 bits-per-second). The session starts with a sequence number of 1234. The minimum time (in seconds, rounded to the closest integer) before this sequence number can be used again is ________. **[2018]**

- ☞ *Cryptographic techniques*
- ☞ *Encryptions*
- ☞ *Types of keys*
- ☞ *Traditional cipher algorithms*
- ☞ *Substitution cipher*
- ☞ *Traditional cipher*
- ☞ *Symmetric key encryption*
- ☞ *Asymmetric key encryption*
- ☞ *Diffie-hellman*
- ☞ *Digital signatures and certificates*

Network Security Basics

It is necessary to define some fundamental terms relating to network security and are the elements used to measure the security of a network. These terms are used to measure the security of a network. To be considered sufficiently advanced along the spectrum of security, a system must adequately address identification, integrity, accountability, non-repudiation, authentication, availability, confidentiality each of which is defined in the following sections:

Identification

Identification is simply the process of identifying one's self to another entity or determining the identity of the individual or entity, with whom you are communicating.

Authentication

Authentication serves as proof that you are who you say you are or what you claim to be. Authentication is critical if there is to be any trust between parties. Authentication is required when communicating over a network or logging into a network. When communicating over a network you should ask yourself two questions.

1. With whom am I communicating?
2. Why do I believe this person or entity is who he claims to be?

Access Control (Authorization)

This refers to the ability to control the level of access that individuals or entities have to a network or system and how much information they can receive. Level of authorization basically determines what you're allowed to do once you are authenticated and allowed access to a network, system or some other resource such as data or information. Access control is the determination of the level of authorization to a system, network or information.

Availability

This refers to whether the network, system, hardware and software are reliable and can recover quickly and completely in the event of an interruption in service. Ideally, these elements should not be susceptible to denial of service attacks.

Confidentiality

This is also be called privacy or secracy to the protection of information from unauthorized disclosure. Usually achieved either by restricting access to the information or by encrypting the information so that it is not meaningful to unauthorized individuals or entities.

Integrity

This can be thought of as accuracy, this refers to the ability to protect information, data, or transmissions from unauthorized, uncontrolled, or accidental alterations.

Accountability

This refers to the ability to track or audit what an individual or entity is doing on a network or system.

Non-repudiation

The ability to prevent individuals or entities from denying (repudiating) that information, data or files were sent or received or that information or files were accessed or altered, when infact they were. This capability is crucial in e-commerce, without if an individual or

entity can deny that he, she or it is responsible for a transaction and that he, she or it is, therefore, not financially liable.

Threats

A threat is anything that can disrupt the operation, functioning, integrity, or availability of a network or system. This can take any form and can be malevolent, accidental, or simply an act of nature.

Vulnerabilities

A vulnerability is an inherent weakness in the design, configuration, implementation, or management of a network or system that renders it susceptible to a threat. Vulnerabilities are what make networks susceptible to information loss and downtime. Every network and system has some kind of vulnerability.

Attacks

An attack is a specific technique used to exploit a vulnerability. For example, a threat could be a denial of service. A vulnerability is in the design of the operating system, and an attack could be a 'Ping of death'. There are two general categories of attacks:

1. Passive
2. Active

Passive attacks These are very difficult to detect because there is no overt activity that can be monitored or detected.

Examples of passive attacks would be packet sniffing or traffic analysis.

These types of attacks are designed to monitor and record traffic on the network. They are usually employed for gathering information that can be used later in active attacks.

Active attacks These employ more overt actions on the network or system. As a result, they can be easier to detect, but at the same time they can be much more devastating to a network.

Examples of this type of attack would be a denial-of-service attack or active probing of systems and networks.

Viruses

A virus, a parasitic program that cannot function independently, is a program or code fragment that is self propagating. It is called a virus, because like its biological counterpart, it requires a 'host' to function. In the case of a computer virus the host is some other program to which the virus attaches itself. A virus is usually spread by executing an infected program or by sending an infected file to someone else, usually in the form of an e-mail attachment.

Worm

A worm is a self-contained and independent program that is usually designed to propagate or spawn itself on infected systems and to seek other systems via available networks. The difference between a virus and a Worm is that a virus is not an independent program.

Trojan horses

A trojan horse is a program or code fragment that hides inside a program and performs a disguised function. A trojan horse program hides within another program or disguises itself as a legitimate program. This can be accomplished by modifying the existing program or by simply replacing the existing program with a new one. The Trojan horse program functions much the same way as the legitimate program, but usually it also performs some other function, such a recording sensitive information or providing a trap door. An example would be a 'password grabber'.

Logic bombs

A logic bomb is a program or subsection of a program designed with malevolent intent. It is referred to as a logic bomb, because the program is triggered when certain logical conditions are met. This type of attack is almost always perpetrated by an insider with privileged access to the network. The perpetrator could be a programmer or a vendor that supplies software.

Denial of service (DOS)

Denial of service attacks are designed to shut down or render inoperable a system or network. The goal of the denial-of-service attack is not to gain access or information but to make a network or system unavailable for use by other users. It is called denial-of-service attack, because the end result is to deny legitimate users access to network services.

Protection against network threats

Network threats may cause a massive harm to the system, as the network users are increasing, there is a good chance to attack a system protection against threats should be done.

To protect system form virus and worms, a security suite should be installed.

Similarly, to protect a system from Trojan horse, internet security suite prevents from downloading Trojan horse.

SPAM filters should be used to stop SPAM, this is available within the mail servers by default.

A strong encryption should be used to protect against packet sniffers, so that packets become unreadable making packet sniffers useless.

Cryptographic Techniques

For the exchange of information and commerce to be secure on any network, a system or process must be put in place that satisfies requirements for confidentiality, access control, authentication, integrity, and non-repudiation. The key

to the securing information on a network is cryptography. Cryptography can be used as a tool to provide privacy.

Traditionally, cryptography conjures up thoughts of spies and secret codes. In reality, cryptography and encryption have found broad applications in society. Every time you use an ATM machine to get cash or a point-of-sale machine to make a purchase, you are using encryption.

Encryption

Encryption is the process of scrambling the contents of a file or message to make it unintelligible to anyone not in possession of the 'key' required to unscramble it.

A cryptosystem or algorithm is the process or procedure to turn plain text into crypto text. A crypto algorithm is also known as a 'cipher'. Theoretically, all algorithms can be broken by one method or another. However, an algorithm should not contain an inherent weakness that an attacker can easily exploit

Example: Below is an example of a cipher, to scramble a message with this cipher, simply match each letter in a message to the first row and convert it into the number or letter in the second row. To unscramble a message, match each letter or number in a message to the corresponding number or letter in the second row and convert it into the letter in the first row.

A	B	C	D	E	F	G	H	I	J	K	L	M	N	O	P	Q	R	S	T	U	V	W	X	Y	Z
1	2	3	4	5	6	A	B	C	D	E	F	G	H	I	J	K	L	M	N	O	P	Q	R	S	T

To illustrate how this works see the following where the cipher is used to scramble the message:

'Little green apples'

Cipher text: FCNNF5 AL55H 1JJF5M
Clear text: LITTLE GREEN APPLES

This cipher would not be effective at keeping a message secret for long. It does not comply with one of the qualities of a truly effective cipher. Ciphers usually fall into one to two categories:

1. Block Ciphers
2. Stream Cipher

Stream ciphers

Steam cipher algorithms process plaintext to produce a stream of cipher text. The cipher inputs the plaintext in a stream and outputs a steam of cipher text.

Example:
Plaintext: LET US TALK ONE TO ONE
Cipher text: F5N OM NLFE ITS NI ITS

Stream cipher have several weaknesses. The most crucial short coming of stream ciphers is the fact that patterns in the plain text can be reflected in the cipher text. Knowing that certain words repeat makes breaking the code easier. In addition, certain words in the English language appear with predictable regularity. Letters of the alphabet also appear in predictable regularity. The most commonly used letters of the alphabet in the English language are E, T, A, O, N and I. The least commonly used letters are J, K, X, Q and Z. The most common combination of letters in the English language is '*th*', As a result, if a code breaker is able to find a '*t*' in a code, it doesn't take long to find an '*h*'.

Block ciphers

Block ciphers differ from stream ciphers in that they encrypt and decrypt information in fixed size blocks rather than encrypting and decrypting each letter or word individually. A block cipher passes a block of data or plaintext through its algorithm to generate a block of cipher text. Another requirement of block cipher is that the cipher texts should contain no detectable pattern.

Types of keys

We deal with three types of keys in cryptography:

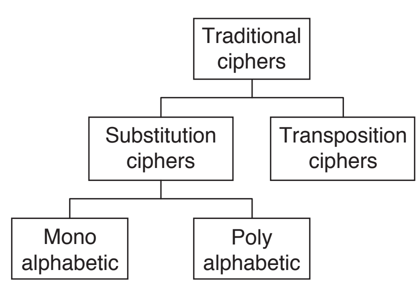
1. Secret key
2. Public key
3. Private Key

- The secret key, is the shared key used in symmetric-key cryptography.
- Public and Private keys are used in asymmetric-key cryptography.
- In symmetric-key cryptography, the same key locks and unlocks the box.
- In asymmetric-key cryptography, one key locks the box, but another key is needed to unlock it.

Traditional Cipher Algorithms

Traditional ciphers are character oriented, these ciphers can be divided into two broad categories:

1. Substitution ciphers
2. Transposition ciphers.



Substitution Cipher

A substitution cipher substitutes one symbol with another. If the symbols in the plain text are alphabetic characters, we replace one character with another. Substitution ciphers can be categorized as either mono-alphabetic or poly-alphabetic ciphers.

- In a mono-alphabetic cipher, a character or symbol in the plaintext is always changed to the same character or symbol in the cipher text regardless of its position in the text. For example if the algorithm says that character '*A*' in the plain text is changed to character '*E*', every character '*A*' is changed to character '*E*'.
- The relationship between characters in the plain text and the cipher text is a one-to-one relationship.
- In a poly-alphabetic cipher, each occurrence of a character can have a different substitute. The relationship between a character in the plain text to a character in the cipher text is a one-to-many relationship.
- To achieve this goal, we need to divide the text into groups of characters and use a set of keys.
- In substitution cipher, if 'a' becomes *D*, '*b*' becomes '*E*' then the word 'corrupt' becomes ETUUXSW, plain text will be given in lower case, and cipher text in upper case.
- A slight generalization of the ceasar cipher allows the cipher text alphabet to be shifted by '*K*' letters, instead of always '3'.
- The next improvement is to have each of the symbols in the plain text, say, the 26 letter for simplicity, map onto some other letter.

Example:

Plain Text	a	b	c	d	e	f	g	h	i	j
Cipher Text	L	N	O	B	R	M	S	U	V	Z

Plain text	k	l	m	n	o	p	q	r	s	t	u
Cipher Text	P	A	K	C	L	H	W	Q	X	Y	J

Plain Text	v	w	x	y	z
Cipher Text	E	F	D	G	J

Plain Text	corrupt
Cipher Text	OIQQJHY

- In this method, if a small cipher is given it can be broken easily. The basic attack takes advantage of the statistical properties of natural languages. For example, In English, '*e*' is the most common letter followed by *t*, *o*, *a*, *n*, *i* etc.
- The most common 2 letter combinations, are *th*, *in*, *er*, *re* and *an*.
- The most common three-letter combinations are are, the, ing, and, and ion.
- By making guesses at common letters, digrams and trigrams and knowing about likely patterns of vowels and consonants, the cryptanalyst builds up a tentative plaintext, letter by letter.

Transposition Ciphers

Substitution ciphers preserve the order of the plaintext symbols but disguise them.

Transposition ciphers, in contrast, reorder the letters but do not disguise them. Following figure depicts a common transposition cipher, the columnar transposition.

- The cipher is keyed by a word or phrase not containing any repeated letters.

Example: 'NETWORKS' is the key.
Plaintext: Transfer ten million dollars to my account.
What is the cipher text using transposition cipher?

Solution: Key: NETWORKS

N	E	T	W	O	R	K	S
3	1	7	8	4	5	2	6
T	r	a	n	s	f	e	r
t	e	n	m	i	l	l	i
o	n	d	o	l	l	a	r
s	t	o	m	y	a	c	c
o	u	n	t	a	b	c	d

The purpose of key is to number the columns, column 1 being under the key letter closest to the start of the alphabet, and so on.

The plain text is written horizontally in rows, padding is required to fill the matrix, if it is not complete'. The cipher text is read out by columns, starting with the column whose key letter is the lowest.

Plain text: Transfer ten million dollars to my account
Cipher Text: rentue laccttososilyafllabrircdandonnmomt.

Symmetric Key Encryption

Symmetric key, also referred to as private key or secret key, is based on a single key and algorithm being shared between the parties who are exchanging encrypted information. The same key both encrypts and decrypts messages.

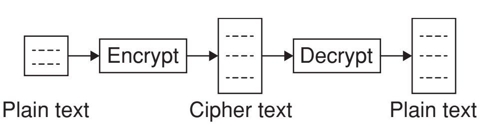


Figure 1 Symmetric key encryption

The strength of the scheme is largely dependent on the size of the key and on keeping it secret. Generally the larger the key, the more secure the scheme. In addition, symmetric key encryption is relatively fast. Private key cryptosystems are not well suited for spontaneous communication over open and unsecured networks. Symmetric key provides on process for authentication or non-repudiation.

Data Encryption Standard: (DES)

DES consists of an algorithm and a key. The key is a sequence of eight bytes, each containing eight bits for a 64 bit key. Since each byte contains one parity bit, the key is actually 56 bits in length. DES is widely used in automated teller machine (ATM) and point-of-sale (POS) networks, so if you use an ATM or debit card you are using DES.

Asymmetric Key Encryption

Asymmetric cryptography is also known as public key cryptography, public key cryptography uses two keys one is public key and the other is private key. The key names describe their function. One key is kept private, and the other key is made public. Knowing the public key doesn't reveal the private key. A message encrypted by the private key can only be decrypted by the corresponding public key. Conversely, a message encrypted by the public key can only be decrypted by the private key.

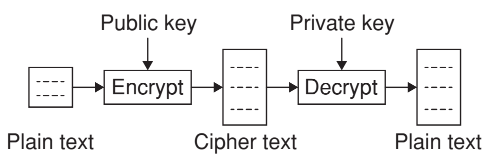

Figure 2 Asymmetric key encryption

With the aid of public key cryptography, it is possible to establish secure communications with any individual or entity when using a compatible software or hardware device.

There are three public key algorithms in wide use today:

1. Diffie–Hellman
2. RSA
3. Digital Signature Algorithm (DSA)

Diffie–Hellman

It was the first usable public key algorithm. Diffie–Hellman is based on the difficulty of computing discrete logarithms. It can be used to establish a shared secret key that can be used by two parties for symmetric encryption. Diffie–Hellman is often used for IPsec key management protocols. For spontaneous communications with Diffie–Hellman, two communicating entities would each generate a random number that is used as their private keys. They exchange public keys they each apply their private keys to the other's. public key to compute identical values (shared secret key). They then use the shared secret key to encrypt and exchange information.

Diffie–Hellman key exchange

The protocol that allows strangers to establish a shared secret key is called the Diffie–Hellman key exchange and works as follows:

- Ana and Brat have to agree on 2 large numbers, 'n' and 'g', where 'n' is a prime.
- $(n - 1)/2$ is also a prime and certain conditions apply to 'g'.
- These numbers may be public, so either one of them can just pick 'n' and 'g' and tell the other openly.
- Now Ana picks a large number (suppose 512-bit) 'x', and keeps it secret. Similarly Brat picks a large secret number, 'y'.
- Ana initiates the key exchange protocol by sending Brat a message containing (n, g, g^x mod n)
- Brat responds by sending Ana a message containing (g^y mod n)
- Now Ana raises the number Brat sent her to the xth power modulo 'n' to get $[(g^y \bmod n)^x \bmod n]$
- Brat performs a similar operation to get $[(g^x \bmod n)^y \bmod n]$, Both the calculations yield (g^{xy} mod n).

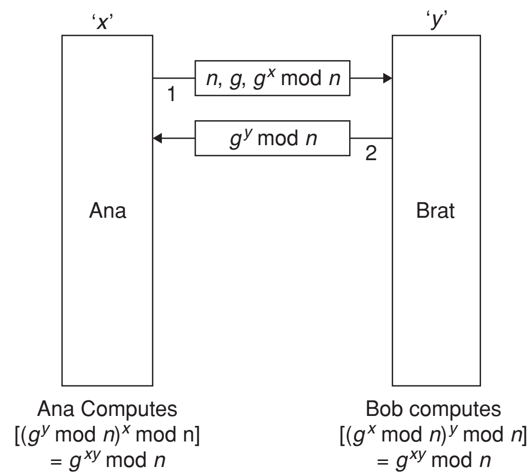

Figure 3 Diffie-Hellman key exchange

RSA (Rivest, Shamir, Adelman)

RSA multiplies large prime numbers together to generate keys. It's strength lies in the fact that it is extremely difficult to factor the product of large prime numbers. This algorithm is the one, most often associated with public key encryption. The RSA algorithm also provides digital signature capabilities.

Example:

- Select two large primes = p, q $p = 17$, $q = 11$
- $n = p \times q = 17 \times 11 = 187$
- calculate $\phi = (p - 1)\ (q - 1) = 16 \times 10 = 160$
- select e, such that LCD $(\phi, e) = 1$, $0 < e < \phi$ say, $e = 7$
- calculate d such that d mod $\phi = 1$
- $160\,k + 1 = 161, 321, 481, 641,$
- Check which of these is divisible by 7
- 161 is divisible by 7 giving $d = 161/7 = 23$
- Key 1 = {7, 187}, key 2 = {23, 187}

Digital Signatures

A digital signature allows a receiver to authenticate (to a limited extent) the identity of the sender and to verify the integrity of the message for the authentication process, you

must already know the senders public key, either from prior knowledge or from some trusted third party. Digital signatures are used to ensure message integrity and authentication. In its simplest from, a digital signature is created by using the senders private key to hash the entire contents of the message being sent to create a message digest. The recipient uses the sender's public key to verity the integrity of the message by recreating the message digest. By this process you ensure the integrity of the message and authenticate the sender.

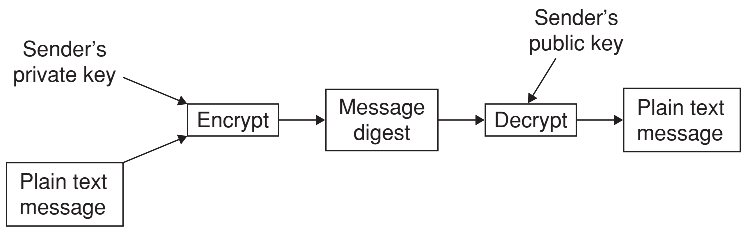

Figure 4 Digital signature

To sign a message, senders usually append their digital signature to the end of a message and encrypt it using the recipient's public key. Recipients decrypt the message using their own private key and verify the sender's identity and the message integrity by decrypting the sender's digital signature using the sender's pubic key. The strength of digital signatures are that they are almost impossible to counterfeit and they are easily verified.

Digital certificate

Digital signatures can be used to verify that a message has been delivered unaltered and to verify the identify of the sender by public key. The problem with authenticating a digital signature, however, is that you must be able to verify that a public key does in fact belong to the individual or entity that claims to have sent it and that the individual or entity is in fact who or what it claims to be.

A digital certificate issued by a certification authority (CA) utilizing a hierarchical public key infrastructure (PKI) can be used to authenticate a sender's identify for spontaneous, first–time contacts. Digital certificates provide a means for secure first time spontaneous communication. A digital certificate provides a high level of confidence in the identify of the individual.

A digital certificate is issued by a trusted/unknown third party (CA) to bind an individual or entity to a public key. The digital certificate is digitally signed by the CA with the CA's private key. This provides independent confirmation that an individual or entity is in fact who it claims to be. The CA issued digital certificates that certify for the identities of those to whom the certificates were issued.

Firewalls

Firewall is a control link between internet and organization intranet. It protects network premises from internet based attacks by providing single choke point. All the network traffic is forced to travel through this fire wall. Firewall allows only authorized traffic to pass through.

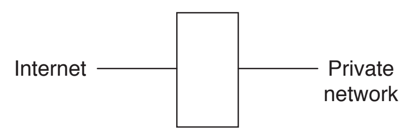
The different types of firewalls are:

1. Packet – filtering router
2. Application level gateways
3. Circuit level gateways
4. Bastion host

Packet filtering router

It filters packets with incoming and outgoing interfaces, and permits or denies certain services. It uses the information of transport layer like IP sources, ICMP message etc.

The drawbacks are IP address spoofing, tiny fragment attack and source routing attacks.



Application level gateway

It provides proxies for each service, when user requests service, it validates the request as legal one and return results to the user.

Application level gateway is more secure than the packet filter.

The drawback of this gateway is processing overhead at each connection.

Circuit-level gateway

It is application level gateway functionality for certain applications. It does not allow end-end TCP connection, rather it maintains two connections, one with the inner host and the other with the outer host. Once the connections are established TCP segment is allowed without examining contents. It only checks the incoming data.

Bastion host

It provides a platform for the application gateway (or) circuit level gateway, it is a critical strong point in network security.

An additional authentication is required for the user who want access to proxy services. Even proxy service authenticates itself before granting the access to user.

Only essential services are installed in the Bastion host which are decided by admin.

Exercises

Practice Problems 1

Directions for questions 1 to 15: Select the correct alternative from the given choices.

1. In an encryption scheme that uses RSA, values, for p and q are selected to be 5 and 7 respectively what could be the value of d?
   (A) 12 (B) 3 (C) 11 (D) 9
2. A person x is supposed to send a document with digitized signature to another person y using public key Cryptography. p is the message. D_x, D_y are private keys of x and y respectively. E_x, E_y are public keys of x, y respectively. Select the best possible sequence of events from below:
   (i) $D_x\ (p)$
   (ii) $D_y\ (p)$
   (iii) $E_y\ (D_x(p))$
   (iv) $D_y\ (D_x(p))$
   (v) $D_y(E_y(p))$
   (vi) $D_y(E_y(D_x(p))$
   (vii) $E_x(D_x(p))$
   (viii) $E_y(p)$
   (ix) $E_x(D_y(p))$
   (x) $D_x(E_y(p))$
   (A) (ii), (ix), (viii), (v) (B) (viii), (x), (v), (i)
   (C) (i), (iii), (v), (vii) (D) (vii), (v), (iii), (i)
3. Select correct statements about PGP:
   (i) Uses existing cryptographic algorithms that have been quite successful.
   (ii) Support text compression, digital ignatures.
   (iii) Takes plaintext as feed and generates base-64 text.
   (iv) No key management capability is rovided.
   (A) (i), (ii), (iii) (B) (ii), (iii), (iv)
   (C) (i), (iii), (iv) (D) (i), (ii), (iv)

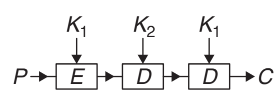
Linked answer questions 4 and 5:

4. Using mono alphabetic substitution a string a b b a c a a b c d is transformed to one of the below strings. Select the most appropriate option:
   (A) p q q p r p p s r s (B) j t t x j j i t x t x
   (C) u s s u a u u s a b (D) d c c d b b b c b a
5. Using the mapping obtained above, encrypt the phrase 'bad cab' using same method: Assume space is not encrypted.
   (A) q p s r p q (B) t j z x j t
   (C) s u b a u s (D) c d a b d c
6. Select the correct statements with regard to packet filters of a firewall:
   (i) They are usually driven by a table with information in regards to acceptable sources and destinations.
   (ii) Default rules about what needs to be done in regards to packets coming from or going to other machines.
   (iii) Can block TCP ports.
   (A) (i), (ii) (B) (ii), (iii)
   (C) (i), (iii) (D) (i), (ii), (iii)
7. What is meant by non-repudiation in the area of digital signatures?
   (A) Receiver verifying the signature of the sender.
   (B) Receiver concocting the message.
   (C) Sender denying having signed digitally.
   (D) Receiver changing the contents after receiving the signed document.
8. Which of the following statements about DES is/are true?
   (i) DES is public key algorithm.
   (ii) DES has 19 distinct stages.
   (iii) In the 16 iterations of DES, different keys are used.
   (A) (i), (ii) (B) (ii), (iii)
   (C) (i), (iii) (D) (i), (ii), (iii)
9. Which of the below represents Triple encryption using DES? (P is the unencrypted input, 'C' is encrypted output, k_1, k_2, k_3 are keys used in encryption and decryption, E stands for encryption and D stands for decryption).
   (A)

   (B)

   (C)

   (D)



10. Which of the below statements are applied for cipher block chaining?
    (i) Each plaintext block is XOR'ed with previous block before encryption.
    (ii) Encryption is a mono alphabetic substitution cipher.
    (iii) Cipher block chaining can result in same plaintext blocks encrypted to different cipher text blocks.
    (A) (i), (ii) (B) (ii), (iii)
    (C) (i), (iii) (D) (i), (ii), (iii)
11. Which of the below statements are applied to RSA algorithm?
    (i) RSA is a relatively slow algorithm when encrypting large data.
    (ii) Mainly used where key is to be distributed.
    (iii) The strength of the algorithm lies in the fact that determining the key can take exceedingly long time by brute force.

(A) (i), (ii) (B) (ii), (iii)
(C) (i), (iii) (D) (i), (ii), (iii)

12. The security and usefulness of a digital signature depends on
(A) A public hash function
(B) A two-way hash function
(C) Protection of user's private key
(D) Protection of user's public key

13. Let '*M*' be the message to be encrypted, *E* be Encryption key and *N* be the product of two random prime numbers, then what is the cipher text using RSA algorithm?
(A) $C = E^m \bmod N$ (B) $C = M^E \bmod N$
(C) $C = N^E \bmod M$ (D) $C = E^N \bmod M$

14. Which of the following best describes the decryption in Triple DES?
(A) Plain text $= D_{K_1}(E_{K_2}(D_{k_1}(\text{ciper text})))$
(B) Plain text $= D_{K_1}(E_{K_2}(D_{k_3}(\text{ciper text})))$
(C) Plain text $= E_{K_1}(D_{K_2}(E_{k_1}(\text{ciper text})))$
(D) Plain text $= E_{K_1}(D_{K_2}(E_{k_1}(\text{ciper text})))$

15. In which cipher mode, all cipher blocks will be chained so that if one is modified the cipher text cannot be decrypted correctly?
(A) Electronic Code Book
(B) Cipher Block Chaining
(C) Cipher Feedback Mode
(D) Counter Mode

Practice Problems 2

Directions for questions 1 to 15: Select the correct alternative from the given choices.

1. 'All algorithms must be public only the keys are secret' is
(A) Rijndael Principle
(B) Kerckhoff's principle
(C) Rivest shamir Adleman principle
(D) None of these

2. Pretty Good Privacy encrypts data by using a block cipher called
(A) RSA (B) MD5
(C) IDEA (D) DES

3. E-mail security package is related to
(A) Pretty Good Privacy
(B) DNS spoofing
(C) Secure Socket Layer
(D) Transport Layer Security

4. Which of the following protocols will be proxy, on an application firewall?
(A) IPX (B) FTP
(C) POP (D) SMS

5. A good recommendation is that if a private key is ____ or longer, the key is thought to be secure.
(A) 40 bits (B) 60 bits
(C) 70 bits (D) 80 bits

6. Which issue is related to server side security?
(A) Protection of the server from legitimate web access
(B) Security of the information stored on server
(C) Security of the customer's physical credit card
(D) Security of the customer's computer

7. Which of the following is not an active attack?
(A) Denial of service (B) Traffic Analysis
(C) Replay (D) Masquerade

8. Verifying the true identity of the sender of a message recipient is known as _____.
(A) Authentication (B) fabrication
(C) Cryptography (D) availability

9. In which of the following techniques, letters are arranged in a different order?
(A) Transposition
(B) Substitution
(C) Private key Encryption
(D) None of the above

10. In which type of attack, Algorithm, cipher text, chosen plaintext and cipher text are known?
(A) Cipher text only
(B) Known plain text
(C) Chosen cipher text
(D) Chosen text

11. In which type of ciphers the encryption depends on current state?
(A) Link cipher
(B) Block cipher
(C) Stream cipher
(D) Current cipher

12. Traffic Analysis can be counted using
(A) Encryption (B) Decryption
(C) Replay (D) Data padding

13. DES Algorithm is vulnerable to
(A) Masquerade attack
(B) Replay attack
(C) Denial of service
(D) Brute Force attack

14. What is the size of key in Triple DES?
(A) 168 bits (B) 112 bits
(C) 56 bits (D) Either (A) or (B) or (C)

15. Direct digital signature involves
(A) Source only
(B) Destination only
(C) Communicating parties, sender and receiver.
(D) Everyone including communicating parties.

Previous Years' Questions

1. Suppose that everyone in a group of N people wants to communicate secretly with the $N - 1$ others, using symmetric key cryptographic system. The communication between any two persons should not be decodable by the others in the group. The number of keys required in the system as a whole to satisfy the confidentiality requirement is **[2015]**
   (A) $2N$ (B) $N(N - 1)$
   (C) $N(N - 1)/2$ (D) $(N - 1)^2$

2. Consider that B wants to send a message m that is digitally signed to A. Let the pair of private and public keys for A and B be denoted by K_x^- and K_x^+ for $x = A, B$, respectively. Let $K_x(m)$ represent the operation of encrypting m with a key K_x and $H(m)$ represent the message digest. Which one of the following indicates the CORRECT way of sending the message m along with the digital signature to A? **[2016]**
   (A) $\{m, K_B^+ (H(m))\}$ (B) $\{m, K_B^- (H(m))\}$
   (C) $\{m, K_A^- (H(m))\}$ (D) $\{m, K_A^+ (m)\}$

3. Anarkali digitally signs a message and sends it to Salim. Verification of the signature by Salim requires **[2016]**
   (A) Anarkali's public key.
   (B) Salim's public key.
   (C) Salim's private key.
   (D) Anarkali's private key.

4. A sender S sends a message m to receiver R, which is digitally signed by S with its private key. In this scenario, one or more of the following security violations can take place.
   (I) S can launch a birthday attack to replace m with a fraudulent message.
   (II) A third party attacker can launch a birthday attack to replace m with a fraudulent message.
   (III) R can launch a birthday attack to replace m with a fraudulent message.

   Which of the following are possible security violations? **[2017]**
   (A) (I) and (II) only (B) (I) only
   (C) (II) only (D) (II) and (III) only

5. In a RSA cryptosystem, a participant A uses two prime numbers $p = 13$ and $q = 17$ to generate her public and private keys. If the public key of A is 35, then the private key of A is __________. **[2017]**

Test

Computer Networks

Time: 60 min.

Directions for questions 1 to 30: Select the correct alternative from the given choices

1. What is the Hamming distance between 000, 011?
(A) 0 (B) 1
(C) 2 (D) 3

2. Consider the given data:

Dataword	Codeword
00	00000
01	01011
10	10101
11	11110

Find the minimum hamming distance?
(A) 2 (B) 3
(C) 4 (D) 5

3. In Go-back-n, what should be the Window size?
(A) 2^m (B) 2^{m-1}
(C) 2^{m-2} (D) 2^{2m}

4. If there are 16 sequence numbers, what are the sender and receiver window sizes in go-back-n and selective repeat respectively?
(A) (15, 1) (8, 8) (B) (14, 2) (8, 8)
(C) (15, 1) (7, 8) (D) (15, 1) (8, 7)

5. A code needs to be designed with 8 data bits and r check bits. What is the minimum value of r in order to correct single bit errors?
(A) 1 (B) 2
(C) 3 (D) 4

6. A code has hamming distance of 6. What is the maximum number of bit errors that can be corrected?
(A) 1 (B) 2
(C) 3 (D) 4

7. In the above case what is the number of errors that can be detected?
(A) 3 (B) 4
(C) 5 (D) 6

8. CRC is being used to do error detection and correction. The frame with data 101001001 needs to be sent and the generator polynomial being used is $x^4 + x + 1$. What is the final transmitted frame?
(A) 1010010011110 (B) 1010010010010
(C) 1010010011010 (D) 1010010010000

9. OSI model seven layer is based on which of the following principles:
(A) A layer should be created where a different level of abstraction is needed
(B) Each layer should perform a well defined function
(C) The layer boundaries should be chosen to minimize the information flow across the interfaces
(D) All the above

10. Which of the following is/are the tasks of physical layer?
(A) How to link two or more devices physically
(B) What type of data flow is needed between two devices
(C) Type of topology required
(D) All the above

11. The functions of the data link layer are
(A) It provides services to network layer and accepts services from physical layer
(B) It is responsible for error control and detection within the network.
(C) It regulates the amount of data that can be transmitted on one line
(D) All the above

12. Which one of the following layers deals with problems that arise when packet travels from one network to another?
(A) Transport layer (B) Physical layer
(C) Data link layer (D) Network layer

13. What is the main function of the network layer?
(A) Routing
(B) Congestion control
(C) Both (A) and (B)
(D) None of these.

14. Which layer ensures interoperability among the communicating devices, and also computers to communicate even if their internal representation is different?
(A) Session layer (B) Transport layer
(C) Presentation layer (D) Application layer

15. Which of the following is not a layer in TCP/IP reference model?
(A) Application layer (B) Transport layer
(C) Data link layer (D) Host to Network layer

16. Suppose we want to transmit a character 'C', the binary value is 1000011 if we pass through an even parity generator then the output is
(A) 10000110 (B) 10000111
(C) 1000011 (D) 1000010

17. What type of frames can be recognized by stop and wait protocols?
(A) Damaged frames
(B) Lost frames
(C) Lost of acknowledgement frames
(D) All the above

18. IEEE project 802 divides the data link layer into two sub layers. What is the upper sublayer?
(A) LLC (B) MAC
(C) PDU (D) HDLC

Common data for questions 19 and 20: When a data frame, arrives at the receiver, instead of sending an acknowledgement separately the receiver rests itself and waits until the network layer passes it the next packet. The acknowledgement is attached to the outgoing data frame.

19. The technique of temporarily delaying outgoing ACK so that they can be hooked onto the next outgoing data frame is called______
(A) Pipelining (B) Piggybacking
(C) Flooding (D) None

20. Which layer implements technique of piggybacking?
(A) Physical layer (B) Data link layer
(C) Transport layer (D) Session layer

21. What is the protocol used in one bit sliding window protocol?
(A) Unrestricted simplex
(B) Simplex stop and wait
(C) Simplex protocol for noisy channel
(D) Restricted duplex.

22. The technique of keeping the sender window appropriately in such a way, that it can continuously transmit frames for a time equal to the round trip time, so that acknowledgement of first frame will arrive just after transmitting the last frame, is called
(A) Flooding (B) Piggy backing
(C) Pipelining (D) Selective repeat

23. Pick the incorrect statement from the following
(A) Go-Back-N method requires more storage at the receiving side.
(B) Selective repeat involves complex logic than Go-back-N
(C) Go-back-N has better line utilization
(D) Selective repeat has better line utilization

24. In stop and wait flow control, to send 'n' data packets how many acknowledgements are needed.
(A) n (B) $2n$
(C) $n - 1$ (D) $n + 1$

25. In sliding window flow control, if the window size is 64 what is the range of sequence numbers?
(A) 0 to 63 (B) 0 to 64
(C) 1 to 63 (D) 1 to 64

26. In Go-Back-N Automatic Repeat Request (ARR), if frames 4, 5, 6 are received successfully, the receiver will send which ACK number to the sender?
(A) 5 (B) 6
(C) 7 (D) 4

27. Which of the following are the responsibilities of a token ring monitor station?
(A) Check to see that token is not lost
(B) Taking action when ring breaks
(C) Clearing the ring when garbled frames appear
(D) All the above

Common data for questions 28 and 29:

28. In ISO-OSI reference model the layer that provides necessary translation of different control codes, character set and graphic character and it ensures interoperability among communicating devices.
The above explanation is about which of the following layers?
(A) Session layer
(B) Data link layer
(C) Presentation layer
(D) Application layer

29. What are the other tasks performed by the above layer?
(A) Encryption and compression
(B) Token management and synchronization
(C) Error detection and error correction
(D) None of these

30. The layer that takes a raw transmission and transforms it into a line that appears free of undetected transmission errors and it takes care of traffic regulation to keep fast transmitter from drowning slow receiver. The layer that provides these services is
(A) Physical layer (B) Transport layer
(C) Data link layer (D) Application layer

Computer Networks Test I

Number of Questions: 35 **Section Marks: 30**

Directions for questions 1 to 35: Select the correct alternative from the given choices.

1. Among the following network topologies, which has the highest reliability?
(A) Mesh topology (B) Bus topology
(C) Star topology (D) Ring topology

2. Which one of the following uses UDP as transport protocol?
(A) SMTP (B) HTTP
(C) POP (D) DNS

3. The transport layer protocol that is used to support electronic mail is?
(A) IP (B) UDP
(C) TCP (D) SMTP

4. Find the number of characters per sec (7 bits + 1 priority) that can be transmitted over 4800 bps line using synchronous transfer. (1 start & 1 stop bit)?
(A) 480 (B) 500
(C) 600 (D) 520

5. Find the number of cross points needed for 15 lines in a cross point switch which is full duplex in nature and there are no self connection?
(A) 225 (B) 105
(C) 30 (D) 60

6. What is the maximum data rate of a channel for a noiseless 6 KHz binary channel?
(A) 12000 bps (B) 12 bps
(C) 3000 bps (D) 800 bps

7. Which of the following statements are true about flooding?
I. It is a type of isolated routing
II. Selective flooding is a type in which the packets are sent to those lines that are going approximately in the right direction
III. It is a method in which every incoming packet is sent out on every outgoing line except the one on which it has arrived.
IV. Flooding does not always select the shortest path
(A) I and III (B) II and III
(C) I, II, III and IV (D) I, II and III

8. Which one of the following is not a standard RS232C signal?
(A) RTS (B) VDR
(C) DSR (D) CTS

9. What happens to the size of congestion window in the slow start phase of TCP congestion algorithm?
(A) Increases linearly
(B) Does not change
(C) Increase exponentially
(D) Increase quadratically

10. A company has a class B network and they wanted to subdivide the network to all the 32 departments. The subnet mask would be
(A) 255. 255. 0. 0 (B) 255. 255. 248. 0
(C) 255. 255. 32. 0 (D) 255. 255. 252. 0

11. Which one of the following is true about a layer–4 firewall (can look at all protocol headers upto the transport layer)?
(A) Cannot block all ICMP traffic
(B) Cannot block entire HTTP traffic during 9.00 pm and 5.00 am
(C) Cannot block TCP traffic from a specific user on a multi user system during 9.00 pm and 5.00 am
(D) Cannot stop incoming traffic from a specific IP address but allow outgoing traffic to the same IP address

12. What is the maximum window size for data transmission using the selective Repeat protocol with 8 bit frame sequence number?
(A) 128 (B) 64
(C) 256 (D) 255

13. Which one of the following is not a network layer protocol?
(A) ICMP (B) DHCP
(C) RARP (D) SDLC

14. Find the number of connections in a mesh network with 10 nodes?
(A) 45 (B) 100
(C) 101 (D) 55

15. Find the number of networks allowed under class B address of an IPV_4 network?
(A) 2^{22} (B) 2^{24}
(C) 2^{14} (D) 2^{16}

16. Station A sends data to station B over a full duplex link. Both A and B are using the sliding window protocol for flow control. The window size of sender and receiver is 6 packets each. Data packets (sent only from A to B) are all 700 bytes long and the transmission time for such a packet is 60 µs. Acknowledgement packets that are sent only from B to A are very small and require negligible transmission time. The propagation delay over the link is 120 µs. What is the maximum achievable throughput in this communication?
(A) 20×10^6 bps (B) 70×10^6 bps
(C) 50×10^6 bps (D) 60×10^6 bps

17. Which of the following shows the Hamming distance of following strings Respectively.
I. 1101101 and 1101100
II. 1110111 and 1111011
III. 1111011 and 0011001
(A) 2, 1, 3 (B) 1, 2, 3
(C) 3, 2, 1 (D) 1, 1, 2

18. Find the minimum frame size for a 20 Mbps Ethernet having 56 bit jamming signal and round trip propagation delay of 64 μs:
(A) 2560 (B) 640
(C) 1336 (D) 320

19. Find the maximum number of hosts per subnet on a class B network with a subnet mask of 255.255.252.0:
(A) 1024 (B) 2046
(C) 2048 (D) 1022

20. Match the following:

I.	Telnet	1.	Session layer
II.	DHCP	2.	Application layer
III.	RPC	3.	Data link layer
IV.	HDLC	4.	Network layer
		5.	Presentation layer

(A) I–2, II–1, III–5, IV–4
(B) I–2, II–4, III–1, IV–5
(C) I–2, II–1, III–5, IV–3
(D) I–2, II–4, III–1, IV–3

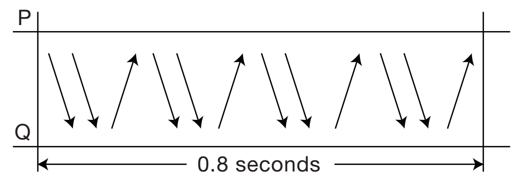
21. Consider the RSA public key cryptosystem with the private and public keys as (e, n) and (d, n) respectively, where $n = p * q$ and p and q are large primes. Besides 'n' is public, p and q are private. Let m be an integer such that $0 < m < n$ and $z = (p - 1)(q - 1)$, Then which of the following equations correctly represent RSA cryptosystem?
I. $m^1 = m^e \bmod z$
$m = (m^1)^d \bmod z$
II. $ed = 1 \bmod z$
III. $m^1 = m^e \bmod n$
$m = (m^1)^d \bmod n$
IV. $ed = 1 \bmod n$
(A) II and III (B) III and IV
(C) I and II (D) I and IV

22. Which of the following conditions must be satisfied by a polynomial generator used for CRC to detect odd number of errors?
I. It should be divisible by x
II. It should not be divisible by x
III. It should be divisible by $1 + x$
IV. It should not be divisible by $1 + x$
(A) I and IV (B) II and III
(C) II and IV (D) I and III

23. Consider an IPV_4 diagram, the M bit is 0, the value of header length is 20, the value of total length is 500 and the fragment offset value is 400. The sequence number of first and last bytes of payload along with the position of the datagram are respectively.
(A) 3200, 3619, First fragment
(B) 3200, 3619, Last fragment
(C) 3200, 3819, Last fragment
(D) 1800, 3819, Middle fragment

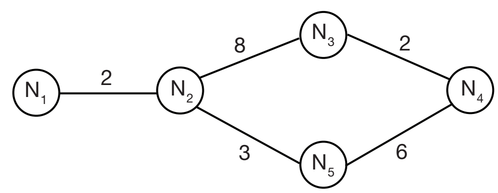
24. A 64 kbps pure ALOHA channel is to be shared among a number of stations, each sending 1k bit frames, on an average one frame every 10 seconds. Assume that sender can buffer frames to handle unsuccessful sendings.
What is the maximum number of stations this network can support? (A pure ALOHA channel has a maximum capacity of 18.4%).
(A) 111 (B) 117
(C) 122 (D) 124

25. The exchange of Ethernet frames between two computers P and Q is shown in the figure below. The connection uses 10 BaseT hub and each frame sent by computer P contains 1500 B of Ethernet payload data, while each frame sent by computer Q contains 100 B of Ethernet payload data. Find the average utilization of the media during this exchange?



(A) 5.68% (B) 10.24 %
(C) 1.27 % (D) 15.67 %

Linked Data Questions 26 and 27:
Consider a network with five nodes as shown in the figure.



The above network uses distance vector routing protocol. The distance vector is the distance of the best known path at that instance to nodes. The distance of a node to itself is zero. All the links are symmetric & the cost is same in both directions. Initially the distance vector at different nodes is
N_1 : (0, 2, 10, 11, 5)
N_2 : (2, 0, 8, 9, 3)
N_3 : (10, 8, 0, 2, 8)
N_4 : (11, 9, 2, 0, 6)
N_5 : (5, 3, 8, 6, 0)
In each round, all nodes exchange their distance vectors with their respective neighbours. Then all the nodes update their distance vectors. In between 2 rounds, any change in cost of a link will cause the two incident nodes to change only that entry in their distance vectors.

26. The cost of link $N_2 - N_3$ is reduced by 4 (in both directions). After the next round of updates what will be the new distance vector at node N_3?
(A) (6, 4, 0, 2, 7)
(B) (10, 4, 0, 2, 8)
(C) (10, 4, 0, 2, 7)
(D) (6, 4, 0, 2, 8)

27. After the update in the above question the link $N_1 - N_2$ goes down. N_2 will reflect this change immediately in its distance vector at cos t α. After the next round of update, what will be the cost to N_1 in the distance vector of N_3?
(A) 13 (B) ∞
(C) 11 (D) 6

28. The CIDR based IP address for an ISP is given as 252.246.128.0/21. The ISP wants to give half of this address to organization X and a quarter to organization Y, while retaining the remaining with itself. Which of the following is a valid allocation of addresses to X and Y?
(A) 252.246.128.0/20 and 252.246.128.0/21
(B) 252.246.136.0/20 and 252.246.128.0/21
(C) 252.246.128.0/22 and 252.246.136.0/23
(*D* 252.246.128.0/21 and 252.246.136.0/22

29. In Ethernet CSMA/CD, the special bit sequence transmitted by media access management for collision handling is called:
(A) jam (B) Preamble
(C) Postamble (D) None of the above

30. Which one of the following network routing method uses every possible path between the sender and receiver terminal?
(A) Directory routing (B) Random routing
(C) Message switching (D) Packet flooding

31. Which one of the following statements are correct?
(A) Baseband network uses analog technology
(B) Baseband network is Time Division Multiplexed
(C) In Broadband network, the carrier signals operate at low frequency
(D) Broadband network uses digital technology

32. How many number of bytes are there for a header in TCP segment and UDP segment respectively?
(A) 16 bytes and 8 bytes (B) 8 bytes and 16 bytes
(C) 8 bytes and 20 bytes (D) 20 bytes and 8 bytes

33. Which of the following statements about DES is/are true?
(i) DES is asymmetric key encryption
(ii) DES is symmetric key encryption
(iii) DES uses different keys in each of the 16 iterations
(A) Only I (B) Only II
(C) I and III (D) II and III

Common Data Questions 34 and 35:
Consider the routing table below.

Destination	Gateway	Mask	Flags	Interfaces
175.220.105.128	175.220.105.164	225.255.255.136	U	eth0
192.128.1.0	192.128.1.1	255.255.255.0	U	eth1
127.0.0.1	127.0.0.1	255.0.0.0	U	Loop back 0
Default	175.220.105.129	255.255.255.255	UG	eth0

34. How many local subnets is this machine attached to?
(A) 1 (B) 2
(C) 3 (D) 4

35. How many IP addresses can this machine reach to (excluding the loop back router)?
(A) 128 (B) 512
(C) 384 (D) 256

Answer Keys

1. A	**2.** D	**3.** C	**4.** C	**5.** B	**6.** A	**7.** D	**8.** B	**9.** C	**10.** B
11. C	**12.** A	**13.** D	**14.** A	**15.** C	**16.** B	**17.** B	**18.** C	**19.** D	**20.** D
21. A	**22.** B	**23.** B	**24.** B	**25.** C	**26.** A	**27.** A	**28.** C	**29.** A	**30.** D
31. B	**32.** D	**33.** D	**34.** B	**35.** C					

Hints and Explanations

4. $\frac{4800}{8}$ · Here start & stop bits are not considered as transfer is synchronous Choice (C)

5. $\frac{n(n-1)}{2} = \frac{15 \times 14}{2} = 105$ Choice (B)

6. $2H \log_2 v$ H → Band width
V → Discrete level
Here $H = 6$ – KHz and $V = 2$
$2 \times 6000 \log_2 2$ Choice (A)

12. $2^{(n-1)} = 2^{(8-1)} = 2^7$ Choice (A)

14. Number of connections $= \frac{n(n-1)}{2}$
n → no. of nodes Choice (A)

16. Maximum achievable throughput

$$= \frac{\text{Total size}}{\text{Total time}} = \frac{6 \times 700 \times 8}{(6 \times 60 + 120) \times 10^{-6}}$$

Total packet size = packet size × window size
Total time = Transmission time + propagation time

Choice (B)

17. I.

$$\begin{array}{l} 1101101 \\ 1101100 \\ \hline 0000001 \\ \hline \end{array}$$

Hamming distance is 1

II.

$$\begin{array}{l} 1110111 \\ 1111011 \\ \hline 0001100 \\ \hline \end{array}$$

Hamming distance is 2

III.

$$\begin{array}{l} 1111011 \\ 0011001 \\ \hline 1100010 \\ \hline \end{array}$$

Hamming distance is 3 Choice (B)

18. Minimum frame size
= 2 × propagation delay × Band width
= $64 \times 10^{-6} \times 20 \times 10^{6} = 1280$
[Round trip time = 2 × propagation delay]
$\Rightarrow$ 1280 + 56 = 1336 Choice (C)

19. 255.255.252.0 ↔ 11111111.11111111.

$$111111\underbrace{00.00000000}_{10 \text{ bits}}$$

No. of hosts per subnet = $2^{10} - 2 = 1024 - 2 = 1022$

Choice (D)

23. $M = 0$, means no more fragmentation i.e. the last fragment
Header Length = 20 × 4 = 80 bytes
Payload = 500 – 80 = 420 (0 – 419)
Fragment offset = 400 × 8 = 3200 bytes
Seq. No. of Ist fragment = 3200
Seq. No. of last fragment = 3200 + 419 = 3619

Choice (B)

24. Average data rate per station is 1,000 bits/10 sec or 100 bps.
A pure ALOHA channel has a maximum capacity of 18.4%
A 64 kbps channel would send
= 64,000 × 0.184
= 11, 776 bps
We can move 11,776 bps through this channel when managed by pure ALOHA and at its maximum throughput.

$\therefore \frac{11776}{100} = 117$ stations can be supported with 64 kbps pure ALOHA channel. Choice (B)

25. Number of frames from P to Q = 8
Ethernet MAC frame payload = 1500 = 1500 + 26
= 1526 bytes = 12208 bits
Number of frames from Q = 4
Frame payload = 100 B
100 + 26 = 126 bytes
126 × 8 = 1008 bits
Total utilized bandwidth = 12208 × 8 + 1008 × 4
= 101696 (achieved capacity) but actual capacity is 10 Mbps (10 Base T)

Utilization $= \frac{101696}{8 \times 10 \times 10^{6}} = 1.27\%$ Choice (C)

26. N_3: (6, 4, 0, 2, 7) Choice (A)

28. Total bit mask = 21
To allocate half of host to X need 10 bit i.e. 2^{10} host
$\therefore$ Mask for X = 22 bits

To allocate $\frac{1}{4}$ of host to Y need 9 bit i.e. 2^{9} host

Mask for Y (32 – 9) = 23 bits Choice (C)

35. 2^7 (in first n/w) + 2^8 (in second n/w)

Choice (C)

Computer Networks Test 2

Number of Questions: 35 **Section Marks: 30**

Directions for questions 1 to 35: Select the correct alternative from the given choices.

1. In data link layer, the error detection is achieved by
   (A) Hamming code
   (B) Bit stuffing
   (C) Cyclic redundancy codes
   (D) Equalization

2. Which of the following statements are true about a carrier sense network, if the current status is "channel busy"?
   I. If the technique used is non-persistent then it results in randomized wait and sense
   II. If the technique used is non-persistent then it senses continuously
   III. If the technique used is 1-persistent then the channel is continually sensed
   IV. If the technique used is *p*-persistent then randomized retransmission is done
   (A) I and III (B) I, III and IV
   (C) II and III (D) II, III and IV

3. Which one of the following is a sample of client server application?
   (A) Network printing (B) E-mail
   (C) WWW (D) All the above

4. Find the number of characters per second (7 bits + 1 parity) that can be transmitted over a 8400 bps line using asynchronous transfer.
   (1 start & 1 stop bit)?
   (A) 820 (B) 420
   (C) 620 (D) 840

5. A terminal multiplexer has four 1200 bps terminals and '*n*' 600 bps terminals connected to it. The outgoing line is 9600 bps, what is the maximum value of '*n*'?
   (A) 16 (B) 4
   (C) 32 (D) 8

6. Which layer of the OSI model provides end to end connectivity between the hosts?
   (A) Session layer (B) Network layer
   (C) Transport layer (D) Data link layer

7. Which one of the following measures the number of lost or garbled messages as a fraction of the total sent in the sampling period?
   (A) Residual Error rate
   (B) Connection release failure probability
   (C) Connection establishment failure probability
   (D) Transfer failure probability

8. What is the use of Time-To-Live (TTL) field in the header fields of IP datagram?
   (A) To reduce delays
   (B) To prioritize packets
   (C) To prevent packet looping
   (D) To optimize throughput

9. The number of networks allowed under class C address of an IPv4 network is:
   (A) 2^{21} (B) 2^{24}
   (C) 2^{16} (D) 2^{8}

10. Which one of the following is true about an address resolution protocol (ARP)?
    (A) Used to find IP address that corresponds to a MAC address
    (B) Used to find MAC address that corresponds to an IP address
    (C) Does not perform the translation between IP addresses and MAC layer addresses
    (D) ARP is not a member of the TCP/IP.

11. The transport layer protocols used for DNS, WWW, VoIp and FTP respectively are:
    (A) UDP, TCP, TCP and UDP
    (B) TCP, UDP, UDP and TCP
    (C) TCP, UDP, TCP and UDP
    (D) UDP, TCP, UDP and TCP

12. In Ethernet when Manchester encoding is used, the baud rate is
    (A) Same as the bit rate (B) Half the bit rate
    (C) Twice the bit rate (D) None of these

13. Which one of the following is not a session layer protocol?
    (A) ADSP (B) L2TP
    (C) SDP (D) AFP

14. What is the maximum sending window size for data transmission using Go-Back *N* protocol with 8-bit frame sequence number?
    (A) 255 (B) 128
    (C) 8 (D) 256

15. A message is send from host *A* to host *B* using public key encryption mechanism. Which one of the following is true about the keys used at encryption and decryption?
    (A) Encryption: *A*'s private key and *B*'s private key
    Decryption: *A*'s public key and *B*'s public key
    (B) Encryption: *A*'s private key and *B*'s public key
    Decryption: *B*'s private key and *A*'s public key
    (C) Encryption: *A*'s public key and *B*'s private key
    Decryption: *A*'s private key and *B*'s public key
    (D) Encryption: *A*'s public key and *B*'s public key
    Decryption: *A*'s private key and *B*'s private key

16. Using 64 byte packets host *A* sends messages to host *B* (protocol is sliding window protocol). The round trip delay between *A* and *B* is 60 milliseconds and the bottleneck bandwidth on the path between *A* and *B* is 128 kbps. What is the optimal window size that *A* should use?

(A) 40 (B) 30
(C) 15 (D) 32

17. Consider a broadcast LAN of 8 km long, having a bandwidth of 10^7 bps. It uses CSMA/CD and the signal travels along the wire at 4×10^8 m/s. What is the minimum packet size that can be used on this network?

(A) 25 bytes (B) 400 bytes
(C) 50 bytes (D) 200 bytes

18. A company having a class *B* address has to be splitted into subnets with 5-bit subnet number. Find the maximum number of subnets and the maximum number of hosts in each subnet?

(A) Subnets: 32 and Hosts: 2046
(B) Subnets: 30 and Hosts: 2048
(C) Subnets: 32 and Hosts: 2048
(D) Subnets: 30 and Hosts: 2046

19. Consider a host system on a 20 Mbps network regulated by a token bucket. The arrival rate of token bucket is 4 Mbps. The token bucket is initially filled with 32 Megabits. Find the maximum duration for which the computer can transmit at the full 20 Mbps?

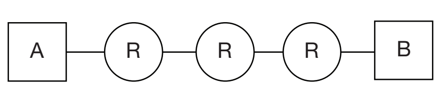
(A) 4 seconds (B) 1.5 seconds
(C) 1 seconds (D) 2 seconds

20. Match the following:

I.	Network Layer	1.	Hub
II.	Data Link Layer	2.	Switches
III.	Physical Layer	3.	Bridges
		4.	Routers
		5.	Repeater

(A) I–4, II–2 and 3, III–1 and 5
(B) I–3 and 4, II–1 and 2, III–5
(C) I–1 and 4, II–2 and 3, III–5
(D) I–4, II–1, 2 and 3, III–5

21. Consider 2 computers *A* and *B* connected through three intermediate routers (*R*) as shown in the figure



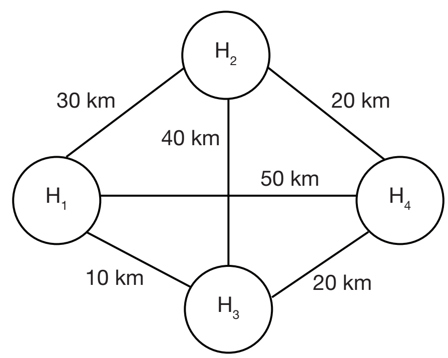
Determine how many times each packet has to visit the network layer and the data link layer during a transmission from *A* to *B*?

(A) Network layer – 8 times and
Data link layer – 8 times
(B) Network layer – 2 times and
Data link layer – 8 times
(C) Network layer– 5 times and
Data link layer – 8 times
(D) Network layer – 6 times and
Data link layer – 5 times

22. Consider an instance of TCP's Additive Increase Multiplicative Decrease (AIMD) algorithm where the size at the start of the slow start phase is 2 MSS and the threshold at the start of the first transmission is 8 MSS. Assume that a time-out occurs during 5^{th} transmission. Find the congestion window size at the end of the 8^{th} transmission?

(A) 6 MSS (B) 5 MSS
(C) 12 MSS (D) 10 MSS

23. Consider a network that consists of 4 hosts distributed as shown in the figure. Assume that the network uses CSMA/CD and signal travels at 4×10^5 km/sec. If the sender sends at 1 Mbps, what could be the minimum size of packet?



(A) 2500 bits (B) 250 bits
(C) 500 bits (D) 5000 bits

Linked Answer Questions 24 and 25

Consider three nodes *P*, *Q*, *R* connected in series. Node *P* is connected to Node *Q* via 2 Gbps link, 400 km length. Node *Q* is connected to Node *R* via 80 Mbps link, 20 km length. The links are full duplex. *A* large file is to be sent from node *P* to node *R*. The packets are 2048 bytes, and the velocity of propagation is 2×10^8 m/sec.

24. What is the round trip time?

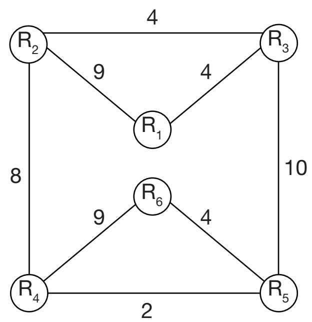
(A) 3.62 m sec
(B) 6.48 m sec
(C) 5.44 m sec
(D) 4.42 m sec

25. Find the optimal value of sender's window using end to end sliding window protocol?

(A) 24 packets (B) 26 packets
(C) 21 packets (D) 27 packets

Linked Answer Questions 26 and 27

Consider a network with six routers R_1 to R_6 connected with links having weights as shown in the following diagram



26. All the routers use the distance vector based routing algorithm to update their routing tables. Each router starts with its routing table initialized to contain an entry for each neighbour with the weight of the respective connecting link. After all the routing tables stabilize, how many links in the network will never be used for carrying any data?

(A) 2 (B) 3
(C) 1 (D) 4

27. The weight of all the unused links are changed to 2 and the distance vector algorithm is used again until all routing tables stabilize. How many links will now remain unused?

(A) 3 (B) 2
(C) 1 (D) 0

28. Two computers *X* and *Y* have IP addresses 20.126.5.109 and 20.126.5.80 respectively and they both use the same network mask *N*. Which of the following values of *N* given below should not be used if *A* and *B* should belong to the same network?

(A) 255.255.0.0 (B) 255.255.255.45
(C) 255.255.255.0 (D) 255.255.255.64

29. What will be the maximum number of hosts per subnet on a class A network with subnet mask of 255.255.224.0?

(A) 8192 (B) 4096
(C) 4094 (D) 8190

30. Which one of the following is true about adaptive or dynamic directory used in packet routing?

(A) Changes with each user session
(B) Changes within each user session
(C) Changes at system generation time only
(D) Both (A) and (B)

31. Choose the correct statement from the following statements?

(A) Initial setup is required for connectionless service
(B) Packet sequencing is not guaranteed in connection–oriented service
(C) In connection–oriented service, the destination address is to be specified only during the setup
(D) Initial setup is possible in connectionless service

32. Which one of the following statement is true about ICI (Interface Control Information)?

(A) It is a combination of Service Data Unit (SDU) and Protocol Control Information (PCI)
(B) It is a temporary parameter passed between *N* and *N* – 1 layers to involve service functions between two layers
(C) It is used to transfer user data from layer to layer
(D) It is used to exchange information by peer entities at different sites on the network to instruct an entity to perform a service function

33. Which one of the following statements is not correct?

(A) PGP encrypts data by using a block cipher MD5
(B) Masquerade is an active attack
(C) DES algorithm is vulnerable to Brute Force attack
(D) The key size of Triple DES can be 56 bits or 112 bits or 168 bits

34. Which one of the following statement is true?

(A) RIP is a distance vector routing protocol and OSPF is a link state routing protocol
(B) OSPF is a distance vector routing protocol and RIP is a link state routing protocol
(C) Both RIP and OSPF are distance vector routing protocols
(D) Both RIP and OSPF are link state routing protocols

35. Consider the path R_1–R_2–R_3–R_4, where R_1, R_2, R_3, R_4 are routers. The maximum bandwidth of each router, R_1 to R_4 are 600 Kbps, 500 Kbps, 800 Kbps and 400 Kbps respectively. What is the effective bandwidth if no buffering is possible?

(A) 800 Kbps
(B) 575 Kbps
(C) 400 Kbps
(D) 2300 Kbps

Answer Keys

Hints and Explanations

4. $\dfrac{8400}{8+2} = 840$ Choice (D)

5. $4 \times 1200 + n \times 600 = 9600$

$\Rightarrow \quad n \times 600 = 9600 - 4800$

$\Rightarrow \quad n = \dfrac{4800}{600} = 8$ Choice (D)

12. Baud rate = 2 ∗ Bit rate Choice (C)

14. Sending window Size of Go Back = $2^n - 1$

$= 2^8 - 1 = 255$ Choice (A)

16. Window size $= \dfrac{R \times t}{\text{Packet size}}$

$= \dfrac{128 \times 10^3 \times 60 \times 10^{-3}}{64 \times 8} = 15$ Choice (C)

17. Minimum frame size = 2 × z × band width Minimum packet size

$= 2 \times \dfrac{8 \times 10^3}{4 \times 10^8} \times 10^7 = 400$ bits

In bytes, $\dfrac{400}{8} = 50$ bytes Choice (C)

18. Maximum number of subnets

$= 2^5 - 2 = 30$

Maximum number of hosts in each subnet

$= 2^{(16-5)} - 2 = 2^{11} - 2 = 2046$ Choice (D)

19. Data Arrival rate = 4 Mbps

Data transfer rate = 20 Mbps

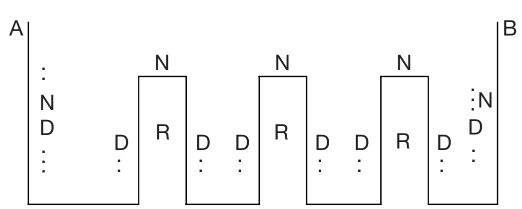
Initial capacity = 32 Mb

Net data rate = 20 – 4 = 16 Mbps

$\therefore$ Maximum duration $= \dfrac{32\text{ Mb}}{16\text{ Mbps}} = 2\,\text{sec}$

Choice (D)

21.



Choice (C)

22. Initial Threshold = 8 MSS

window size for: 1st transmission: 2 MSS

2nd transmission: 4 MSS

3rd transmission: 8 MSS

Threshold Reached, so increase linearly (according to AIMD):

4th transmission: 9 MSS

5th transmission: 10 MSS

Time out at 5th transmission:

New threshold $= \dfrac{10}{2} = 5$ MSS

6th transmission = 2 MSS

7th transmission = 4 MSS

Threshold reached (5 MSS)

8th transmission = 5 MSS Choice (B)

23. Minimum frame size = Transmission delay = RTT

Maximum distance between any 2 hosts = 50 km (between H_1 & H_4)

$\text{RTT} = \dfrac{(2 \times 50)}{4 \times 10^5} = 250\,\mu\,\text{sec}$

$\dfrac{L}{B} = \text{RTT}$, where B = 1 Mbps = 1×10^6 bps

$\therefore \quad L = \text{RTT} \times B$

$= 250 \times 10^{-6} \times 1 \times 10^6 = 250$ bits Choice (B)

24. RTT = Transmission delay + 2 × propagation Delay

Transmission delay $= \dfrac{\text{Number of bits}}{\text{Rate of transmission}}$

Propagation delay $= 2 \times \dfrac{\text{distance}}{\text{speed}}$

$= 2 \times \left(\dfrac{400 \times 10^3}{2 \times 10^8} + \dfrac{20 \times 10^3}{2 \times 10^8} \right)$

RTT = 4.42 m sec Choice (D)

25. Minimum bandwidth between P & R is 80 Mbps

Maximum end to end bandwidth = 80 Mbps

RTT = 4.42 m sec

Maximum bytes that can be transferred with in RTT

= 80 Mbps × 4.42 m sec

= 353600 bits = 44200 bytes

Number of packets $= \dfrac{44200}{2048} = 21$ packets Choice (C)

26. Shortest distances from R_1 to R_2, R_3, R_4, R_5, R_6

R_1(8, 4, 16, 14, 18)

The links used are R_1–R_3, R_3–R_2, R_2–R_4, R_3–R_5, R_5–R_6

R_2(4, 8, 10, 14)

The links used are R_2–R_3, R_2–R_4, R_4–R_5, R_5–R_6

R_3(12, 10, 14)

The links used are R_3–R_2, R_2–R_4, R_3–R_5, R_5–R_6

R_4(2, 6)

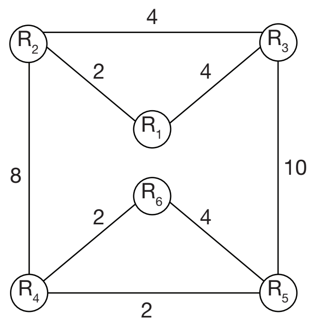
The links used are R_4–R_5, R_5–R_6

R_5(4)

The link used is R_5–R_6

$\therefore$ Unused links are R_1–R_2, R_4–R_6. Choice (A)

27. The network is shown below:



R_1 (2, 4, 10, 12, 12)

The links used are R_1–R_2, R_1–R_3, R_2–R_4, R_4–R_6, R_4–R_5

R_2 (4, 8, 10, 10)

The links used are R_1–R_3, R_2–R_4, R_4–R_5, R_4–R_6

R_3 (12, 10, 14)

The links used are R_3–R_2, R_2–R_4, R_3–R_5, R_4–R_6

R_4 (2, 2)

The links used are R_4–R_5, R_4–R_6

R_5 (4)

The links used are R_5–R_4, R_4–R_6

$\therefore$ Unused link is R_5–R_6 Choice (C)

28. IP of A = 20.126.5.109

$\downarrow$

01101101

IP of B = 20.126.5.80

$\downarrow$

01010000

perform AND operation between each mask with both the IP's of A and B. If the resultants are same then both belong to same network. Choice (B)

29. 224 – 11100000

Number of host bits = 32 – (8 + 8 + 3) = 13

$\therefore$ Total number of hosts per subnet = $2^{13} - 2$

= 8190 Choice (D)

35. As there is no buffering, the smallest bandwidth is the determining factor. Choice (C)

Computer Networks Test 3

Number of Questions: 25 **Section Marks: 30**

Directions for questions 1 to 25: Select the correct alternative from the given choices.

1. Which of the following layers of ISO/OSI model implements ARP (address Resolution protocol)?
(A) Data link layer (B) Network layer
(C) Transport layer (D) Application layer

2. Which of the following routing has more chances for getting TTL as zero?
(A) Source routing
(B) Router routing with default route
(C) Router routing with dynamic default route
(D) Routing will not affect the value of TTL

3. Which of these protocols doesnot accept the out of order packets?
(I) Go back N (II) selective repeat
(A) Only (I) (B) Only (II)
(C) Both (I) and (II) (D) None of the above

4. Which of the following is not the functionality of presentation layer?
(A) translation
(B) encryption
(C) compression
(D) synchronizes the interaction between the two parties

5. In 802.3 LAN the Bandwidth of the cable is 5 Mbps, velocity of propagation is 2.1×10^8 m/s, length of LAN is 2.1 km, what is the minimum packet size?
(A) 100 bits (B) 120 bits
(C) 210 bits (D) 115 bits

6. In 802.3 LAN the encoding technique used is:
(A) Manchester encoding
(B) defracted Manchester encoding
(C) Both (A) and (B)
(D) None of these

7. Match the following:

Column–I		Column–II	
(1)	Logical addressing	(i)	Data link layer
(2)	Physical addressing	(ii)	Network layer
(3)	Service Point addressing	(iii)	Physical Layer
		(iv)	Transport layer

(A) 1–(i), 2–(iv), 3–(iii)
(B) 1–(ii), 2–(iii), 3–(i)
(C) 1–(iii), 2–(i), 3–(iv)
(D) 1–(ii), 2–(i), 3–(iv)

8. CHECKSUM calculations for a packet is done by:
(A) data link layer (B) network layer
(C) transport layer (D) physical layer

9. Match the following:
(A) Dividing the transmitted bit stream into frames
(B) Determining which route the subnet has to use
(C) Fragment the incoming byte stream into discrete messages.
I. TRANSPORT LAYER
II. DATA LINK LAYER
III. NETWORK LAYER
(A) I–A, II–C, III–B (B) I–C, II–A, III–B
(C) I–A, II–B, III–C (D) I–B, II–C, III–A

10. Which of the following situations would not cause packet retransmission?
(A) when packet TTL becomes zero
(B) when there is congestion at the link
(C) when the buffer is full at the router
(D) None of the above

11. Consider a link with 10 Mbps bandwidth and 16 m sec round trip time, if frame size is 1 K bytes then how much percentage of link capacity is utilized?
(A) 9.5 (B) 7.8
(C) 5 (D) 12

12. What will be the length of the packet if the senders utilization is 50%, Band width of the link is 10 Mbps and the Round trip time is 4 msec?
(A) 40 KB (B) 8 KB
(C) 6 KB (D) 5 KB

13. What is the size of sender’s window for stop wand wait, Go-back N and selective repeat, when the available sequence numbers are 8.
(A) 1, 7 , 4 (B) 8, 8, 8
(C) 4, 4, 4 (D) 2, 4, 8

14. Host A sends 64 byte packets using sliding window protocol to host B. The round trip delay between A and B is 160 m sec Bandwidth of the link is 256 Kbps what will be the optimal window size that A should use:
(A) 40 (B) 80
(C) 120 (D) 160

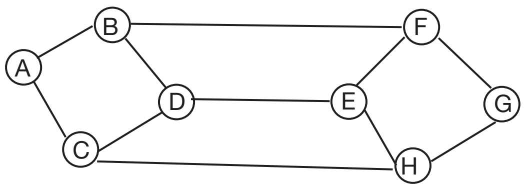
15. A computer on a 20 Mbps network is regulated by a token bucket algorithm, the token bucket is filled at a rate of 2 Mbps and it is initially filled with a capacity of 16 Mbps. The duration for which the computer can transmit, at the maximum regulated output rate (in seconds) is ________.
(A) 1.98 sec (B) 0.89 sec
(C) 2.5 sec (D) 3.0 sec

16. The message 100011001 is to be transmitted using the CRC polynomial $x^3 + x^2 + 1$ the message that should be transmitted is:
(A) 1000110010000 (B) 1000110010100
(C) 1000110011001 (D) 1000110011000

17. In 802.3, A and B are the only two stations each has a steady queue of frames to send, both A and B attempt to transmit a frame, collide and A wins the first back off race. At the end of this successful transmission by A both A and B attempt to transmit, collide and A again wins the back off race, at the end of this successful transmission by A, both A and B attempt to transmit, collide and A again wins the back off race. At the end of this successful transmission by A, both the stations attempt to transmit and collide. The probability that B wins the first back off race is:

(A) 0.625 (B) 0.0625
(C) 0.75 (D) 0.075

18. Consider the following figure:



For the above network, ignore the line weights, suppose flooding is used for the routing algorithm. If a packet is sent from 'D' to 'G', with a maximum hop count of 3, list all the routes it take and how many packets are sent in this flooding?

(A) 5 Routes, 11 packets
(B) 4 Routes, 11 packets
(C) 4 Routes, 3 packets
(D) 5 Routes, 5 packets

19. A network system with n-layers, Application generated message of length m-bytes. If each layer adds an h-byte header what fraction of network Bandwidth is filled with headers?

(A) $h/(n \times m)$ bytes
(B) $h \times n \times m$ bytes
(C) $(n \times h)/m$ bytes
(D) $m/(n \times h)$ bytes

20. Consider the following bit stream '0111101011111011110111' using bit stuffing framing method in the data link layer, how many 0s should be stuffed in the data using a flag pattern of '011110'?

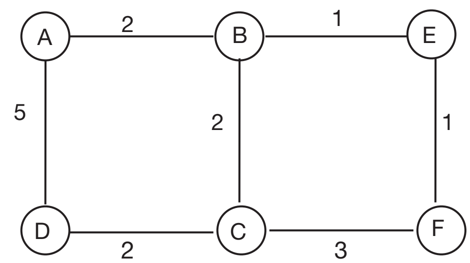
(A) 3 (B) 4
(C) 5 (D) 6

21. Match the following:

(a)	Distance vector routing	(I)	BGP
(b)	Link state routing	(II)	RIP
(c)	Path vector protocol	(III)	OSPF

(A) a–III, b–II, c–I
(B) a–II, b–III, c–I
(C) a–I, b–II, c–III
(D) a–I, b–II, c–III

22. Consider network:



At $t = 0$, the distance vector is

Information stored	Distance to reach node					
	A	B	C	D	E	F
A	0	2	∞	5	∞	∞
B	2	0	2	∞	1	∞
C	∞	2	0	2	∞	3
D	5	∞	2	0	∞	∞
E	0	1	∞	∞	0	3
F	∞	∞	3	∞	3	0

What would be the distance vector in next cycle?

(A)

Information stored at node	Distance to reach nodes					
	A	B	C	D	E	F
A	0	2	4	5	3	∞
B	2	0	2	4	1	2
C	4	2	0	2	3	3
D	5	4	2	0	∞	5
E	3	1	3	∞	0	3
F	∞	2	3	5	3	0

(B)

Information stored at node	Distance to reach node					
	A	B	C	D	E	F
A	0	2	4	5	3	∞
B	2	0	2	4	1	4
C	4	2	0	2	3	3
D	5	4	2	0	∞	5
E	3	1	3	∞	0	3
F	∞	2	3	5	3	0

(C)

Information stored at node	Distance to reach node					
	A	B	C	D	E	F
A	0	2	4	1	3	∞
B	2	0	2	4	1	2
C	4	2	0	2	3	3

D	5	1	2	0	∞	5
E	3	1	3	∞	0	3
F	∞	4	3	5	3	0

(D)

Information stored at node	Distance to reach node					
	A	**B**	**C**	**D**	**E**	**F**
A	∞	2	4	5	3	∞
B	2	0	2	4	1	4
C	4	2	0	2	3	3
D	5	4	2	0	∞	5
E	3	1	3	∞	0	3
F	∞	4	3	5	3	0

23. Which of the following statements are correct, when router malfunctions?
(i) each node computes only its own table
(ii) node can advertise incorrect link cost in link state algorithm
(iii) Each node's table is used by other in distance vector
(iv) Distance vector node can advertise in correct path cost
(A) (i) and (iii) are correct
(B) (i) and (iv) are correct
(C) (ii) and (iii) are correct
(D) All statements are correct

24. Which of the following is TRUE about routing information protocol (RIP)?
(a) RIP is based on distance vector routing
(b) RIP protocol is slow converging and instable
(c) the router forwards only the packets that have traveled the shortest path from the source to the route
(d) RIP uses Dijkstra algorithm to determine best path to a particular destination.
(A) Only (a) and (b) (B) Only (a) and (d)
(C) Only (b) and (c) (D) Only (c) and (d)

25. Which of the following is TRUE about open shortest path first protocol?
(a) OSPF is based on link state routing
(b) OSPF routing tables are calculated by using Dijkstra algorithm
(A) Only (a) is correct
(B) Only (b) correct
(C) (a) and (b) are correct
(D) (a) and (b) are false

Answer Keys

1. A	**2.** B	**3.** A	**4.** D	**5.** A	**6.** A	**7.** D	**8.** C	**9.** B	**10.** D

Hints and Explanations

1. ARP (Address Resolution Protocol) maps IP addresses to hardware addresses. It is used by Internet protocol (IP) and used in Data link layer. Choice (A)

2. TTL (Time To Leave) is a field in a IP header which avoids packet going in to infinite loop. In default route routing there are more chances for getting a packet in to an infinite loop. Choice (B)

3. In Go back–N protocol, Receiver can't receive out of order packet, if it receives it sends NAK. In selective repeat, it can receive out of order packets and sorting algorithm is used for sorting the packets at the receiver end. Choice (A)

4. The functionalities of the presentation layer is
(a) Encoding
(b) Encryption
(c) Compression Choice (D)

5. Condition for minimum packet size in Ethernet:
Transmission delay = round trip delay

i.e., $2\times\frac{L}{B} = 2\times\frac{d}{v}$

$$2\times\frac{L}{5\times10^6} = 2\times\frac{2.1\times10^3\,\text{m}}{2.1\times10^8}$$

$L = 100$ bits. Choice (A)

6. In 802.3, Manchestar encoding is used for data encoding. In this, coding data bit is either high, low or of equal time. Choice (A)

7. (1) Logical addressing is implemented in Network layer
(2) Physical addressing is implemented in data link layer
(3) Service point addressing is implemented in Transport layer. Choice (D)

8. The end to end error control in a network is done by Transport layer by using checksum. Choice (C)

9. Data Link Layer divides bit stream into frames.
One of the main functionality of Network Layer is routing.
Fragmentation is done by Transport Layer.
Choice (B)

10. The packet gets discarded
When TTL becomes zero
When there is congestion at the link
When the buffer is full at the router Choice (D)

11. Throughput $= \dfrac{1 \text{ K bytes}}{16 \text{ m sec}}$

$= \dfrac{1 \times 10^3 \times 8 \text{ bits}}{16 \times 10^{-3} \text{ sec}}$

$= \dfrac{10^6}{2} \times \text{bps}$

% of link utilization

$$= \frac{\frac{10^6}{2} \times 100}{10 \times 10^6}$$

$$= \frac{10^6}{2 \times 10 \times 10^6} \times 100 = 5\%.$$

Choice (C)

12. When senders utilization is 50% then

$L = BR$

where L = length of the packet
B = Band width of link
R = Round trip time

$\therefore$ $L = 10 \times 10^6 \times 4 \times 10^{-3}$ bits
$= 10 \times 4 \times 10^3$ bits
$= 40 \times 10^3$ bits
$= 5$ KB. Choice (D)

13. When N is the available sequence numbers, then sender's window size of stop and wait, Go-back N and selective repeat are $1, N-1, \dfrac{N}{2}$. Choice (A)

14. R.T.T $= 160 \times 10^{-3}$ sec
B.W $= 256 \times 10^3$ bps
(Band width)
Length of the packet
$= 256 \times 160 \times 10^3 \times 10^{-3}$
$= 256 \times 160$

Window size $= \dfrac{256 \times 160}{64 \times 8} = 80.$ Choice (B)

15. Capacity of the bucket (C) = 16 Mbps
Maximum regulated output rate (M) = 20 Mbps
Token filling rate $\left(\int\right)$ = 2 Mbps
Time duration for incoming bursty traffic (t) = ?

$$C + \int t = Mt$$

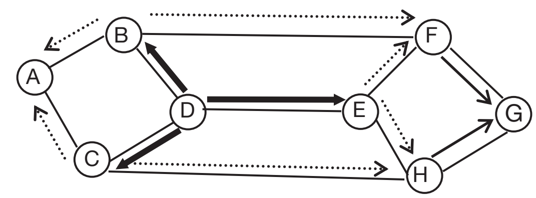
$$16 + 2t = 20t$$

$\Rightarrow$ $16 = 18t \Rightarrow t = 0.89$ seconds Choice (B)

16. Message = 100011001 divisor = 1101 and CRC remainder is 1000 the transmitted message is 1000110011000.
Choice (D)

17. A has two conditions to win first back off race (0, 1) & B has eight conditions (0, 1, 2, 3, 4, 5, 6 and 7) i.e., B has only one chance to win i.e., $\dfrac{1}{16} = 0.0625$.
Choice (B)

18. See the figure given below:



Hop 1 (→), Hop 2 (→), Hop 3 (→)
11 packets are sent in this flooding.
In Hop 1, 3 packets are sent (→)
In Hop 2, 6 packets are sent (→)
In Hop 3, 2 packets are sent (→) Choice (B)

19. Network with 'n' layers adds 'n' – h – byte headers to a packet of length 'm' then the fraction of network bandwidth filled with headers are $\left(\dfrac{n \times h}{m}\right)$ bytes.
Choice (C)

20. Data will be stuffed as
011101010111011100
↑ ↑ ↑
1110101110
↑ ↑
After every 3 consecutive 1s we will stuff '0' bit therefore total = 5. Choice (C)

21.
- Distance vector routing is implemented using RIP.
- Link state routing is implemented using OSPF.
- Path vector protocol includes BGP. Choice (B)

22. In distance vector routing, at every step shortest path are calculated to the all nodes from its neighbours.
Choice (A)

23. The functionalities in the above all statements are performed by a mal functioned router. Choice (D)

24. RIP uses the hop count for the packet routing and there is no compulsive that it should be shortest.
RIP uses Bellman–Ford algorithm for finding shortest path. Choice (A)

25. OSPF is based on link state routing.
Paths among the nodes are calculated using Dijkstra's algorithm. Choice (C)

Computer Networks Test 4

Number of Questions: 25 **Section Marks: 30**

Directions for questions 1 to 25: Select the correct alternative from the given choices.

1. Which of the following IP address belongs to class A network?
(A) 130. 140. 180. 210 (B) 127. 190. 120. 191
(C) 125. 150. 160. 189 (D) 132. 131. 139. 134

2. What will be the destination address if host A with IP address 156.180.190.16 wants to send data to all the members in network with network ID 19?
(A) 255.255.255.255 (B) 19.255.255.255
(C) 156.19.255.255 (D) 156.180.255.255

3. Which of the following work stations does not implement network layer?
(A) Switch (B) Brouter
(C) Gate way (D) Router

4. ______ layer responds when packet gets discarded due to its TTL (when TTL becomes 0)
(A) Application layer (B) Transport layer
(C) Network layer (D) Physical layer

5. Which of the following algorithm is not related to private key cryptography?
(A) DES (B) RSA
(C) AES (D) IDEA

6. What is the minimum positive integer 'p' such that 3^p mod 17 = 1?
(A) 5 (B) 8
(C) 12 (D) 16

7. X. 21 is:
(A) a method of determining which device has access to the transmission medium at any time
(B) a method for access control techniques for multiple access transmission media
(C) a very common bit oriented data link protocol
(D) a network access standard for connecting stations to a circuit switched networks

8. The network topology that supports bi-directional links between each possible node is:
(A) ring (B) star
(C) tree (D) mesh

9. Match the following:

Column–I		Column–II	
(a)	Logical addressing system	(i)	16 bit
(b)	Physical addressing system	(ii)	32 bit
(c)	Port addressing system	(iii)	48 bit

(A) a–(i) b–(ii) c–(iii) (B) a–(ii), b–(i), c–(iii)
(C) a–(ii), b–(iii), c–(i) (D) a–(iii), b–(i), c–(ii)

10. In TCP the flags syn = 0 and ack = 1 indicates:
(A) open connection packet
(B) open connection ack
(C) data packet
(D) reply packet

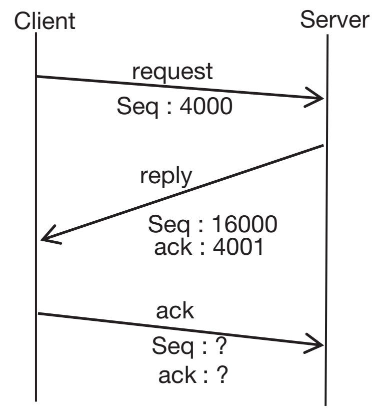
11. A user 'A' got an email containing multi media (requires high band width) if the band width is limited then:
(A) user can open the mail using SMTP
(B) user can download the message using the POP3
(C) user can partially download email using IMAP4
(D) user cannot open (or) download the email

12. MIME supports
(A) Text in character sets other than ASCII
(B) Non text attachments
(C) Message bodies with multiple parts
(D) All the above

13. For a link having bandwidth 10 Mbps, calculate the time to wrap the sequence numbers of TCP? (approximate value)
(A) 3436 minutes (B) 100 seconds
(C) 57 minutes (D) 10 minutes

14. Sender's window size in TCP is determined by
(i) Receiver window size
(ii) Congestion window size
(A) Both (i) and (ii)
(B) Only (i)
(C) Only (ii)
(D) None of the above

15. Consider the connection establishment in TCP using 3 way handshaking



What will be the values of sequence number (seq) and ack for the last hand shake?
(A) seq = arbitrary number ack = 16001
(B) seq = 4000 ack = arbitrary number
(C) seq = 4000 ack = 16001
(D) seq = 4001 ack = 16002

16. Which of the following can be used for only source IP in a packet header?
(A) 10.1.1.1 (B) 0.0.0.0
(C) 0.1.1.1 (D) 127.1.1.1

17. If WAN link is 2 Mbps and round trip time between source and destination is 300 m sec, what would be the optional TCP window size needed to fully utilize the line?
(A) 60,000 bits (B) 75,000 bytes
(C) 75,000 bits (D) 60,000 bytes

18. Device *A* IP address is 172.16.17.30/20 Device *B* IP address is 172.16.28.15/20, which one of the following statement is correct?
(A) Both devices are in the same subnet
(B) Devices are in different subnets
(C) Variable length subnet mask is used in the network
(D) Insufficient data

19. If the IP address is 130.45.34.56 and subnet mask is 255.255.240.0, then what is the subnet address?
(A) 130.45.0.0 (B) 130.45.34.0
(C) 130.45.32.0 (D) 130.45.32.56

20. If the IP address is 196.196.64.170 and subset mask is 255.255.255.240, what is the broadcasting address to the subnet?
(A) 196.196.64.255 (B) 255.255.255.255
(C) 196.196.240.170 (D) 196.196.64.175

21. Consider the following Networks 206.82.2.0, 206.82.3.0, 206.82.4.0 and 206.82.5.0; the Super net mask will be:
(A) 255.255.252.0 (B) 255.255.244.0
(C) 255.255.255.82 (D) 206.82.1.0/22

22. Consider the sub net mask of IP address 255.0.0.0 to which class of IP address this super net mask belongs to?
(A) class A (B) class B
(C) class C (D) None of these

Linked Answer Questions 23 and 24:
RSA algorithm is used by choosing two prime number $p = 3, q = 11$.

23. What are the encryption and decryption keys?
(A) 3, 7 (B) 2, 6
(C) 5, 7 (D) 8, 12

24. What will be the encrypted message for GATE (if $A = 1$, $B = 2$)?
(A) 1311426 (B) 2416513
(C) 10134261 (D) 1421331

25. Which of the following is TRUE for authentication and key management among two parties?
(A) 3 hand shake is necessary for the authentication with each handshake done with private key cryptography
(B) 3 handshake is necessary for the authentication and key management with each hand shake, done with public key cryptography
(C) 3 hand shake is necessary for the authentication and key management with 2 hand shakes one with public key cryptography and one with private key cryptography
(D) 3 hand shake is necessary for the authentication and key management with handshake as public key cryptography and 2 handshakes as private key cryptography

Answer Keys

1. C	**2.** B	**3.** A	**4.** C	**5.** B	**6.** D	**7.** D	**8.** D	**9.** C	**10.** C
11. C	**12.** D	**13.** C	**14.** A	**15.** C	**16.** B	**17.** B	**18.** A	**19.** C	**20.** D
21. B	**22.** B	**23.** A	**24.** A	**25.** C					

Hints and Explanations

1. Class *A* IP address range is 1–126 is in the first octet. In the given options, option (C) has the 125 in the first octet. So, 125.150.160, belongs to class *A* network. Choice (C)

2. Direct Broadcasting address for the network ID 19 will be 19.255.255.255. Direct Broadcasting address in the same network is 255.255.255.255. Choice (B)

3. Switch has only two layers, i.e. Physical layer and data link layer. Choice (A)

4. When packet gets discarded with TTL = 0, then the network layer sends the message to source, so that it can choose another route. Choice (C)

5. RSA is public key cryptography. Choice (B)

6. 3^{16} mod 17 = 1. Choice (D)

7. X.21 is a network access standard for connecting stations to a circuit switched networks. Choice (D)

8. In mesh topology, each node is connected to the other nodes with a link, so in Mesh topology it support bidirectional links. Mostly, Mesh topology is used in Internet. Choice (D)

9. Logical addressing system (IP address) takes a 32-bits.
Physical addressing system takes 48-bits.
Part addressing system takes 16-bits.
Choice (C)

10. When SYN = 0 and ACK = 1, it indicates the data packet in TCP. Choice (C)

11. User can download partially using IMAP4 protocol, when the network bandwidth is low. Choice (C)

12. MIME is used for the message having Multimedia objects. Choice (D)

13. TCP uses 32-bit sequence number, we have 2^{32} distinct numbers

Warp around time

$$= \frac{2^{32} \times 8}{10 \times 10^6}$$

= 57 minutes (approximately)

Choice (C)

14. Sender's window size is determined by using Receiver window size and congestion window size. Choice (A)

15. As the cluent received reply with sequence number 16000, it sends the ACK with sequence number 16001 and as it is not sending any data packet it sends with same sequence number.

i.e. sent in request i.e. 4000. Choice (C)

16. 0.0.0.0 Address can be used as only source address in DHCP. Choice (B)

17. In one sec we can send 2×10^6 bits

In 300×10^{-3} sec we can send

$= 300 \times 10^{-3} \times 2 \times 10^6$ bits

$= 600 \times 10^3$ bits

= 6,00,000 bits (or) 75000 bytes.

Choice (B)

18. Subnet mask for devices will be 255.255.240.0 as it has borrowed 4 bits from host ID, if AND operation is performed between subnet mask and IP address, then the result for both will be 172.16.16.0. Choice (A)

19. If we perform AND operation between IP and mask we will get subnetwork address

IP = 10000010.00101101.0010000.00111000

Subnet mask

11111111.11111111.11110000.00000000

130 . 45 . 32 .0. Choice (C)

20. Subnet mask = 255.255.255.240

11111111.11111111.11111111.11110000

IP = 196.196.64.10101010

From the above we can identify that if IP belongs to the subnet whose id is 160 with host as 10

The broadcast address will be196.196.64.175.

Choice (D)

21. the IP addresses are:

206.82.00000010.0

206.82.0000000.11.0

206.82.00000100.0

206.82.00000101.0

The super net mask is 255.255.244.0 Choice (B)

22. 255.0.0.0 can be a subnet for class *A*, supernet for class *B* and class *C*. Choice (B)

23. (A) $p = 3$ $q = 11$

$n = p \times q = 33$

$z = (p - 1)(q - 1) = 20$

$\gcd(d, z) = 1$

$\gcd(d, 20) = 1$

$\therefore \quad d = 7$

$(e \times 7) \bmod 20 = 1$

$\therefore \quad e = 3.$ Choice (A)

24. G A T E

7 1 20 5

Encrypted message

$= 7^3 \bmod 33 = 13$

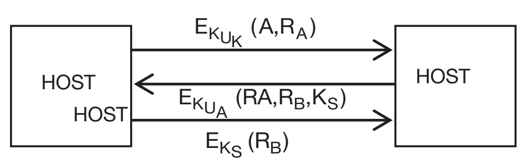
$1^3 \bmod 33 = 1$

$20^3 \bmod 33 = 14$

$5^3 \bmod 33 = 26$

Message is = 1311426. Choice (A)

25. $E_{k_{uB}}(A, R_A)$



R_A = random number generated by *A*

R_B = random number generated by *B*

K_S = session key

The first two handshakes are public key cryptography and last one is private key cryptography. Choice (C)

Chapter 1

Markup Languages

LEARNING OBJECTIVES

- *HTML*
- *Structure of an HTML document*
- *Tags*
- *Attributes*
- *External linking*
- *Hyperlinks*
- *Breaks*
- *Tables*
- *Images and color*
- *Frames*
- *CSS*
- *XML*

HyperText Markup Language (HTML)

HyperText markup language is a specialized markup language to create a web page. The language consists of ordinary text and special commands called tags.

HTML is not a formatting language. Rather it defines the parts of a document such as titles, headings, body text and block quotations. These parts are called elements. To define an element, tags are used. Tags give the browsers what they want to display on the web page.

Structure of an HTML Document

All HTML documents follow the same structure—a head which contains control information used by the browser and server and a body.

The body contains the content that displays on the screen and tags which control how that content is formatted by the browser.

```
<html>
    <head>
        <title> HTML document </title>
        </head>
        <body>
<h1> Largest heading </h1>
<p> A sample paragraph </p>
<hr>
</body>
</html>
```

- The entire document is surrounded by <html> ……. </html> which tell the software that it is now processing HTML.
- Format of our content should be according to the W3C recommendations.
- <head>……</head> and <body>…..</body> tags are compulsory in all HTML documents.
- Programming languages include a mechanism called the comment that lets developers write plain text inside their code files. Comment tags start <! ……….>. Each comment can contain as many lines of text as you like.
- If the comment runs over a number of lines, each must start and end with **- -** and must not contain **- -** within its body.

Example: <! ……..- -
- - ……. - -
- -……. - - >

Comments can be placed in either the head or body of the document.

Tags

Tags are instructions in HTML that are embedded directly into the text of an HTML document. Tags, their attributes and values are enclosed between angular brackets '<' '>'. Tags that come in pairs have a start tag and an end tag. The slash mark is used to denote the end tag. All the text with in the start tag and end tag is to be considered part of the element that the tag defines.

Tags are of two types—empty tag and container tag.

A formatted text document is composed of a set of elements such as paragraphs, headings and lists.

- A tag is a format name surrounded by angle brackets, end tags which switch a format off also contain a forward slash.
- Tags are delimited by angled brackets <h1>.

- Tags are not case sensitive. The following tags are equivalent:
  <HEAD>, <head> and <hEad>
- Styles must be switched off by an end tag.
- Some characters have to be replaced in the text by escape sequences if '<' was not escaped, the software would attempt to process anything that followed it as part of a tag.
- White space, tabs and new lines are ignored by the browser; they can be used to make the HTML source more readable without affecting the way the page is displayed.
- Multiple white spaces are replaced by a single space while new lines and tabs are treated as spaces.
- If a browser doesn't understand a tag it will ignore it.

Container tags

Tags specified in pairs, delimiting text that will have some type of formatting is called a container tag. A container along with a companion tag, encloses the text to be formatted. The effect of a container tag is applied only to the text they contain. A container tag is also called a paired tag since they always appear as a pair. The general form of a container tag can be represented as:

<tag>
Text to be formatted
</tag>

The '<tag>' is often called the opening tag and the '</tag>' is called the closing tag. The closing tag will always have a slash '/' to indicate the end of a tag. The opening tag activates the effect and the closing tag turns the effect off.

Example: <B> text </B>; the text will appear bold in the browser.

Empty tag

An empty tag is a single tag representing some formatting commands in HTML. It will not have a companion tag and are hence called stand alone or singular tag.

Example:
The tag will insert a line break at the specified position.

Attributes

HTML tags sometimes require additional information to be supplied to them. The additional information supplied to an HTML tag is known as attributes of a tag. Attributes are written immediately following the tag, separated by a space. Multiple attributes can be associated with a tag, also separated by a space.

Example: <FONT Face = "Arial" size = 12>
Welcome </FONT>
The face and size are attributes of the FONT tag.

- The document body encloses all the page formatting commands. The tags used to indicate the start and end of the main body of textual information are <BODY> and </BODY>. Page defaults like background colour, text colour, font size, etc. can be specified as attributes of the <BODY> tag.

Attributes of BODY tag

Attributes	Descriptions
Bg colour	Changes the default background colour to the colour specified with this tag. The colour can be specified by name or equivalent hexa decimal number. Example: Bg colour = RED
Text	Changes the body text colour from its default value to the colour specified with this attribute. Example: text = green
Background	Specifies the name of the 'GIF' file that will be used as the back ground of the document. This tiles up across the page to give a back ground. Background = "br. gif"

Text formatting tags

Tags	Descriptions
<P>	Paragraph break: The browser, moves onto a new line skipping one line between the previous line and the new line.
 	A line break is required when the text needs to start from a new line and not continues on the same line. It is an empty tag used to simply instruct the browser to start displaying the remaining text in a new line.
<CENTER>	Center tags are used to centre not only text but anything found between them, like texts, lists, rules, tables, etc.

HR element attributes

The HR element has no ending tag.

- **ALIGN:**
  ALIGN = "_____", sets the alignment of the line on the page to LEFT, RIGHT or CENTER
  The default is CENTER.
  The alignment has no purpose if the line width is 100%.
- **SIZE:**
  Sets the thickness or size of the line in pixels.
- **WIDTH:**
  Sets the width of the line across the page as a % (or) in pixels.

Linking

Links are elements in a web page which can be selected by clicking on it. Linking is one of the most important features of HTML. Link allows to connect a text or an image to another web page or section of a web page. A link will

be displayed in a special way in a browser. Links will be highlighted with colours or underlines to indicate that it is a hyperlink. The target of a hyperlink can be another web page, another location on the current page, an image or any other computer file available in the server. Links can be classified into two:

1. External links
2. Internal links

External linking

External linking refers to linking two documents. When a link in a web page is clicked a new document to which the hyperlink is linked will be opened. An external link points to another HTML document located anywhere in the www.

Internal linking

Internal linking refers to linking different sections of the same document. When a link is clicked a different section in the same document will be displayed in the browser window.

Text

The text on an HTML page can be altered in many ways. The actual font used can be changed to attempt to force the browser to use a specific font and the look of the text can be changed for emphasis.

- <base font size = "n">
  We can specify the minimum font size for basic text but not for headings. The size argument takes an integer from 1 to 7.
- <font size = " [+/-]"color = " # rrggbb"> The colour of the text is set with the colour argument. This takes a hex value which represents the amounts of red, green and blue in the chosen colour.

Example:

```
<html>
    <head >
        <title> changing font sizes </title >
        </head>
    <body>
<h1> Font sizes </h1>
<base font size = "3">
<p> Here is some text in size 3
<p> Here is some < font size = "7" >
                Larger </font>
<font size = "+4" > t </font >
<font size = "+3" > e </font >
<font size = "+2" > x </font >
<font size = "-1" > t </font >
</base font>
</body>
</html>
```

- Other Alternates are
   ……. → Bold
  <i> …….. </i> → Italic
  <strong > ……. </Strong > used as a form of emphasis
  < tt > …… </tt> mono spaced font
  _{……} subscript
  <sup>…….. </sup > super script

Break

Forces a line break within a passage of text where a paragraph is not desirable. On complex pages it is sometimes useful to put a <br> before and after tables, lists

- To display Escape sequences we need to use the following replacement sequences which always start with an ampersand '&' and are terminated with a semicolon.
  & amp; → &
  & nbsp; → (white space)
  & It ; → <
  & gt; → >
  & quot ; → "
  & copy ; → ©

Hyperlinks

The benefit of hypertext is that it lets us create links within a document.

- Links should be used within documents where they either add to the understanding of the work or can be used to reduce download times.
- It is better to have many links to medium sized documents containing about a screenful of information rather than forcing readers to download a single massive document.
   ……
  The link tag has 3 sections:
  1. The address of the referenced document
  2. A piece of text to display as the link
  3. Closing tag
- The link text can be formatted using any of the text formatting options. Hypertext references, the 'href' part of the tag, can be
  1. links to documents or services at other internet sites
  2. links to documents within the same website
  3. links to a specific part of either the current page or another page.

Example:

 Next page Links to another page in the same directory. The browser displays 'Next page' on the screen and highlights it so that readers know it is a hyperlink

Example:

 some site links to another website. This time some sight is displayed and highlighted.

Lists

One of the most effective ways of structuring a website or its contents is to use lists. For Example, a commercial website may use pictures of its products instead of text in hyperlinks. These can be built as nested lists to provide an interesting graphical interface to the site.

HTML provides 3 types of lists:

1. Basic bulleted list
2. A numbered list
3. A definition list

Each has a different use but generally the definition list is the most flexible of the three lists.

- **Ordered and unordered lists:**
  ….
  The ordered and unordered lists are each made up of sets of list items. Elements of a list may be formatted with any of the usual text formatting tags and may be images or hyperlinks.
  The closing tag is not part of HTML.
- <ul [type = " disc"/"square"/"circle"] [compact] > ….</ul]
  The basic unordered list has a bullet in front of each list item.
  Everything between the tags must be encapsulated within … tags.
- To minimize the amount of space that a list uses, we have to add the compact attribute
- <ol [type = "1" |"a"|"A"| "I" | "i"]
- [start = "n"][compact] > ….

An ordered list has a number instead of a bullet in front of each list item. Different numbering schemes can be specified depending upon preference.

A list can number from any value that you desire. The starting value is given by the "start" attribute. All items in an ordered list must be enclosed within ….. tags

Tables

Tables have two uses:

1. Structuring pieces of information
2. Structuring the whole web page
   - Alternatively we can structure a page using frames or images.
   - A table is a grid of information such as, we might have seen in a ledger or spreadsheet.
     Unlike a table from a spreadsheet the data items in an HTML table do not need to have any kind of relationship.
   - Most browsers struggle to process complex tables. The browsers are not optimized for tables and where tables are deeply nested on a page the browser may have difficulty displaying the page.
   - Web browsers have a layout engine which arranges the pieces before the web page is displayed.

- It is more difficult if table consists images where the size attribute of the image have not been set.
- <table [align = "center "/ "left" / "right"]
  [border [= "n"]]
  [cell padding = "n"] [width = "nn%"]
  [cell spacing = "n"]> ……. </table >
- Everything between <table>…..</table> tags will be part of table.
  These attributes control the formatting of the table as a whole, not that of the items in each cell.
- Tables can be aligned on the screen.
- A table can have a border, which includes a border between the cells. If the border attribute is not set, the table has no border.
- When the border attribute is set but a valid value is not given, a single pixel wide default border is drawn "cell padding" determines how much space is there between the contents of a cell and its border in pixels. Cell spacing sets the amount of white space between cells.
  - The "Width" attribute sets the amount of the screen that the table will use.
- <th [align = "left"/ "center"/ "right"]
  [valign = "top" / " center" / "bottom"]>…. <|tr>
  Each row of the table has to be delimited by these tags. The row can be aligned horizontally and vertically within the table.
- <th [align = "left " / "center" /"right"]
  [valign = "top" | "center" / "bottom"]
  [nowrap] [colspan = "n"] [rowspan = "n"] > …. <|th>
- These are table cells which are to be used for headings.
- The contents of the cell can be aligned vertically and horizontally within their row.
- If "nowrap" is set, the contents of the cell will not be automatically wrapped as the table is formatted for the screen.
- The "colspan" and "rowspan" attributes allow individual cells to be larger than a one by one grid.
- <td [align = "left"/ "center"/ "right"]
  [valign = " top"| "center"| "bottom"] [nowrap]
  [colspan = n] [rowspan = n] > …. </td>
  These describe the basic data cell.

Table elements

1. <caption> string </caption>
   This optional element is used to provide a string which describes the contents of the table. If used it must immediately follow the table element.
   - <thead> …… </thead>
     <tfoot> …… </tfoot>
     <tbody> …… </tbody>
     The rows in a table can be grouped into one of the three divisions.

- The idea is that the browsers will be able to scroll the tbody section of the table without moving either the thead or tfoot sections.
- When long tables extend over more than one page the information in thead and tfoot can be automatically replicated on each page.
- <colgroup [span = ‘n’] [width = ‘n’]> ….. </ col group>
Columns within a table can be logically grouped together. Each group of columns can be assigned a default width which will apply to all columns.
- The span indicates the number of columns in the group.
- <col [span = “n”] [width = “n”]> …. </col>
The attributes of individual columns are set using the “col” elements. The ‘span’ and ‘width’ attributes work in the same way as the ‘colgroup’ element.

Example:

```
<html>
<head>
   <title> A table </title>
      </head>
      <body>
<h1> A small table </h1>
<table align = “center” width = “75%”
                  border = “1”>
< caption> small table </caption >
< colgroup width = “30%” span = “2”>
</colgroup>
<colgroup span = “3” > </col group>
<thead>
<tr> <td colspan = “5”> The table header
</td> </tr>
   </thead>
   <tbody>
   <tr>
<td>First  </td>
<td> Second </td>
<td> Third </td>
<td> Fourth </td>
<td> Fifth </td>
   </tr>
   <tr>
<td>First </td>
<td> Second </td>
<td> Third </td>
<td> Fourth </td>
<td> Fifth </td>
   </tr>
   </tbody>
   </t foot>
   <tr> td co|span = “5”> Table Footer </td> </tr>
   </t foot>
   </table>
   </tbody>
   </html>
```

Images and Colour

- Colour can be used in a number of places on a web page; the background can be coloured, individual elements can be altered, and links which are already coloured can have their colours adjusted.
- To change the colours of links or the page background hexadecimal values are placed in the <body> tag.

```
<body bg color = “# nnnnnn” text = “# nnnnnn”
link = “#nnnnnn” vlink = “#nnnnnn”
alink = “#nnnnnn”>
```

- The ‘Vlink’ attribute sets the colour of links visited recently, ‘a link’ the colour of a currently active link.
- The six figure hexadecimal values must be enclosed in double quotes and preceded by a hash (#).
- The colours of page elements can be altered by using the colour modifier. To change the colour of an individual heading we can use

```
<h2 color = “#a b a b a b” > Heading < /h2> and within a
table the table headers could be coloured by:
<th bgcolor = “#a b a b a b”>
```

- Images: If we want high quality, good compression and lots of colours use JPG, GIFS are more common as they tend to be smaller files and can be animated.
- <body background = “URL”> ….. </body>
- Sets the background of your page to use the given image. Images are tiled (repeated) to fill the available space by default.
- If we want to use a single image across the width of a page make it 1281 pixels wide then it cannot be tiled horizontally.

```
<img src = “URL”| “name” height = “n” width = “n” [alt
= “string”] [align = top”| “center”/ “bottom”]
usemap = “URL”]>
```

Displays an inline image, that is an image which appears in the body of the text rather than on a page of its own or in a spawned viewer program.

- The height and width of the image, in pixels tell the browser how much space to allocate to an image when displaying a page.
- Some browsers use these to shrink/stretch images to fit.
- By default any text which follows an image will be aligned alongside its bottom edge. We can alter this so that the first line of text displays alongside the centre or top of the image.
- If we want a block of text shown next to an image we must use a table. To display an image without text, make it into paragraph.

```
<p align = “center”> <img src = “/mygif.gif”
alt =” mine”> </p>
```

The ‘usemap’ attribute is used in image mapping.

1. text message
2. <img src = “filename”>

The first case uses an ordinary hypertext link but the URL should point to the image file, giving its name and type.

- In the second case we are using an image as the link to another image. This can be useful if we want to display a page of thumbnail images and allow the reader to choose which ones to view full-size. This is one way of speeding up the loading times of graphically intensive sites.
- An **image map** is a large picture which has areas that the reader can click with a mouse.
  Each clickable area provides a hypertext link. The image map has 2 parts:
  1. Image
  2. Map

```
<img src = "URL" use map = "URL">
```

It tells the browser to display the source image and to map the second URL, the image map, onto it.

```
<area shape = "circle" | "rect"| "poly" | "default"
href = "URL" Coords = "string" alt = "string">
```

creates a clickable area on an image map. The 'alt' text in this case is displayed by the browser as an indicator for the reader of where the link goes.

- If we do not supply an 'alt', our image map is invalid and may not be displayed.
- The meaning of href should be clear, it is the destination of the link. The clickable area can have one of four shapes. Each shape is defined by coordinates, pairs of integers which give locations on the image in pixels.
- The default location does not require coordinates and is used to indicate what happens if the user clicks outside of the mapped areas.
  Each image map can have only one default
- A **'rect'** has four coordinates which are paired. The first pair defines the top left corner and the second pair the bottom right corner of the area.
- A **'circle'** is defined by its centre and its radius centre is given by a pair of values and the radius by a single value. This requires just three values in the coordinate string.
- A **'polygon'** is made from a set of coordinates with the last pair listed being joined to the first to complete the shape.
  The following example shows an image map with the mapping in the same file as the image link

```
<img src = "/mappicture.gif" usemap =" # main – map"
height = 30 width = 50>
<a name = "#main – map">
<map name = "main – map">
<area shape = "rect" href = "./images/ img1.jpg"
alt = "Image one" cords =" 0,0,25,25">
<area shape = "rect"  href = "./page1.html/"
alt = "page one" coords =" 26,26,50,50">
<area shape = default href  "./page26.html"
alt = "page 26">
</map>
</a>
```

Frames

If we want to represent a complex page structure and not confident about using a table to create it, then we can use frames. Frames are part of the HTML 4 specification. When we talk about frames what we refer to is a 'frameset' which is a special type of web page.

- The frameset page contains a set of references to HTML files, each of which is displayed inside a separate frame.
- All of the pages within a frameset are displayed inside the same browser window and can actually be made to appear to be a single page.
- Frame-based sites display more than one page at the same time, they can be complex to set up.
- Frame-based page is actually made from a set of documents, each displayed in its own frame. Each sub-documents can have its own scrollbars and can be loaded, reloaded, and printed.
- The tags that are needed are

```
<frameset [cols="%, %"] [rows = "%,%"> … </frame
set>
```

  - This tag determines how the screen will be divided between the various frames we can have as many frames either vertically or horizontally as we want.
  - Each frame has to be allocated a percentage of the screen.
  - We can also nest framesets so that individual rows or columns can themselves be broken up into frames.

```
<frame [name = "name"] src = "filename"
[scrolling = "yes"| "auto"|"no"]
[frame border = "zero" | "1"]>
```

  The src attribute works like an image source or a hyperlink address. It should point to a valid HTML file or image which can be displayed within the frame
- by setting the frame border attribute to "zero" stops it being displayed.
  <a href = " source" target = "n">
- to ensure that pages display in the correct frame we need to extend the basic address tag.

Example:

```
<html>
  <head>
    <title> TIME pvt. Limited  </title>
<frameset rows = "25% , 50%">
<frame name = "A" src = " ./ company. html">
< frame name = "B" src = " ./ orders html" scrolling = "no">
</frameset>
</html>
```

Forms

Forms are used to add an element of interactivity to a website. They are used to let the reader send information back to the server but can also be used to simplify navigation on complex websites.

```
<form action = "URL" method = "post" | "get" > … </form>
```

- A form can contain virtually all other markup tags but cannot be rested within another form..
- The action attribute specifies the name and location of a CGI script that will be used to process the data.
  Data can be sent in 2 ways:
  1. post
  2. get
- We should use 'get' to retrieve information from a server and 'post' to send information to a server. The choice of approach is made by the 'method' attribute.
- 'post' is secured than 'get'.
- 'post' is capable of sending a wide variety of character sets but 'get' can only return ASCII data.
- 'post' is used to get data written in non-English languages.

```
<input type = "text"| "password"| "checkbox" "radio"| "password"| "submit"| "reset" | "button"| "image"
name = "string" [value = "string"] [checked] [size = "n"] [maxlength = "n"] [src = "URL"]
[align = "top"| "bottom" | "middle" | "left"| "right"] >
```

Following are several types of input widgets:

- **Text** creates an input device up to size characters long and is able to accept up to max length characters as input.
- If value is set, that string will be used as the default text. These fields support only a single line of text. If we want to enter larger amount of text then use a "text area".
- **Password** works exactly like text but the input is not displayed to the screen. Each character is replaced by '*'. The password is not encoded but is sent to the server as plain text.
- **Radio** creates a radio button. These are always grouped; buttons within a group should have the same name but different values.
  The CGI script differentiates them by name + value.
- **Checkbox** produces a simple checkbox. It will be returned to the server as name = on if checked at submission.
- **Submit** creates a button which displays the value attribute as its text. It is used to send the data to the server.
- **Reset** also creates a button but this one is used to clear the form.
- **Image** can be used to place a picture on the page instead of a button.
- <select name = "string"> … </select>
  It often very useful to have a list of items from which the user can choose.
  The tag encloses a set of options and, when sent to the server, the name of the particular select tag and the name of the chosen option are returned.
- <option value = "string" [selected]> … </option> the 'select' statement will have several options from which the user can choose. The values will be displayed as the user moves through the list and the chosen one retuned to the server.
- <text area name = "string" rows = "n" cols = "n"> … </text area>
  creates a free format plain text area into which the user can enter anything. The area will be sized at 'rows' by cols but will support automatic scrolling.

Example:

```
<html>
  <head>
    <title> my company < /title>
    </head>
    <body>
<h2 align = "center"> Feedback form </h2>
<hr width = "60%">
<form action = "http:// www.My company.Com / cgi – bin/
feed back.cgi"
Method = "post">
<p align = "left" > name : <input type = "text"
Max length = "32" size = "16">
<p align = "left"> Email Address:
<input type = "text" max length = "32" size = "16">
<p align = "left"> Location:
<select name = "city" size = "1">
<option value = "Hyderabad" selected>
Hyderabad
<option value = "Chennai"> chennai
<option value = "Banglore"> Banglore
<option value = "Pune"> Pune
</select>
<p> comments:
<br> <textarea name = "comments" rows = "6" cols = "40">
</text area>
<P align = "center"> <input type = "submit" name = "feed-
back" value = "submit details">
</form>
<hr width = "60%">
</body>
</html>
```

Cascading Style Sheets

One of the most important aspects of HTML is the capability to separate presentation and content. HTML does not have the facilities that are needed to cope with this diversity, but style sheets provide them.

- A style is simply a set of formatting instructions that can be applied to a piece of text.
- There are 3 mechanisms by which we can apply styles to our HTML documents:
  1. The style can be defined within the basic HTML tag.
  2. Styles can be defined in the <head> section and applied to the whole document.
  3. Styles can be defined in external files called style sheets which can then be used in any document by including the style sheet via a URL.

Styles can be cascaded. This means that formats override any, which were defined or included earlier in the document. We may include an external style sheet which redefines the h_1 tag, then write an h_1 style in the head of your page before finally redefining h_1 in the body of page. The browser will use the last of these definitions when showing the content in the following example the <h_1> tag is redefined.

```
<html>
  <head>
    <title> simple style sheet </title>
    <style>
    <! - -
    h1{
      color : black;
      border : thin groove;
      text – align : center ;
      }
    - - >
  </style>
</head>
<body>
<h1> simple style sheet </h1>
</body>
</html>
```

Rules

A style rule has 2 parts, a selector and a set of declarations. The selector is used to create a link between the rule and the HTML tag.

The declaration has 2 parts, a property and a value.

- Selectors can be placed into classes so that a tag can be formatted in a variety of ways.
- Declarations must be separated using colons and terminated using semicolons.

  Selector {property: value; property: value …}

Classes

If we want to apply a style to some paragraphs we have to use classes.

Selector: classname {property : value ; property : value }
<selector class = classname>

- In the style sheet itself the rule is slightly modified by giving the style a unique name which is appended to the selector using a dot.
- In the HTML document when we want to use a named style the tag is extended by including

  Class = and the unique name

```
h1. f {
color :# a b a b a b ;
background – color : # d 9a b 29;
font – family : "Book Antiqua", Times, Serif;
border : thin groove # 9 a b a b a;
}
<h1 class = "f" > simple heading </h1>
```

Anonymous classes

Some times we want to apply a piece of formatting to many different elements within a page but not necessarily to the entire page.

- Cascading style sheets provides a way of defining styles within reusable classes.

Example:

```
<html>
  <head>
    <title> Anonymous classes </title>
    </style>
    <! - -
      f {
        color : # a b a b a b ;
        background – color :# d9a b29;
  font – family : "Book Anitqua", Times, serif;
  border : thin groove #9ab aba;
  - ->
</style>
</head>
<body>
<h1 class = "f"> A simple Heading </h1>
<P class = "f"> Appling the style f to a paragraph of text
</P>
</body>
</html>
```

Including style sheets:

```
< link rel = "stylesheet" href = "url"
Type = "text / css" media = "screen">
```

- The href is a hyperlink to your style sheet, 'rel' tells the browser what type of link you are using.
- We have to tell the browser what type of document we are including, the type statement gives the relevant MIME type.

Extensible Markup Language (XML)

Extensible markup language (XML) is a way to apply structure to a web page. It provides a standard open format and mechanisms for structuring a document so that it can be exchanged and manipulated. Like HTML, XML uses tags to 'markup' data content. Unlike HTML, in XML you define your own tags that meet the exact needs of your document. The custom tags make data easier to organize and search. XML will not change the way your web page look, but it will change the way the documents are read and the way documents are filed and stored.

XML is a markup language. The term 'markup' is used to identify anything put within a document which either adds or provides special meaning. A mark up language is the set of rules. It declares what constitutes markup in a document and defines exactly what the markup means. It also provides a description of document layout and logical structure.

There are three types of markup:

1. Stylistic – How a document is presented.
2. Structural – How the document is to be structured.
3. Semantic – Tells about the content of the data.

In XML, the only type of markup that we are concerned with is structural.

An XML document must begin with the XML declaration statement. This statement alerts the browser or other processing tools that the document contains XML tags.

The declaration is-

<? XML version = "1.0 "?>

This is the first line of an XML document.

Tags

Tags carry the smallest unit of meaning signifying structure, format or style of the data. They are always enclosed with angular brackets, '<' and '>'. Tags are case-sensitive. This means that the tags <fruit>, <Fruit>, <FRUIT> carry different meanings and cannot be used interchangeably. All the tags must be paired so that they have a start tag and an end tag. For example, <fruit> and </fruit>.

Elements

Tags combined with data form elements. Elements are the building block of a document. An element consists of a start tag, an end tag and the content between them:

<fruit> orange is a fruit </fruit>

Attributes

An attribute gives information about an element. Attributes are embedded in the element start tag. An attribute consists of an attribute name and attribute value. The attribute name precedes its value and they are separated by an equal sign. Also the attribute value is enclosed in quotes to delimit multiple attributes in the same element.

Example: <fruit number = "6"> orange </fruit>

Document Type Definition

- Well formed XML documents are those which have tags, elements and attributes in a correct nesting structure without really providing further definitions.
- Valid XML documents are documents which follow a more formal structure.
- The main difference between well-formed XML and valid XML is the document type definition.

The document type definition (DTD) is a set of rules that define the elements that may be used and where they may be applied in relation to each other.

XML Parser

The process of taking a file and breaking it into components is called parsing.

The components are defined by a grammar, the rules of the language. Although this may be implied by the file structure rather than formally specified.

XML is not a simple data structure and cannot be handled with regular expressions for parsing. There are 4 parameters which can be used to categorize parsers:

1. Validating
2. Non-validating
3. Stream-based
4. Tree-based

Validating parser A validating parser uses both an XML file and a DTD to check that the XML adheres to the rules of the application.

If the XML breaks the rules by straying from the DTD then the parser will create an error and stop processing the files.

Non-validating parser These parsers will only use the XML document and are quite content if it is well-formed.

Stream-based parser A stream-based parser must read the entire document each time that an operation is requested and send a message to the controlling application when specific events occur.

Example: SAX

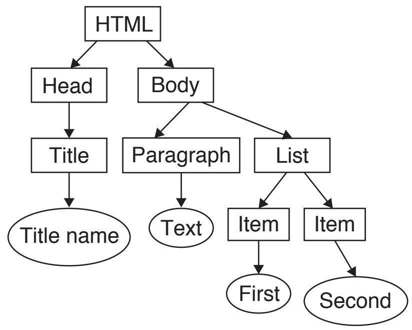
Tree-based parser This type of parser builds a static representation of the document which corresponds to the structure of the original XML.

Example: DOM

Document object model (DOM)

- The DOM is an application program interface (API) for XML documents.
- API is a set of data items and operations which can be used by developers of application programs.
- DOM API specifies the logical structure of XML documents and the ways in which they can be accessed and manipulated.
- DOM API is just a specification.
- DOM-Compliant applications include all the functionality needed to handle XML documents.
- They can build static documents, navigate and search through them, add new elements, delete elements and modify the content of existing elements
- The DOM views XML documents as trees, but this is very much a logical view of the document.
- Each node of the tree, each XML element, is modeled as an object.
- Each node encompasses both data and behavior and that the whole document can be seen as a single complex object.

- Sample DOM is shown below:



- DOM exposes the whole document to applications.

Namespaces

- A namespace is a way of keeping the names used by applications separate from each other.
- Within a particular namespace no duplicate names can exist.
- Applications may use many different namespaces at the same time.
- The implementation of namespaces is system dependent.
- XML developers can specify their own namespaces which can be used in many applications.
- A namespace can be included in the same way as a DTD.

Example:

```
<?xml version = “1.0”?>
<!DOCTYPE items SYSTEM “items.dtd “>
<!xml : namespace ns = “http : //URL/namespaces/jam”
prefix = “jam”>
<?!xml : namespace ns = “http : //URL/namespaces/bread
prefix = “bread”>
<items>
<item1>
<jam : name> kissan </jam : name>
</item1>
<item>
<bread : name> Roasted </bread : name>
</item>
</items>
```

Each item1 of items has a name element, But a namespace have been declared, so there is no chance of an application to get confused with the two names.

Attributes

- Attributes are important and useful when we are handling complexity.
- Some XML elements need to hold more than one piece of information.
- Some of these pieces are used to control the behaviour of the application. These are included as attributes.

Example:
<Quantity amount = “800” unit = “MC”> water </Quantity>
Here amount and unit are attributes of Quantity.

- The attributes of XML elements needs to be included in the DTD.
- Associated with the element declaration is an ATTLIST which may contain:
  - The name of the element
  - The name of each attribute
  - The data type of the attribute
  - Any value which will be used as a default if the attribute is omitted from the XML source.
  - Control information about the use of the element.

ATTLIST declaration

Example: <!ATTLIST Quantity amount CDATA # REQUIRED unit CDATA “g”>

The declaration shows an element with two attributes. The first one is ‘amount’, which is of CDATA type, means that it holds plain text which will not be passed through XML parser.

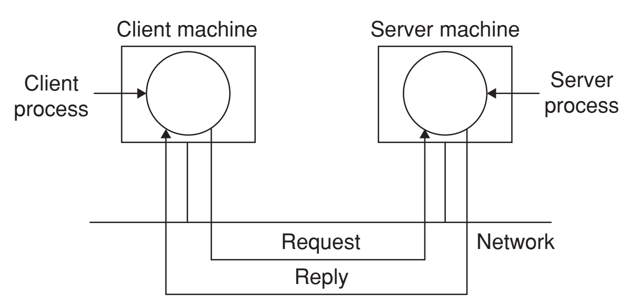
The attribute is REQUIRED which means that it must be included when the element is used. Failure of this will result in an error raised by the parser.

The second element ‘unit’ is optional which has a default value ‘g’. If the value of this attribute is omitted then default value will be used.

Client–Server Computing

Client–server networking grew when personal computers (PC’s) became the common alternative to older mainframe computers.

In client-server network, communication generally takes the form of a request message from the client to the server asking for some work to be done. The server does the work and sends back the reply, as shown below:

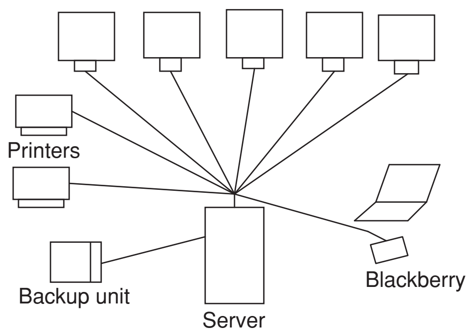


Usually, there are many clients using a small number of servers. Client devices are typically PC’s with network software applications installed, that request and receive information over the network. Mobile devices as well as desktop computers can both function as clients.

A server device typically stores files and databases including more complex applications like websites. Server devices often feature higher powered central processors, more memory and larger disk drives than clients. One server

generally supports numerous clients and multiple servers can be networked together in a pool to handle the increased processing load as the number of clients grows.

Client server network



Some of the most popular applications on the internet including email, FTP and web services follow client-server model. Each of these clients features a user interface (either graphic or text-based) and a client application that allows the user to connect to servers. In the case of email and FTP, users enter a computer name (or an IP Address) into the interface to setup connections to the server.

The client-server model was developed to allow more users to share access to database applications. Compared to the mainframe approach, client-server offers improved scalability because connections can be made as needed rather than being fixed. The client-server model also supports modular applications (software applications are divided into modules) that can make creation of software easier.

Example: Users accessing banking services from their computer uses a web browser client to send a request to a web server at a bank. That program may in turn forward the request to its own database client program that sends a request to a database server at another bank computer at bank to retrieve the account information. The balance is returned to the bank database client, which in turn serves it back to the web browser client displaying the results to the user.

Exercises

Practice Problems I

Directions for questions 1 to 15: Select the correct alternative from the given choices.

1. Which of the following statement is false?
(A) HTML is a markup language for hypertext.
(B) VML is used for freehand drawing in web page.
(C) WML is wireless markup language used for micro procure of mobiles and palmtops.
(D) None of these

2. The web browser request goes to the server in
(A) Hex form (B) ASCII form
(C) Binary form (D) Text form

3. The tag that contains information about the document including its title, scripts used, style definitions and documentation description is
(A) <HTML>, <\HTML>
(B) <HEAD>, <\HEAD>
(C) <BODY>, <\BODY>
(D) <TITLE>, <\TITLE>

4. Tag that is considered to be illegal in XML is
(A) <.document> (B) <document>
(C) <\document> (D) None of these

5. _____ specifies that a click in this area will not link anywhere.
(A) NOHREF (B) HREF = 0
(C) NULLHREF (D) HREF

6. A _______ specifies the layout for frames, including the locations and characteristics of the frame.
(A) frameset (B) border layout
(C) table (D) frame border

7. What is the correct syntax of the declaration, which defines the XML version?
(A) <xml version = "1.0"/>
(B) <?xml version = "1.0"?>
(C) <?xml version = "1.0"/>
(D) None of the above

8. Which of the following are predefined attributes?
(A) xml : lang (B) xml : space
(C) both (A) and (B) (D) None of these

9. Which of the following XML documents are well formed?
(A) <firstElement>
TIME Hyderabad
<secondElement>
Head Office
</secondElement>
</firstElement>
(B) <firstElement>
TIME Hyderabad
</firstElement>
Head Office
</secondElement>
<secondElement>
(C) <firstElement>
TIME Hyderabad
<secondElement>
Head Office
</firstElement>
</second Element
(D) </firstElement>
TIME Hyderabad
</secondElement>
Head Office
<secondElement>
<firstElement>

10. Which of the following XML fragments are well formed?
(A) <myExam mycity = “Hyderabad”/>
(B) <myExam mycity = ‘Hyderabad’/>
(C) <myExam mycity = “Hyderabad/”>
(D) <myExam mycity = ‘Hyderabad/>

11. In the following anchor tag <A HREF = “http://www.time4education.com”> time </A> which one is attribute?
(A) A (B) HREF
(C) time (D) http

12. A link to the document is like this:
– <A HREF =
http://www.time4education/document.html> document </A>
Then the link to proposal section will look like (from within same document)
(A) <A HREF = “#proposal”>
(B) <A HREF = “documents.html #proposal”>
(C) <A HREF = “→ proposal”>
(D) <A HREF = “~ proposal”>

13. DTD includes the specifications about the markup that can be used within the document, the specifications consists of all EXCEPT
(A) the browser name
(B) the size of element name
(C) entity declarations
(D) element declarations

14. Every website has a server process listening to TCP port 80 for incoming connections from clients (normally browsers). After a connection has been established the client sends one request and server sends one reply. Then the connection is released. The protocol that defines the legal requests and replies is called
(A) TFTP (B) FTP
(C) gopher (D) HTTP

15. Given below are several usages of the anchor tag in HTML:
I. < A HREF = “http://www.ebay.com/Html/Basic/Pageno.html”> Hello </A>
II. <A HREF = “/Basic /Pageno.html”> Hello </A>
III. <A HREF = “Pageno.html”>Hello</A>
IV. <A HREF = “Pageno.html # Hello“>Hello</A>
Which of the above are valid?
(A) I and II only (B) I, II, III and IV
(C) I and III only (D) I, II and III only

Practice Problems 2

Directions for questions 1 to 15: Select the correct alternative from the given choices.

1. Which of the following is not case sensitive?
(A) VML (B) XHTML
(C) XML (D) HTML

2. Which of the following statement is false?
(A) W3C stands for World Wide Web consortium.
(B) W3C implements the <layer> tag.
(C) W3C sets the HTML standards.
(D) None of these

3. Which of the following requires a closing tag?
(A) <H_1> (B) <ABBR>
(C) <B> (D) All of these

4. Which of the following does not require a closing tag?
(A) <B> (B) <FONT>
(C)
 (D) <ABR>

5. The smallest heading tag in HTML is
(A) <H_0> (B) <H_1>
(C) <H_6> (D) <H_8>

6. The largest size among the heading tags is
(A) H_6 (B) H_5
(C) H_7 (D) H_1

7. The ____ tag is effective for formatting program code or similar information, usually in a fixed font with ample space between words and lines.
(A) <Pre> (B) <Address>
(C) <Blockquote> (D) <Strong>

8. ____ sets the text characteristics for the document.
(A) <font>
(B) <size>
(C) <color>
(D) <basefont>

9. The tag used for creating a row in a HTML table is
(A) <TR> (B) <TD>
(C) <Table row> (D) <TH>

10. The SRC attribute is used to point to a ____ of the image.
(A) folder (B) file
(C) URL (D) pixel

11. How the position of files will be displayed in browser for the following code?

```
<frameset col’s = “50%, 50%”>
   <frameset rows = ”50%, 50%”>
      <frame src = “file1.html”>
      <frame src = “file3.html”>
   </frame set>
      <frame set rows = “50%, 50%”>
      <frame src = “file2.html”>
      <frame src = “file4.html”>
   </frameset?
</frameset>
```

(A)

50	50	
File 1	File 2	30
File 3	File 4	70

(B)

50	50	
File 1	File 3	30
File 2	File 4	70

(C)

70	30	
File 1	File 4	50
File 2	File 3	50

(D)

30	70	
File 1	File 4	50
File 3	File 2	50

12. 'We may have standalone attributes in XML'. This statement is
(A) True
(B) False
(C) True if it is well-formed
(D) True if it defined in DTD

13. Standalone is one of the possible attributes in the XML declaration. We can set this to ___ if the document does not refer to any external entity.
(A) Yes (B) No
(C) Not required to set it (D) None of these

14. Which of the following is not the difference between HTML and Java script?
(A) HTML is used to create web pages, java script is used to customize the web pages.
(B) HTML provides security where as java script doesn't provide security.
(C) HTML is more preferable by the clients or users where as java script is not more preferable by the users.
(D) HTML is less efficient than java script.

15. <HMTL> and </HMTL> tags indicates the beginning and ending of the document which are compulsory because these indicate that the software is _____.
(A) processing HTML (B) processing XML
(C) processing URL (D) deprocessing HTML

Previous Years' Questions

1. Match the following: **[2015]**

(P) Condition coverage	(i) Black-box testing
(Q) Equivalence class partitioning	(ii) System testing
(R) Volume testing	(iii) White-box testing
(S) Alpha testing	(iv) Performance testing

(A) P–ii, Q–iii, R–i, S–iv
(B) P–iii, Q–iv, R–ii, S–i
(C) P–iii, Q–i, R–iv, S–ii
(D) P–iii, Q–i, R–ii, S–iv

2. Which of the following statements is/are FALSE? **[2015]**

I. XML overcomes the limitations in HTML to support a structured way of organizing content.
II. XML specification is not case sensitive while HTML specification is case sensitive.
III. XML supports user defined tags while HTML uses pre-defined tags.
IV. XML tags need not be closed while HTML tags must be closed.

(A) II only (B) I only
(C) II and IV only (D) III and IV only

3. Consider the following C program segment.

```
while(first <= last)
{
   if (array[middle] < search)
            first = middle + 1;
   else if (array[middle] == search)
               found = TRUE;
            else last = middle - 1;
   middle = (first + last)/2;
}
if (first > last) notPresent = TRUE;
```

The cyclomatic complexity of the program segment is ______.

4. A software requirements specification (SRS) document should avoid discussing which one of the following? **[2015]**
(A) User interface issues
(B) Non-functional requirements
(C) Design specification
(D) Interfaces with third party software

5. Consider the basic COCOMO model where E is the effort applied in person-months, D is the development time in chronological months, KLOC is the estimated number of delivered lines of code (in thousands) and a_b, b_b, c_b, d_b have their usual meanings. The basic COCOMO equations are of the form **[2015]**
(A) $E = a_b(\text{KLOC})\exp(b_b)$, $D = c_b(E)\exp(d_b)$
(B) $D = a_b(\text{KLOC})\exp(b_b)$, $E = c_b(D)\exp(d_b)$
(C) $E = a_b\exp(b_b)$, $D = c_b(\text{KLOC})\exp(d_b)$
(D) $E = a_b\exp(d_b)$, $D = c_b(\text{KLOC})\exp(b_b)$

6. Which one of the following statements is NOT correct about HTTP cookies? **[2015]**
(A) A cookie is a piece of code that has the potential to compromise the security of an Internet user.
(B) A cookie gains entry to the user's work area through an HTTP header.
(C) A cookie has an expiry date and time.
(D) Cookies can be used to track the browsing pattern of a user at a particular site.

7. Which one of the following assertions concerning code inspection and code walkthrough is true? **[2015]**

(A) Code inspection is carried out once the code has been unit tested.
(B) Code inspection and code walkthrough are synonyms
(C) Adherence to coding standards is checked during code inspection
(D) Code walkthrough is usually carried out by independent test team

8. Consider a software project with the following information domain characteristics for calculation of function point metric.

Number of external inputs (I) = 30

Number of external outputs (O) = 60

Number of external inquiries (E) = 23

Number of files (F) = 08

Number of external interfaces (N) = 02

It is given that the complexity weighting factors for I, O, E, F and N are 4, 5, 4, 10 and 7, respectively. It is also given that, out of fourteen value adjustment factors that influence the development effort, four factors are not applicable, each of the other four factors have value 3, and each of the remaining factors have value 4. The computed value of function point metric is ______ **[2015]**

9. In a web server, ten WebPages are stored with the URLs of the form http://www.yourname.com/var.html; where, var is a different number from 1 to 10 for each Webpage. Suppose, the client stores the Webpage with var = 1 (say W_1) in local machine, edits and then tests. Rest of the WebPages remains on the web server. W_1 contains several relative URLs of the form 'var.html" referring to the other WebPages. Which one of the following statements needs to be added in W_1, so that all the relative URLs in W_1 refer to the appropriate WebPages on the web server? **[2015]**

(A) <a href: http://www.yourname.com/", href: "var.html">
(B) <base href: http://www.yourname.com/">
(C) <a href: http://www.yourname.com/">
(D) <base href: http://www.yourname.com/", range: "var.html">

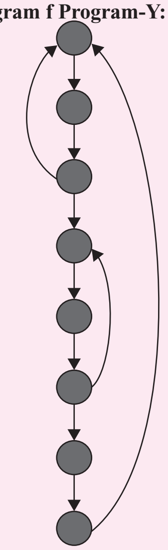
10. Consider a software program that is artificially seeded with 100 faults. While testing this program, 159 faults are detected, out of which 75 faults are from those artificially seeded faults. Assuming that both real and seeded faults are of same nature and have same distribution, the estimated number of undetected real faults is _________. **[2015]**

11. Consider three software items: Program-X, Control Flow Diagram of Program-Y and Control Flow Diagram of Program-Z as shown below **[2015]**

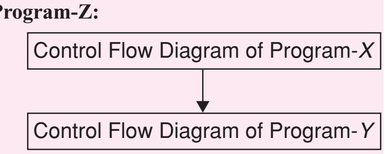
Program-X:

```
Sumcal (int maxint, int value)
{
int result=0, i=0;
if (value <0)
{
Value = -value;
}
While  (  (i<value)  AND  (result  <=
      maxint
{
i=i+1;
result = result + 1;
}
if (result <= maxint)
{
printf (result);
}
else
{
printf ("large")
}
printf ("end of program");
}
```

Control Flow Diagram f Program-Y:



Control Flow Diagram of Program-Z:



The value of McCabe's Cyclomatic complexity of program-X, Program-Y, and Program-Z respectively are

(A) 4, 4, 7 (B) 3, 4, 7
(C) 4, 4, 8 (D) 4, 3, 8

Test

Web Technologies

Time: 60 min.

Directions for questions 1 to 30: Select the correct alternative from the given choices.

1. The ______ tag contains information about the document including its title, scripts used, style definitions and documentation descriptions.
(A) <Head> (B) <Body>
(C) <HTML> (D) <Title>

2. Is it easier to process XML than HTML?
(A) Yes (B) No
(C) Sometimes (D) Can't say

3. Which of the following tags is the smallest heading tag?
(A) <H1> (B) <H6>
(C) <H0> (D) <H8>

4. In XML
(A) the internal DTD subset is read before the external DTD
(B) the external DTD subset is read before the internal DTD
(C) there is no external type of DTD
(D) there is no internal type of DTD

5. Attribute standalone = "no" should be included in XML declaration if a document
(A) is linked to an external XSL style sheet
(B) has external general references
(C) has processing instructions
(D) has an external DTD

6. Which of the following XML fragments are well-formed?
(A) <myEle myAtt = 'val1 = val2'/>
(B) <myEle myAtt = 'val1>val2'/>
(C) <myEle myAtt = 'val1>val2'/>
(D) None of the above

7. Parameter entities can appear in
(A) XML file (B) DTD file
(C) XSL file (D) Both (A) and (B)

8. The use of a DTD in XML document is
(A) required when validating XML document
(B) no longer necessary after the XML editor has been customized
(C) used to direct conversion using an XSLT processor
(D) a good guide to populating a template to be filled in when generating an XML document automatically.

9. To add the attribute named 'Branch' to the <Time> tag the syntax will be
(A) <Time attribute Branch = "DSNR">
(B) <Time Branch attribute = "DSNR">
(C) <Time Branch = "DSNR">
(D) None of these

10. The syntax for parameter entity is
(A) <!ELEMENT % NAME DEFINITION>
(B) <!ENTITY % NAME DEFINITION>
(C) <!ENTITY $ NAME DEFINITION>
(D) <ENTITY % NAME DEFINITION>

11. A schema can be named using the name attribute like
(A) <schema attribute = "schema1">
(B) <schema nameattribute = "sehema1">
(C) <schema nameattri = "schema1">
(D) <schema name = "schema1">

12. A schema describes
(i) grammer
(ii) vocabulary
(iii) structure
(iv) data type of XML document
(A) (i) and (ii) (B) (iii) and (iv)
(C) Both (A) and (B) (D) None of the above

13. The XML DOM object is
(A) an attribute (B) entity reference
(C) comment reference (D) comment data

14. The default model for COMPLEXTYPE, in XML schema for element is
(A) text only (B) element only
(C) no default type (D) Both (A) and (B)

15. To create a choice in XML schemas, we use
(A) <xsd: select> element
(B) <xsd: multi> element
(C) <xsd: choice> element
(D) <xsd: single> element

16. To bind the HTML element <INPUT> Type in text with the data source "dsoCustomer" we use
(A) <INPUT TYPE = "TEXT" DATAFIELD = "#dsoCustomer">
(B) <INPUT TYPE = "TEXT" DATASRC = "dsoCustomer">
(C) <INPUT TYPE = "TEXT" DATASRC = "#dsoCustomer">
(D) <INPUT TYPE = "TEXT" DATAFLD = "*dsoCustomer">

17. The attribute used to define a new namespace is
(A) XMLN Space (B) Xml Name Space
(C) Xmlns (D) XmlNs

18. Identify the most accurate statement about the application of XML:
(A) XML must be used to produce XML and HTML output.
(B) XML can not specify or contain presentation information.

(C) XML is used to describe hierarchically organized information.
(D) XML performs the conversion of information between different e-business applications.

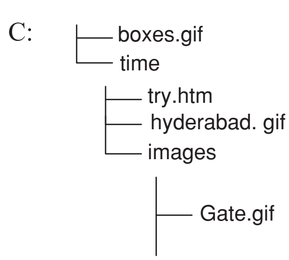
19. What is an XML namespace?
(A) A set of names applied to specific spaces within an XML document, such as the head and body.
(B) A set of names representing a specific XML vocabulary.
(C) Both (A) and (B)
(D) None of these

20. The standard model for network application is
(A) producer consumer model
(B) node-node model
(C) system-system model
(D) client-server model

21. Which is/are example of service(s) that a server can provide?
(A) Return the time-of-day to the client.
(B) Print a file for the client
(C) Execute a command for the client on the server's system
(D) All of the above

22. Print a file, read or write a file for client are handled in a
(A) iterative fashion
(B) concurrent fashion
(C) Both (A) and (B)
(D) None of these

Common data for questions 23 and 24: Consider working with the file try.htm and provided the following directory structure:



23. The tag specification to use boxes.gif file as background will be
(A) <Body BACKGROUND = "/boxes.gif">
(B) BODY BACKGROUND = "/boxes.gif
(C) <BODY BACKGROUND = "boxes.gif">
(D) <BODY BACKGROUND = "#boxes.gif">

24. The tag specification to use gate.gif file as back ground will be
(A) <BODY BACKGROUND = "../gate.gif">
(B) <BODY BACKGROUND = ".gate.gif">
(C) <BODY BACKGROUND = "images/gate.gif">
(D) None of these.

25. Consider below HTML code:
(1) <HTML>
(2) <FRAMESET ROWS = "30%, *">
(3) <FRAMESET COLS = "50%, 50%">
(4) <FRAME Src = "file1. html">
(5) <FRAME Src = "File2.html">
(6) </FRAMESET>
(7) <FRAMESET COLS = "50%, 50%">
(8) <FRAME Src = "File3.html">
(9) <FRAME Src = "File4.HTML">
(10) </FRAMESET>
(11) </FRAMESET>
(12) </HTML>
We can embed <BODY> tag at line number.
(A) 2 (B) 11
(C) Anywhere (D) No where

26. What is the purpose of <area> tag?
(A) It defines an area inside a table.
(B) It defines an area inside an image map.
(C) It defines the area of total HTML code.
(D) Both (A) and (B)

27. Which of the following tag is used to define a section in a document?
(A) <frame> (B)
(C) <div> (D) <wbr>

28. Which of the following is not a syntax rule of an XML document?
(A) All XML tags must have a closing tag.
(B) All XML tags are case-sensitive.
(C) XML elements must be properly nested.
(D) XML documents may or may not have a root tag.

29. XML documents follow which structure?
(A) Graph (B) Tree
(C) Stack (D) Queue

30. Which of the following is an advantage of client-server computing?
(A) Client-server computing provides cost-effective user interface.
(B) Client-server computing provides storage for data.
(C) Client-server computing provides application services.
(D) All the above

Chapter 1

Process Life Cycle

LEARNING OBJECTIVES

- *Introduction*
- *Process vs program*
- *Software component and elements*
- *Information gathering*
- *Requirement analysis*
- *Feasibility study*
- *Data flow diagram*
- *Process specification*
- *Input/output design*
- *Software process life cycle*
- *Software process model*

Introduction

A system can be defined as an orderly grouping of interdependent components linked together according to a plan to achieve a specific objective.

Example: Telephone system, transportation system, accounting system, etc.

Process Versus Program

A software process gives all steps used to create a software application, from the customer's requirements to the finished product.

- The software process determines the organization and flexibility of the project.
- There are several different software processes and each describes their own solution to develop a valid software.
- Software programs are written programs or rules with associated documentation pertaining to the operation of a computer system.

Software Components and Elements

Software Component

It is a software element that can be independently deployed and composed without modification according to a composition standard.

- A component model implementation is the dedicated set of executable software elements required to support the execution of components.
- A component has clearly defined interfaces.
- An interface standard is the mandatory requirement enforced to enable software elements to directly interact with other software elements.
- An interface standard declares, when an interface comprises.

Standard An object or measure serving as a basis to which others should conform, by which the quality of others is judged.

Software Element

A sequence of abstract program statements that describe computations, which has to be performed by a machine.

Interface

It describes the behavior of a component that is obtained by considering only the interactions of that interface and by hiding all other interactions.

- An abstraction of the behavior consists of subset of the interactions of one component together with a set of constraints.

Interaction

It is defined as action between 2 or more software elements.

Composition It is a combination of 2 or more software components, the newly formed component, behaviour will be at a different level of abstraction.

The characteristics of new component is determined the components combined and the way in which they are combined.

Information Gathering

Complete and accurate information is essential in building computer-based systems. Information about the organization, the staff who uses the system and the workflow should be gathered.

Information about the organization's policies, goals, objectives and structure explains the kind of environment the computer-based system should produce.

Information about the people who run the present system, their job functions and information requirements, the relationships of their jobs to the existing system and the interpersonal network that holds the user groups together are required for determining the importance of the existing system for the organization and also for planning the proposed system.

Workflow focuses on what happens to the data through various points in a system and can be shown by a data flow diagram or a system flow chart.

Information can be gathered by studying documents, forms and files of existing system. Onsite observation of the system is also an effective method for gathering information. It is the process of recognizing and noting people, objects and occurrences to obtain information. Interview is one of the most often and oldest method for gathering information. Interview has the advantage of identifying relations or verifying information and also capture information face to face with the concerned person. Questionnaire is another method for gathering information and is an inexpensive mean for gathering data which can be tabulated and analyzed quickly. Visiting companies that have developed similar systems, reading journals and other computer related books, which specify how others have solved similar problems is also another means of information gathering.

Requirement Analysis

Requirement analysis results in specification of software's operational characteristics, indicates software's interface with other system elements and establishes constraints that the software must meet.

During requirement analysis, the primary focus should be on *what* not *how*. It should define what user interaction occurs in a particular circumstance, what objects does the system manipulate, what functions must the system perform, what behaviours does the system exhibit, what interfaces are defined and what constraints applied.

The requirement analysis model must achieve three primary objectives:

1. To describe what the customer requires.
2. To establish a basis for the creation of a software design
3. To define a set of requirements that can be validated once the software is built.

Requirement Negotiation

Requirement negotiation is required to have a win-win result. The customer should get product which satisfies most of his/her needs, and software team should develop a product within a budget, working in real-time environment and within deadlines.

Boehm has defined negotiation activities at the beginning of each software process iteration.

- Identify the key stake holder's system or subsystem.
- Determine the 'win conditions' of the stake holder.
- Negotiate the 'win conditions' of stake holder and establish them into win-win condition.

Requirement Elicitation

Requirement elicitation is gathering the requirements from stakeholders, customers, etc. The question and answer format is suitable for the first encounter with users and the remaining phases are replaced with requirement elicitation. As we can't get all the requirements by having questions and answers session, requirement elicitation practices should be implemented, which includes interviews, workshops, user scenarios, etc.

The approaches that are followed for eliciting the requirements are:

1. Collaborative requirement gathering
2. Quality function deployment
3. User scenarios
4. Elicitation work products

Functional Requirements

Functional requirements are primary actions that must take place in software in accepting and processing the input and in processing and generating the output.

Functional requirements capture the intended behaviour of the system, which could be expressed as service task (or) functions of the system.

These are core functionalities of the system. It also includes exact sequence of operations, input validation, mapping of outputs to inputs and error handling and recovery. These requirements are implemented in system design.

Non-functional Requirements

Non-functional requirements are expected requirements of a user. These define operational constraints based on the user characteristics.

Non-functional requirements are product, business and external-based. These requirements define how a software system has to be. It also defines the quality of product, type of reliability and usability of the system. Implementation requirements depend on organization, and delivery requirements are defined in the non-functional requirements.

Non-functional requirements are implemented in system-architecture.

Measuring Requirements

The requirements are the major component of project. The metrics for the requirement activities are:

1. Product size
2. Requirement quality
3. Requirement status
4. Requirement change (request for changes)
5. Effort

Product size refers to the count of functional and non-functional requirements. It tracks, whether these requirements are implemented as a function of time.

Requirement quality refers to the inspection of specification of requirements, counting the defects, missing of requirements incompleteness, ambiguities, etc.

Requirements status is monitoring of requirements over time, gives out project status. The status could be proposed, approved, implemented, verified deferred, deleted, rejected.

Requirement management handles the addition, modify and deletion of requirement, track the change of requirement which affects multiple requirements of different level.

Effort is the time taken to record requirements activities which includes development and management of requirements.

Types of Requirements

These are the services that a software system has to provide and constraints under which it must operate.

User requirements

- Written for customers.
- These statements will be given in natural language and diagrams of the services that the system provides and operational constraints.

System requirements

- Written as a contract between contractor and client.
- A structured document with detailed descriptions of the system services.

Software specification

- Written for developers.
- A detailed description of software that can act as basis for a design (or) implementation.

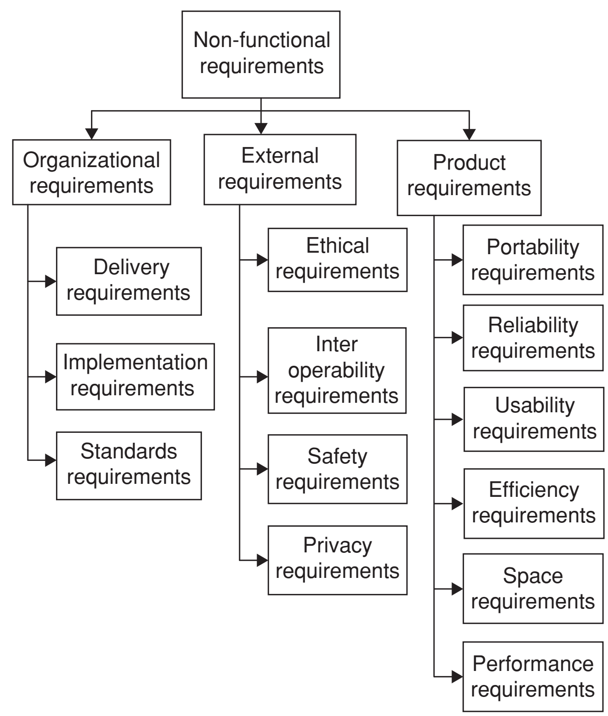
Functional requirements

The system should provide statements of services, how the system should react to particular inputs and how the system should behave in particular situations.

Non-functional requirements

Functions offered by the system such as timing constraints, constraints on the development process, standards, etc.

1. *Product requirements:* It specifies, that the delivered product must behave in a particular way.
   Example: Execution speed, reliability
2. *Organizational requirements:* These are consequences of organizational policies and procedures.
   Example: Process standards, implementation requirements
3. *External requirements:* These arise from factors which are external to the system and its development process.
   Example: Interoperability requirements



Domain requirements

These come from the application domain of the system that reflects the characteristics of the domain.

- These could be functional or non-functional.

Feasibility Analysis

Feasibility study is a test of a system proposal according to its workability, impact on the organization, ability to meet user needs, and effective use of resources.

The objective of a feasibility study is not to solve the problem but to acquire a sense of its scope. Costs and benefits are estimated with greater accuracy at this stage. Feasibility analysis helps to identify the best solution to the end user. The key considerations involved in feasibility analysis are:

1. Economic feasibility
2. Technical feasibility
3. Behavioral feasibility

Economic analysis is the most frequently used method for evaluating the effectiveness of a candidate system. Also known as cost/benefit analysis, economic analysis determines the benefits and savings that are expected from the candidate system and compares them with the costs. If benefits outweigh costs, then decision is made to design and implement the system, else alterations are made if it has a chance of being approved.

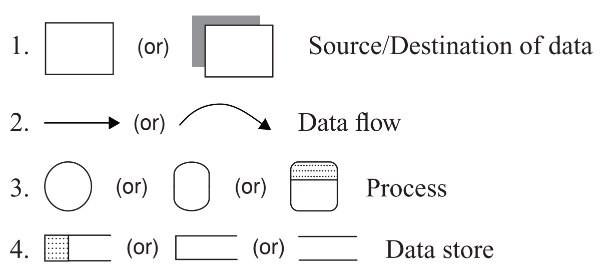
Technical feasibility is concerned with hardware and software requirements to implement the system. Technical analysis centres around the existing computer system (hardware, software, etc.) identifies, to what extent it can support the proposed addition. Additional hardware and software (OS, databases) requirements are identified and checks whether financial considerations/constraints can accommodate these technical enhancements.

Behavioural analysis makes an estimate of how strong a user staff is likely to react towards the development of a computerized system. Computer installations usually changes employee job status, and also there may be transfer, training period, etc. Thus the introduction of a new system requires special effort to educate, sell and train the staff on new ways of conducting business.

Data Flow Diagrams (DFD)

DFD also called bubble chart, clarifies system requirements and identifies major transformations that will become programs in system design. It functionally decomposes the requirements specification down to the lowest level of detail.

The four DFD symbols are:



The first symbol defines a source or destination of system data. The second symbol specifies data flow direction. It can be considered as a pipeline through which the information flows. The third symbol represents a process that transforms incoming data flows into outgoing data flows, and the fourth symbol is used to represent storage of data.

In short, DFD takes an input-process-output view of a system. That is, data objects flow into the software is transformed by processing elements and resultant data objects flow out of the software. Data objects are represented by labelled arrows and transformations are represented by circles (also called bubbles). The DFD is presented in a hierarchical fashion. That is, the first data flow model sometimes called level 0 DFD or context diagram represents the system as a whole. Subsequent data flow diagrams refine the context diagram, providing increase in detail with each subsequent level.

Process Specification (PSPEC)

The process specification (PSPEC) is used to describe all flow model processes that appear at the final level of refinement. The content of the process specification can include narrative text, a program design language (PDL) description of the process algorithm, mathematical equations, tables or UML activity diagrams.

By providing a PSPEC to accompany each transformation (bubble) in the flow model, a 'mini-spec' can be created that serves as a guide for design of the software component that will implement the transformation.

Input/Output Design

Input Design

The most common cause of errors in data processing is inaccurate input data. Errors occurred during data entry can be controlled by input design.

Input design is the process of converting user-originated inputs to a computer-based format.

Input data is collected and organized into groups of similar data. The goal of designing input data is to make data entry easy, logical and free from errors.

Source data is captured initially on original paper or a source document. A source document should be logical and easy to understand. Each area in the form should be clearly identified and should specify to the user what to write and where to write.

Source documents may enter into the system from punch cards, diskettes, optical character recognition (OCR) reader, Magnetic ink character recognition (MICR) reader, barcode reader, etc. Touch screen or voice input can be used for online data entry, for example, ATM.

There are three major approaches for entering data into the computer—menus, formatted forms and prompts.

A menu is a selection list that simplifies computer data access or entry. The user can choose what to enter from a list of options. Though a menu limits a user choice of responses, it reduces the chances of errors in data entry.

A formatted form is a preprinted form or a template that requests the user to enter data in appropriate locations (fill-in the blank type form). The form is displayed on the screen and the user can fill information by positioning the cursor in appropriate text boxes.

In prompt, the system displays one inquiry at a time, asking the user for a response, for example, asking for user-id and password.

Output Design

Computer output is the most important and direct source of information to the user. Efficient and intelligible output design will improve system's relationships with the user and helps in decision making.

The devices available for providing computer-based output are printer, CRT screen display, audio response (speaker), plotters, etc.

The task of output preparation is very critical, regaining skill and ability to align user requirements with the capabilities of the system in operation.

SOFTWARE PROCESS LIFE CYCLE

A software process can be defined as a frame work of the activities, actions and tasks that are required to build quality software.

All these activities, actions and tasks reside within a frame work or model that defines their relationship with the process and with one another.

A generic process frame work for software engineering encompasses five activities:

Communication Proper communication and collaboration with the customer is made in this activity to understand the objectives for the project and also to gather requirements that help to define software features and functions.

Planning This activity develops a software project plan which defines the software engineering work by specifying the technical tasks to be conducted, the risks that may occur, the resources that will require, the work products to produce and the work schedule.

Modelling A software engineer creates models to better understand software requirements and the design that will achieve those requirements.

Construction This activity combines code generation and testing required to uncover errors in the code.

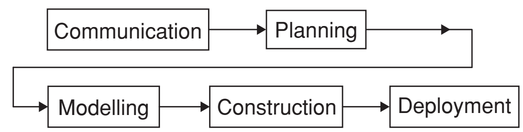
Deployment In this activity, the software (as a complete product or as a partial increment) is delivered to the customer. The customer evaluates the delivered product and provides feedback based on evaluation.

Another important aspect of the software process called process flow describes how the frame work activities and the actions and tasks that occur within each framework activity are organized with respect to sequence and time.

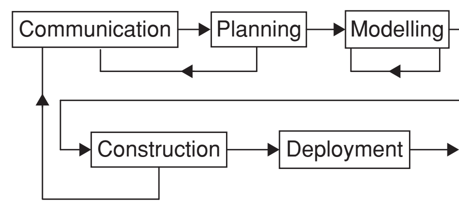
Process Quality and Improvement

Quality refers to characteristic or attribute of something. Process quality factors are portability, usability, reusability, correctness and maintainability. The process quality is the implementation of the following steps firstly initiates the process and design the solutions, implement these solutions with the impact demonstration.

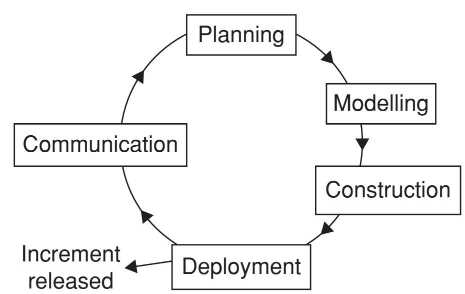
Linear process flow executes each of the five framework activities in sequence, beginning with communication and ends with deployment.



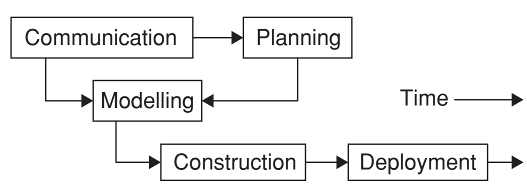
Iterative process flow repeats one or more of the activities before proceeding to the next activity.



Evolutionary process flow executes the activities in a circular manner. Each circuit through the five activities leads to a more complete version of the software.



Parallel process flow executes one or more activities in parallel with other activities.



The Unified Process

The unified process (UP) is an attempt to draw on the best features and characteristics of conventional software process models. It recognizes the importance of customer communication and streamlined methods for describing the customer's view of a system. It helps the architect focus on the right goals, such as understandability, reliance to future changes, and reuse. It suggests a process flow that is iterative and incremental, providing the evolutionary feel that is essential in modern software development.

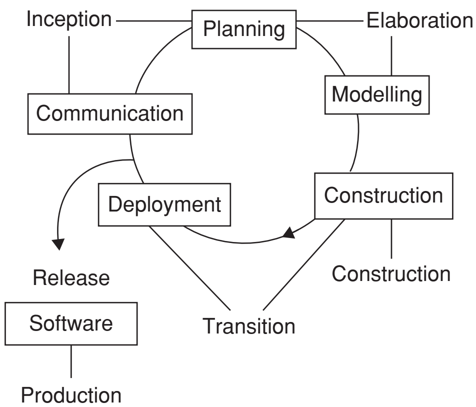


Figure 1 Phases of the unified process

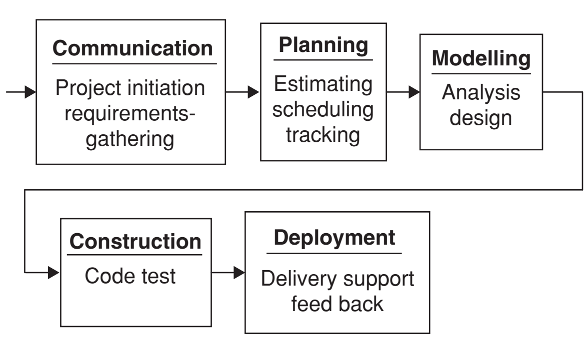
The unified process is an incremental model in which five phases are defined:

1. Inception phase: Encompasses both customer communication and planning activities and emphasizes the development and refinement of use cases as a primary model.
2. Elaboration Phase: Encompasses the customer communication and modelling activities focusing on the creation of analysis and design models with an emphasis on class definitions and architectural representations.
3. Construction phase: Refines and translates the design model into implemented software components.
4. Transition phase: Transfers the software from the developer to the end user for beta testing and acceptance.
5. Production phase: Ongoing monitoring and support are conducted. Defect reports and requests for changes are also submitted and revaluated.

Software Process Models

The Waterfall Model

The waterfall model also called classic life cycle, follows a systematic sequential approach to software development.



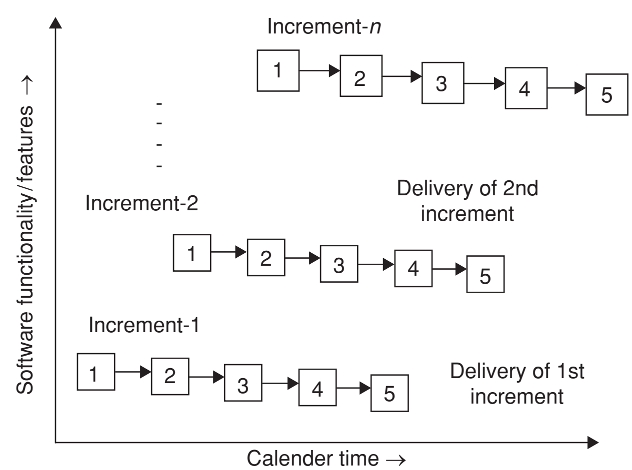
It begins with customer specification of requirements and progresses through planning, modelling, construction and deployment, culminating in on-going support of the completed software.

The waterfall model is the oldest paradigm for software engineering. The problems encountered when this model is applied are:

1. Real projects rarely follow the sequential flow that the model proposes.
2. This model requires the requirements explicitly which the customer cannot state all the requirements as it is difficult.
3. A working version of the program will not be available until late in the project time span. If a major blunder is undetected until the working program is reviewed, it can be disastrous.

Incremental Process Model

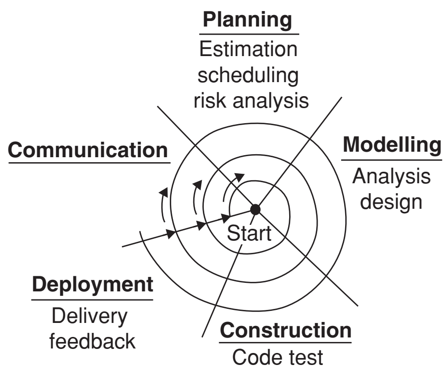
1. Communication
2. Planning
3. Modelling (analysis, design)
4. Construction (code, test)
5. Deployment (delivery, feedback)



Incremental development is particularly useful when staffing is unavailable for a complete implementation by the business deadline that has been established for the project.

Spiral Model

Spiral model is an evolutionary software process model. Using spiral model, software is developed in a series of evolutionary releases. During early iterations, the release might be a model or prototype. Later iterations produce more complete versions of the system.



The spiral development model is a risk-driven process model generator that is used to guide multi stakeholder concurrent engineering of software intensive systems.

The spiral model is a realistic approach to the development of large scale systems and software. It uses prototyping as a risk reduction mechanism but, more importantly, enables the developer to apply the prototyping approach at any stage in the evolution of the product. At demands a direct consideration of technical risks at all stages of the project.

Conceptual Modelling

Conceptual modelling refers to abstraction of a model which fits for the purpose. The purpose of this modelling is to make model valid credible, feasible and useful.

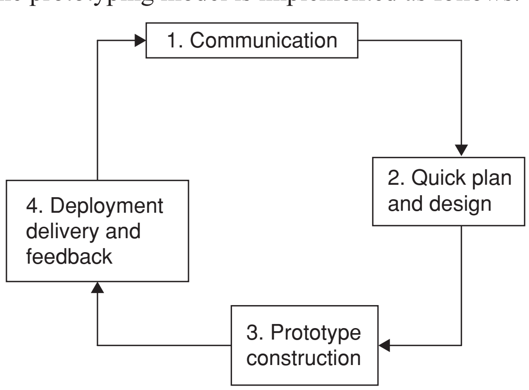
The main objective of conceptual modelling is improvising the understanding of an individual with respect to the system, an approach which will convey the system details among the stakeholders.

For the extraction of system specifications when a software is developed, some of the failures could occur in future due to lack of requirements [unclear requirements (or) changing requirements] This could be traced with the help of conceptual modelling.

Prototyping Model

Prototyping model is used when the user is not sure about the addition of requirements in the product. It is also implemented when the developer is not sure about the algorithm efficiency, operation system adaptability, etc. Prototyping paradigm provides the approaches.

The prototyping model is implemented as follows:



Prototyping model starts with communication in which software objectives is defined requirement, identification are done. In quick design, all the software aspects are represented quick design leads to prototype construction.

This prototype model is deployed, in which requirements are evaluated and refined by customer.

The iteration is done until customer gets satisfied with the needs at the same time developer will come to know what are the needs to be done.

Disadvantages

1. Developer may compromise at implementation, as prototyping works quickly. Un-ideal implementation issues may become an integral part of the system.
2. Customer just sees the working version of the software, he could not able to consider the quality of software and long-term maintenance.

Though there are some problems with prototyping, but it is effective paradigm for the software engineering when a software is developed using prototyping, both developer and customer should agree on the prototype.

It is more advantageous when the customer and user are not sure what they want it maintains a template of the older software.

Role of metrics and measurement in software development

The software attributes that were present in process, project and product levels are called measurement.

The metric refers to the attributes that are included in the project.

A software engineer gets the measurements and develops the metrics.

Measurement is done in two ways:

1. Direct measure
2. Indirect measure

Direct measure includes the lines of code, (least, moderate, worst) execution speed and size of the memory.

Indirect measure is done with the help of functional points. It measures quality, maintainability, efficiency and reliability.

Metric is used to control the cost, schedule, project quality. It means metric provides information for the control of process development.

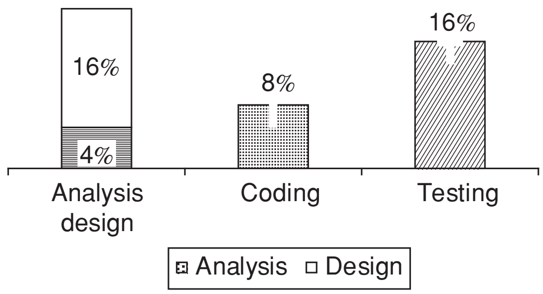
Effort distribution with phases

Software development is done in phases. It includes analysis, design, coding and testing.

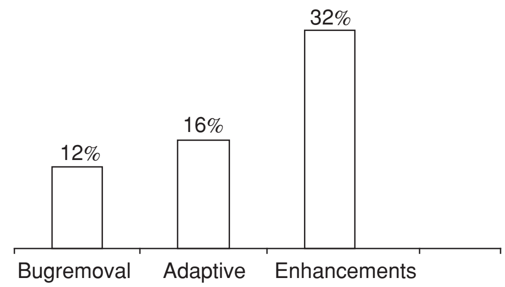
Design and testing plays major role in development, while coding is having least preference.

40% of the efforts were done on development and 60% of efforts are on the maintenance.

Distribution of the efforts on the development is shown below:



Maintenance includes removal of bug and corrective maintenance, adaptive maintenance and enhancement. Distribution of efforts in maintenance is shown below:



Exercises

Practice Problems I

Directions for questions 1 to 15: Select the correct alternative from the given choices.

1. Which of the following statements is true?
   (A) The first step to the system study project is to announce the study project.
   (B) During the system study analysis determine manager's information needs by asking questions.
   (C) During the system study, flowcharts are drawn using general symbols.
   (D) All the above
2. Which of the following statement(s) is true regarding the spiral model of software development?
   (A) In the spiral model of software development, the primary determinant in selecting activities in each interaction is risk.
   (B) The spiral model is a risk driven process model generator that is to guide multi-stakeholder. Concurrent engineering of software intensive systems.
   (C) Using the spiral model, software is developed in a series of evolutionary releases.
   (D) All the above
3. Which of the following is a step in feasibility analysis?
   (A) Form a project team and appoint a project head.
   (B) Determine and evaluate performance and cost effectiveness of each candidate system.
   (C) Weigh system performance and cost data.
   (D) All the above
4. Which of the following statement(s) is true?
   (A) The risk driven nature of the spiral model allows it to accommodate any mixture of specification oriented or some other approach.
   (B) Each cycle of spiral is completed by review which covers all the products developed during that cycle, including plans for the next cycle.
   (C) Spiral model works for development as well as enhancement project.
   (D) All the above
5. Data flow diagram, regular expression and transition table can be combined to provide
   (A) decision table for functional specification of system software.
   (B) finite state automata for functional specification of system software.
   (C) event table for functional specification of system software.
   (D) None of these
6. Which of the following statements are true about software configuration management tool?
   (A) It keeps track of the schedule based on the mile stones reached.
   (B) It manages man power distribution by changing the structure of the project.
   (C) It maintains different versions of the configurable items.
   (D) All the above
7. The cost incurred on a project was ₹250,000 and benefits were ₹30,000 per month. The payback period using simple pay back method is
   (A) 8 months (B) 8.3 months
   (C) 12 months (D) 1.2 months
8. Which of the following phase has the maximum effort distribution?
   (A) Testing (B) Information gathering
   (C) Requirement analysis (D) Coding
9. Which of the following statement is true regarding cost benefit analysis?
   (A) It evaluates tangible and non-tangible factors.
   (B) It estimates the hardware and software costs.
   (C) It compares the cost with the benefits of introducing a computer-based system.
   (D) All the statements are true.
10. A project is considered economically feasible if the following factor holds good.
    (A) Return on investment (ROI)
    (B) Total cost of ownership (TCO)

(C) Gross domestic product (GDP)
(D) Net present value (NPV)

11. At the end of the feasibility study the system analyst
(A) meets the users for a discussion.
(B) gives system proposal to management.
(C) gives a feasibility report to management.
(D) gives a software requirement specification (SRS).

12. In a data flow diagram, data flows cannot take place between
(A) two data stores
(B) two external entities
(C) a data store and an external entity
(D) Both (A) and (B)

13. Consider the decision table shown below. It is

	R_1	R_2	R_3	R_4
C1	Y	Y	Y	N
C2	Y	N	Y	Y
C3			Y	Y
A1	X		X	
A2		X		X

(A) an ambiguous decision table.
(B) a complete decision table.
(C) an incomplete decision table.
(D) Both (A) and (B)

14. Which of the following requirement specifications can be validated?
(S1): If the system fails during any operation, there should not be any loss of data.
(S2): Checking the hardware compatibility.
(S3): Defining a data interface.
(S4): Specification of response time for various functions.
(A) S1 and S2 (B) S2, S3 and S4
(C) S1, S3 and S4 (D) S1 and S4

15. Which of the following are true?
(i) A DFD should have loops.
(ii) A DFD should not have crossing lines.
(iii) Leveled DFD is easier to understand.
(iv) Context diagrams are not used in DFDs.
(A) (ii) and (i) (B) (i) and (iv)
(C) (ii) and (iii) (D) (iii) and (iv)

Practice Problems 2

Directions for questions 1 to 15: Select the correct alternative from the given choices.

1. Questionnaire consists of
(A) Forms (B) Documents
(C) Qualitative data (D) Quantitative data

2. The method to obtain qualitative information is
(A) Background information
(B) Questionnaires
(C) Interviewing technique
(D) Journals and reports on similar systems

3. Which among the following is a functional requirement?
(A) Description of all input data and their sources
(B) Capacity requirements
(C) Operating system available on the system
(D) Maintaining a log of activities

4. The advantage of use case during requirement analysis phase is, it
(A) focuses on external behaviour only.
(B) focuses on internal behaviour only.
(C) focuses on additional behaviour.
(D) focuses on internal and external behaviour.

5. Operational feasibility refers to
(A) technology needed is available and if available whether it is usable
(B) the proposed solution can fit in with existing operations
(C) the money spent is recovered by savings
(D) superior quality of products

6. Software engineering is the application of
(A) Systematic approach of the development
(B) Quantifiable approach of the development
(C) Discipline approach of the development
(D) All of these

7. The data flow model of an application mainly shows:
(A) The underlying data and the relationship among them
(B) Processing requirement and the flow of data
(C) Decision and control information
(D) Communication network structure

8. DFD completeness is
(A) The process of discovering discrepancies between two or more sets of DFDs or discrepancies within a single DFD.
(B) The extent to which all necessary components of a data flow diagram have been included and fully decomposed.
(C) The conversation of inputs and outputs to a DFD process when that process is decomposed to a lower level.
(D) An iterative process of breaking the description of a system down into a finer and finer details, which creates a set of charts in which one on a given chart is explained in greater detail on another chart.

9. The requirement analysis is performed in
(A) System design phase
(B) System development phase
(C) System analysis phase
(D) System investigation phase

10. In data flow diagram, an originator or receiver of data is usually designed by
(A) square box (B) circle
(C) rectangle (D) arrow

11. A feasibility document should contain all the following except
(A) project name
(B) problem description
(C) feasible alternative
(D) data flow diagrams

12. SRS document is _______ between customers and developers.
(A) legal contract
(B) standard
(C) request proposal
(D) None of the above

13. According to Brooks, adding more people to an already late software project makes it
(A) late
(B) fast
(C) does not impact schedule
(D) None of the above

14. The following is a quality metric:
(A) Correctness
(B) Maintainability
(C) Usability
(D) All of the above

15. Feasibility study should focus on
(A) Technical feasibility
(B) Economic feasibility
(C) Operational feasibility
(D) All of the above

Previous Years' Questions

1. What is the appropriate pairing of items in the two columns listing various activities encountered in a software life cycle? **[2010]**

P	Requirements capture	1	Module development and integration
Q	Design	2	Domain analysis
R	Implementation	3	Structural and behavioural modelling
S	Maintenance	4	Performance tuning

(A) P–3, Q–2, R–4, S–1
(B) P–2, Q–3, R–1, S–4
(C) P–3, Q–2, R–1, S–4
(D) P–2, Q–3, R–4, S–1

2. Which one of the following is NOT desired in a good SRS document? **[2011]**
(A) Functional requirements
(B) Non-functional requirements
(C) Goals of implementation
(D) Algorithms for software implementation

Chapter 2

Project Management and Maintenance

LEARNING OBJECTIVES

- *Project management*
- *Software design*
- *Modeling component level design*
- *SRS*
- *Software testing*
- *White-box testing*
- *Black box testing*
- *Implementation maintenance*
- *Software quality assurance*
- *Software Re-engineering*
- *COCOMO MODEL*

Project Management

Project management is a technique used to ensure successful completion of a project by the project managers.

The functions included in project management are:

- Estimating resource requirements
- Scheduling tasks and events
- Providing training and site preparation
- Selecting qualified staff and supervising their work
- Monitoring the projects program
- Documenting
- Periodic evaluation
- Contingency planning

Project management involves planning, organization and control projects. It uses tools and software packages for planning and managing projects.

Project planning involves plotting project activities against time frame.

Project Planning Tools

- Tools used during software planning
- Helps the top level managers to take critical decisions during planning stage

Gantt Charts

This activity scheduling method introduced in 1914 by Henry L. Gantt, uses horizontal bars to show the duration of actions or tasks. The left end marks the beginning of the task and the right end its finish. Earlier tasks appear in the upper left and later ones in the lower right.

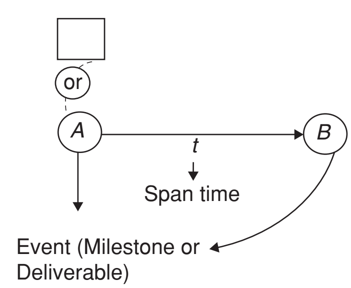
In real-life applications, an allowance for contingencies is provided. This is called **slack time.** Each project allows between 5 to 25 percent slack time for completion.

Program Evaluation and Review Technique (Pert)

Gantt charts do not show precedence relationships among the tasks and milestones of a project.

A PERT chart is a project management tool used to schedule, organize and coordinate tasks within a project.

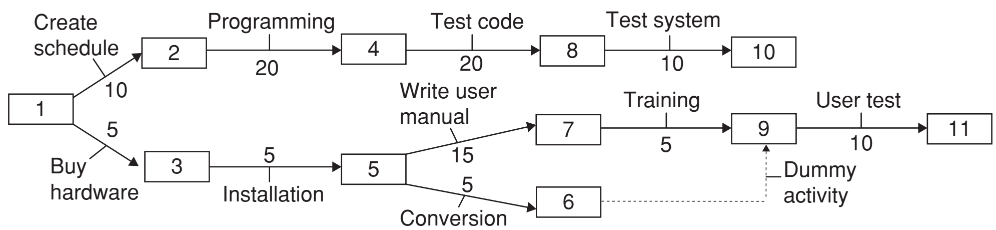
A PERT chart presents a graphic illustration of a project as a network diagram consisting of numbered nodes (either circles or rectangles) representing events, or milestones in the project linked by labelled vectors (directional lines) representing tasks in the project. The direction of the arrows on the lines indicates the sequence of tasks.



In the diagram, shown below the tasks between nodes 1, 2, 4, 8 and 10 must be completed in sequence and are called dependent or serial tasks. The tasks between nodes 1 and 2 and nodes 1 and 3 are not dependent on the completion of one to start the other and can be undertaken simultaneously. These tasks are called parallel or concurrent tasks. Tasks that must be completed in sequence but don't require resources or completion time are represented by dotted lines with arrows and are called dummy activates (Example: dashed arrow linking 6 and 9).

Numbers on the opposite sides of the vectors indicate the time allotted for the task.

The PERT chart is preferred over Gantt chart since it clearly illustrates task dependencies. But on complex projects, PERT chart may be much more difficult to interpret.



Thus in short,

Dependency diagrams can be defined as a formal notation to help in the construction and analysis of complex schedules. Dependency diagrams are drawn as a connected graph of nodes and arrows. Dependency diagrams consists of three elements:

- Event–A significant occurrence in the life of a project.
- Activity–Amount of work required to move from one event to the next.
- Span time–Actual calendar time required to complete an activity.

Software Design

Software design is the process in which requirements are translated into a blue print for constructing the software.

Once software requirements have been analyzed and modelled, software design is the last software engineering action within the modelling activity and sets the stage for construction (code generation and testing).

Architectural design defines the relationship between major structural elements of the software, the architectural styles and design patterns, that can be used to achieve the requirements defined for the system, and the constraints that affect the way in which architecture can be implemented.

The interface design describes how the software communicates with systems that interoperate with it, and with humans who use it.

The component-level design transforms structural elements of the software architecture into a procedural description of software components.

The major goals of the design process are:

- The design must implement all of the explicit requirements contained in the requirements model, and it must accommodate all the implicit requirements, desired by stakeholders.
- The design must be a readable, understandable guide for those who test and subsequently support the software.
- The design should provide a complete picture of the software, addressing the data, functional and behavioral domains from an implementation perspective.

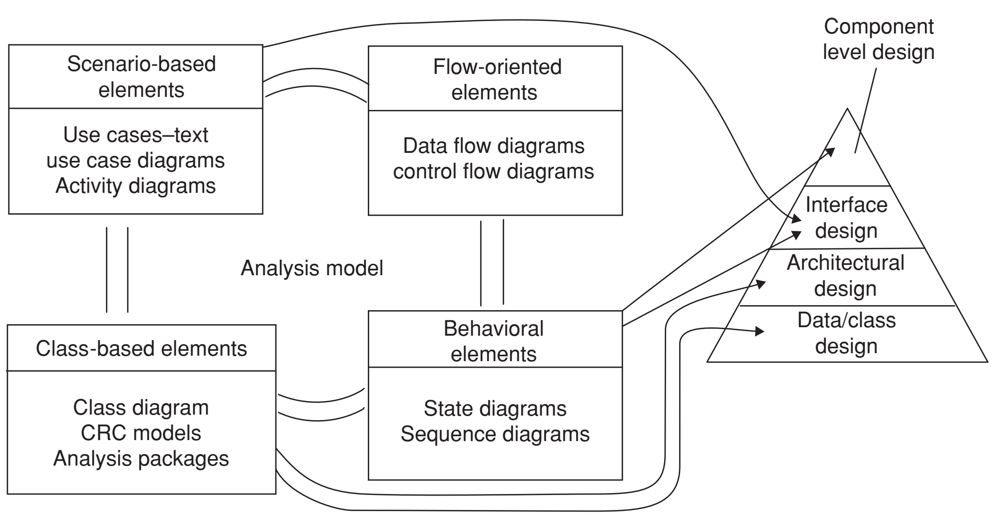


Figure 1 Design model.

Software design sits at the technical kernel of software engineering and is applied regardless of the software process model that is used. In the beginning, once the software requirements have been analyzed and modeled, software design is the last software engineering action within the modeling activity and sets the stage for construction (code generation and testing).

- The data/class design transforms analysis–class models into design class realizations and the requisite data structures required to implement the software.
- The architectural design defines the relationship between major structural elements of the software, the architectural styles and design patterns that can be used to achieve the requirements defined for the system.
- The interface design describes how the software communicates with systems that interoperate with it, and with humans who use it. An interface implies a flow of information (data/control) and a specific type of behavior.
- The component-level design transforms structural elements of the software architecture into a procedural description of software components.

Design Concepts

Important software design concepts:

Abstraction Many levels of abstraction can be posed while considering a modular solution to any problem. At highest level of abstraction, a solution is stated in broad terms and at lower levels, a more detailed description of the solution is provided. At the lowest level of abstraction, the solution is stated in a manner that can be directly implemented.

Architecture Architecture is the structure or organization of program components (modules), the manner in which these components interact, and the structure of data that are used by components.

Patterns The intent of each design pattern is to provide a description that enables a designer to determine:

1. whether the pattern is applicable to current work.
2. whether the pattern can be reused.
3. whether the pattern can serve as a guide for developing a similar, but functionally or structurally different pattern.

Separation of concerns Separation of concerns is a design concept that suggests that any complex problem can be more easily handled if it is subdivided into pieces that can be solved and/or optimized independently.

A concern is a feature or behaviour that is specified as part of the requirement model for the software.

Modularity common manifestation of separation of concerns. Software is divided into separately named and addressable components (modules) that are integrated to satisfy problem requirements.

Information hiding Modules should be specified and designed so that information (algorithm and data) contained within a module is inaccessible to other modules that have no need for such information.

Functional independence Software should be designed in such a way that each module addresses a specific subset of requirements and has a simple interface when viewed from other parts of the program structure.

Functional independence is achieved by developing modules, which can perform a single function.

Refinement Refinement is a process of elaboration, begins with a statement or function defined at a high level of abstraction and then elaborates the original statement, providing more and more details as each successive refinement (elaboration) occurs.

Refactoring Refactoring is the process of changing a software system in such a way that it does not alter the external behaviour of the code (design), yet improves its internal structure.

When software is refactored, the existing design is examined for redundancy, unused design elements, inefficient or unnecessary algorithms, poorly constructed or inappropriate data structures or any other design failures that can be corrected to yield a better design.

Modeling Component Level Design

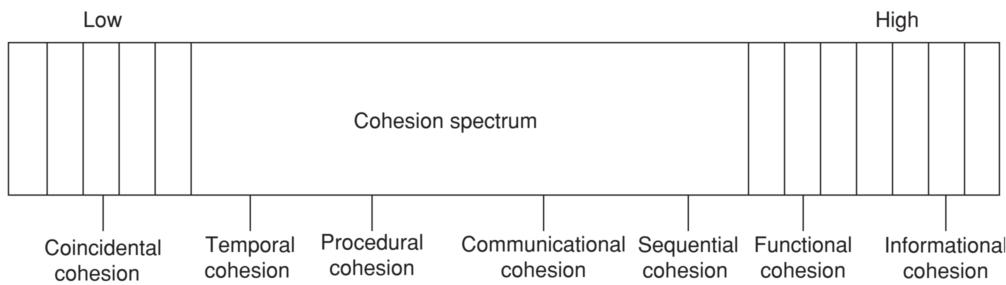
Component level design occurs after the first iteration of architectural design has been completed. At this stage the overall data and program structure of the software has been established.

Component A component is a modular building block for computer software.

Cohesion Cohesion implies that a component or class encapsulates only attributes and operations that are closely related to one another and to the class or component itself. Cohesion is a measure of internal relative strength of a module. It should be more. Different types of cohesion are:

1. **Coincidental cohesion:** If elements of a module are unrelated, then it is coincidental cohesive.
2. **Logical cohesion:** If elements of a module are related, then it is logical cohesion.
3. **Temporal cohesion:** If the elements of a module are elated and the elements are confined to initialization or time, it is temporal cohesion.
4. **Procedural cohesion:** If the elements are confined to one name and if they perform a set of operations, then the module is said to be procedural cohesive.
5. **Communicational cohesion:** If the elements in a module interact through data declared in it, then the module is said to be communicational cohesion.

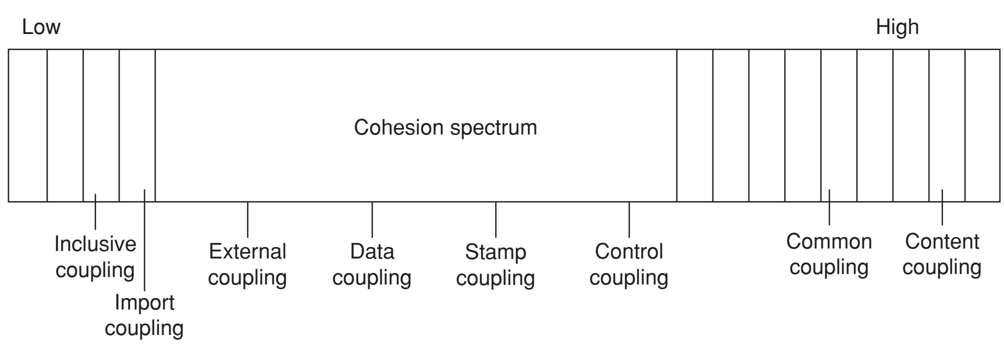
6. **Sequential cohesion:** If the elements are related and if they perform a set of operations in which the output of one operation is the input for another operation.
7. **Functional cohesion:** If the elements are related and if they are confined to one name and if they perform one and only one task, the module is functional cohesive.
8. **Informational cohesion:** If the elements of a module are confined to abstraction, it is informational cohesion.



Note: Cohesion metric should be high.

Coupling Coupling is a qualitative measure of the degree to which classes are connected to one another. As classes and components become more interdependent, coupling increases. In component-level design coupling is to be kept as low as possible. It includes:

1. **Procedural or routine call coupling:** A form of coupling in which modules interact nominally more or less they are almost independent.
2. **Low coupling:** Form of coupling in which modules interact minimally. In extreme case there is no coupling between them.
3. **Inclusion coupling:** A coupling in which source code of one module is included into another module.
4. **Import coupling:** A coupling in which one module is declared in another module for its functionality.
5. **External coupling:** A coupling in which modules interact with modules written by some third party, which may include specific hardware or software.
6. **Data coupling:** Occurs when operations pass long strings of data arguments.
7. **Stamp coupling:** Occurs when a class is declared as a type for an argument of an operation of another class.
8. **Control coupling:** Coupling in which one module controls the order of execution of other module by using flags.
9. **Common coupling:** If the components make use of a global variable, it can lead to uncontrolled error propagation and unforeseen side effects when changes are made.
10. **Content coupling:** Type of coupling in when one module refers to other module, in extreme case, it changes internal structure of other modules for its functionality.



Note: Coupling metric should be low.

Coding

Coding may be

1. The direct creation of programming language source code (e.g., Java, C).
2. The automatic generation of source code using an intermediate design like representation of the component to be built or
3. The automatic generation of executable code using a 'fourth generation programming language' (**e.g.,** VC++).

The principles that guide the coding task are closely aligned with programming style, programming languages and programming methods.

The fundamental principles are:

- Understand the problem you are trying to solve.
- Understand basic design principles and concepts.
- Pick a programming language that meets the needs of the software to be built and the environment in which it will operate.
- Select a programming environment that provides tools that will make the work easier.

Create a set of unit tests that will be applied once the component code is completed.

Characteristics of Good Srs

The characteristics of good SRS are

1. Correctness: The requirements specified in the software should meet, then the SRS is correct.
2. Unambiguous: The SRS is said to be unambiguous if every specified requirement can be interpreted in only one way.
3. Completed: The SRS is said to be complete, if and only if it has all significant requirements, definition of software responses to input data and labels and references to tables, figures and diagrams.
4. Consistent: The SRS is said to be consistent if the individual requirements are not defined in a conflict way and the SRS should be a high level document.
5. Stability: The SRS is said to be stable (or) ranked for the importance if each requirement has a preference. All the requirements may not have same importance; identify the requirements which are essential and requirements having least preference.
6. Verifiable: If each requirement is verifiable then the SRS is said to be verifiable.
7. Modifiable: The SRS is said to be modifiable, if the changes to the requirements can be made easily, consistent.
8. Traceable: Requirements should be clear so that each requirement can be referenced for enhancement, (or) future developments, which makes the SRS traceable.

Validation of SRS Validation of SRS is done to check whether the SRS is reflection of actual requirements and also to check the SRS documents is of good quality.

Testing

Testing is the process of executing a program with the intent of finding an error.

A good test case is one that has a high probability of finding an as-yet-undiscovered error. A successful test is one that uncovers an as-yet-undiscovered error.

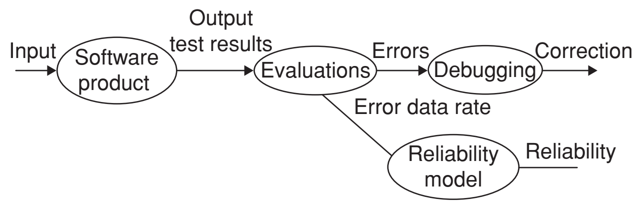


Figure 2 Formal technical review committee (FTR)

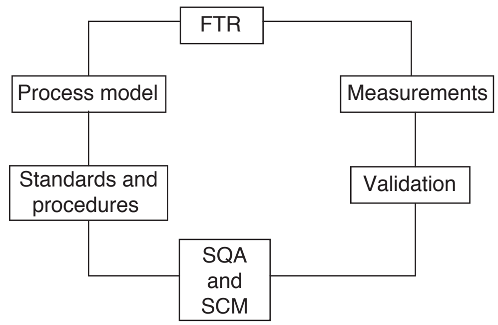

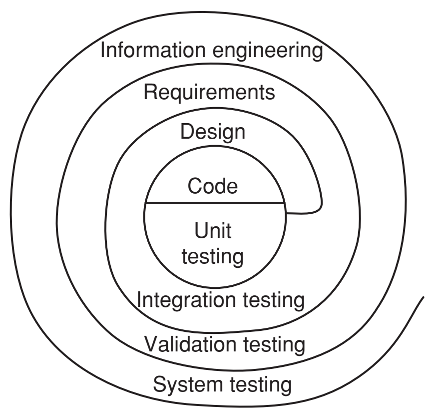

Figure 3 Verification

There are four software testing strategies:

1. Unit testing
2. Integration testing
3. Validation testing
4. System testing

Unit testing

Unit testing concentrates on each unit (e.g., class, component, etc). Unit test focuses on the internal processing logic and data structures within the boundaries of a component. Important control paths are tested to uncover errors within the boundary of the module, using component-level design description as a guide.

Integration testing

Integration testing focuses on design and construction of the software architecture. Integration testing is a systematic technique for constructing the software architecture while at the same time conducting tests to uncover errors associated with interfacing. The objective is to take unit-tested components and build a program structure that has been dictated by design.

- **Top-down integration** Modules are integrated by moving downward through the control hierarchy, beginning with the main control module (main program). Modules subordinate to the main control module are incorporated into the structure in either a depth-first or breadth-first manner.
- **Bottom-up Integration** begins construction and testing with the components at the lowest levels in the program structure.
- **Regression testing** in the context of an integration test strategy, regression testing is the re-execution of some subset of tests that have already been conducted to ensure that changes have not propagated unintended side effects.
- **Smoke testing** is an integration testing approach that is designed as a pacing mechanism for time-critical projects, allowing the software team to assess the project on a frequent basis.

Validation testing

Validation succeeds when software functions in a manner that can be reasonably expected by the customer.

In validation testing, the requirements established as part of requirements modeling are validated against the software that has been constructed.

Software validation is achieved through a series of tests that demonstrate conformity with requirements.

Alpha and beta testing can be used to uncover errors that occur only at the end user.

The alpha test is conducted at the developer's site by a representative group of end users. The software is used in a natural setting by end users in the presence of the developer and the developer records usage problems.

The beta test is conducted at one or more end user sites in the absence of developer. Therefore, beta test is a 'live' application of the software in an environment that cannot be controlled by the developer. The customer records all problems and reports to developer.

System testing

In system testing, the software and other system elements are tested as a whole.

System testing is a series of different tests whose primary purpose is to fully exercise the computer-based system. The types of system tests used for software-based systems are:

- **Recovery testing** is a system test that forces the software to fail in a variety of ways and verifies that recovery is properly performed.
- **Security testing** attempts to verify that protection mechanisms built into a system will protect it from improper penetration.
- **Stress testing** executes a system in a manner that demands resources in abnormal quantity, frequency or volume. A variation of stress testing called sensitivity testing attempts to uncover data combinations within valid input classes that may cause instability or improper processing.
- **Performance testing** is designed to test the run-time performance of software within the context of an integrated system.
- **Deployment testing** also called configuration testing exercises the software in each environment in which it is to operate. It also examines all installation procedures and specialized installation software that will be used by customers, and all documentation that will be used to introduce the software to end users.

Software Testing

The goal of testing is to find errors and a good test is one that has a high probability of finding an error.

The two ways of testing a software:

1. White-box testing (Internal testing)
2. Black-box testing (External testing)

White-box Testing

In white-box testing (also called glass-box testing) of software, tests are conducted to ensure that all internal operations are performed according to specifications and all internal components have been adequately exercised.

White-box testing methods should guarantee that:

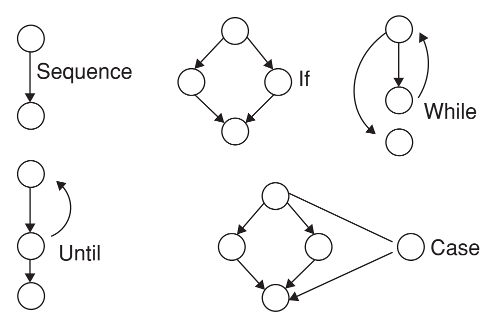
1. All independent paths, within a module are exercised at least once.
2. Exercise all logical decisions on their true or false sides.
3. Execute all loops at their boundaries and within their operational bounds and
4. Exercise internal data structures to ensure their validity.

Basis path testing

Basis path testing is a white-box testing technique. This method enables the test case designer to derive a logical complexity measure of a procedural design and uses this measure as a guide for defining a basis set of execution paths. Test cases derived are guaranteed to execute every statement in the program at least one time during testing.

Flow graphs can be used for better understanding the control flow and thus helps basis path testing to execute every statement in the program at least once.

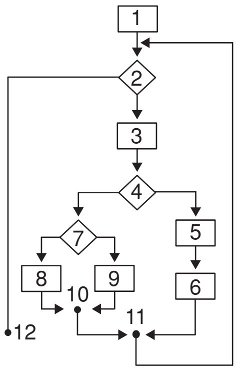
The flow graph symbols are:



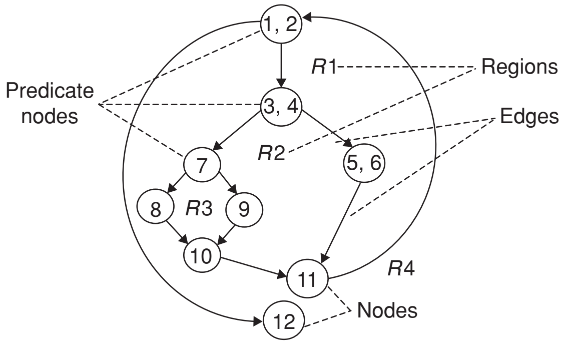
Each circle represents one or more non-branching PDL (Program Design Language) or source code statements.

Example:

Flowchart



Corresponding flow graph is



Each node that contains a condition is called a predicate node. Independent paths (any path through the program that introduces at least one new set of processing statements or a new condition) in the above example are:

Path 1: 1-2-12

Path 2: 1-2-3-4-5-6-11-2-12

Path 3: 1-2-3-4-7-8-10-11-2-12

Path 4: 1-2-3-4-7-9-10-11-2-12

Thus if tests can be designed to force execution of these paths (a basis set), every statement in the program will have been guaranteed to be executed at least one time, and every condition will have been executed on its true and false sides.

Cyclomatic complexity is a software metric that provides a quantitative measure of the logical complexity of a program. When used in the context of basis path testing method, the value computed for cyclomatic complexity defines the number of independent paths in the basis set of a program and provides an upper bound for the number of tests that must be conducted to ensure that all statements have been executed at least once.

Complexity is calculated in one of the three ways:

1. The number of regions of the flow graph corresponds to the cyclomatic complexity. (i.e., four Regions $R1$, $R2$, $R3$, $R4$ in the above case)
2. Cyclomatic complexity $V(G)$ for a flow graph G is defined as $V(G) = E - N + 2$, when E is the number of flow graph edges and N is the number of flow graph nodes (i.e., in the above case, there are 11 edges and 9 nodes. Thus $V(G) = 11 - 9 + 2 = 4$)
3. Cyclomatic complexity $V(G)$ for a flow graph G is also defined as $V(G) = P + 1$, where P is the number of predicate nodes contained in the flow Graph G. In the above flow graph, there are 3 predicate nodes.

$$\therefore \quad V(G) = 3 + 1 = 4$$

Control structure testing

Some of the variations on control structure testing to improve the quality of white-box testing are:

Condition testing

Condition testing is a test-case design method that exercises the logical conditions contained in a program module. This method focuses on testing each condition in the program to ensure that it does not contain errors.

Control Structure Testing

Condition testing

A simple condition is a Boolean variable or a relational expression, possibly preceded with one NOT (¬) operator. A compound condition is composed of two or more simple conditions, Boolean operators and parentheses. The possible types of elements in a condition include a Boolean operator, a Boolean variable, a pair of parentheses (surrounding a simple or compound Boolean condition), a relational operator, or an arithmetic expression.

Dataflow testing

This method selects test paths of a program according to the locations of definitions and use of variables in the program.

Loop testing

Loop testing is a white-box testing technique that focuses exclusively on the validity of loop constructs. Four classes of loop can be defined as:

Simple loops

The following set of tests can be applied to simple loops, where n is the maximum number of allowable passes through the loop.

1. Skip the loop entirely.
2. Only one pass through the loop.
3. Two passes through the loop
4. m passes through the loop where $m < n$
5. $n - 1$, n, $n + 1$ passes through the loop.

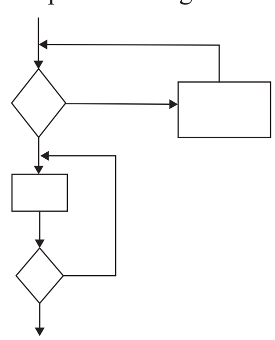


Figure 4 Simple loop.

Nested loops

Here the number of possible tests grows geometrically as the level of nesting increases. This results in an impractical number of tests.

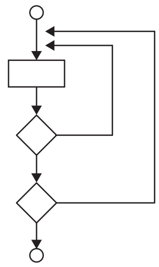

Figure 5 Nested loops.

Concatenated loops

Concatenated loops can be tested using approach of simple loops, if each of the loops is independent of the other. If two loops are concatenated and the loop counter for loop 1 is used as the initial value for loop 2, than the loops are not independent.

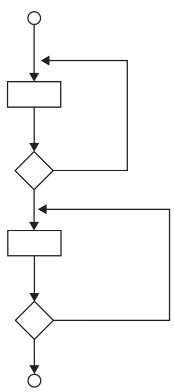

Figure 6 Concatenated loops.

Unstructured loops

Whenever possible, this class of loops should be redesigned to reflect the use of the structured programming constructs.

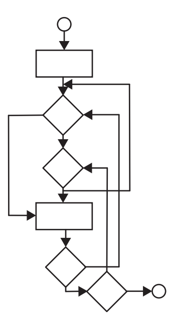

Figure 7 Unstructured loop.

Black-box Testing

Black-box testing, also called behavioral testing, focuses on the functional requirements of the software.

Black-box testing attempts to find errors in the following categories:

1. Incorrect or missing functions
2. Interface errors
3. Errors in data structures or external database access
4. Behaviour or performance errors and
5. Initialization and termination errors

By applying black-box techniques, we derive a set of test cases that satisfy the following criteria:

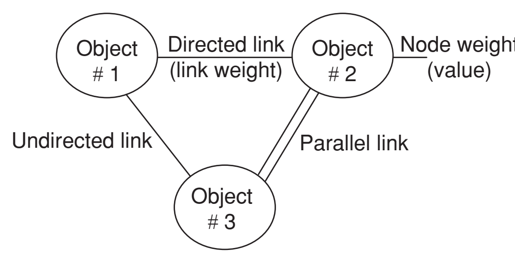
1. Test cases that reduce, by a count that is greater than one, the number of additional test cases that must be designed to achieve reasonable testing.
2. Test cases that tell something about the presence or absence of classes of errors, rather than an error associated only with the specific test at hand.

In graph-based black-box testing methods, software testing begins by creating a graph of important objects and their relationships and then devising a series of tests that will cover the graph so that each object and relationship is exercised and errors are uncovered.

Graph-based testing methods

To accomplish these steps, the software engineer begins by creating a graph – a collection of nodes that represent objects; links that represent the relationships between objects; node weights that describe the properties of a node and link weights that describe some characteristic of a link.

The symbolic representation of a graph is as shown in the figure.



- Nodes are represented as circles connected by links that take a number of different forms.
- A directed link indicates that a relationship moves in only one direction.
- A bidirectional link (symmetric link) implies that the relationship applies in both directions.
- Parallel links are used when a number of different relationships are established between graph nodes.

Equivalence partitioning

is a black-box testing method that divides the input domain of a program into classes of data from which test cases can be derived.

Equivalence partitioning strives to define a test case that uncovers classes of errors, thereby reducing the total number of test cases that must be developed.

Test case design for equivalence partitioning is based on an evaluation of equivalence classes for an input condition. An equivalence class represents a set of valid or invalid states for input conditions.

Boundary value analysis (BVA)

It is developed as a testing technique used to test bounding values since a greater number of error occurring at the boundaries of the input domain than at the centre.

Boundary value analysis is a test case design technique that complements equivalence partitioning. Rather than selecting any element of an equivalence class, BVA leads to the selection of test cases at the 'edges' of the class. BVA derives test cases from the input conditions as well as from the output domain.

Orthogonal array testing

The orthogonal array testing method is useful in finding region faults; an error category associated with faulty logic within a software component.

Orthogonal array testing can be applied to problems in which the input domain is relatively small.

When orthogonal array testing occurs, an Lg orthogonal array of test cases is created. This array has a 'balancing property', i.e., test cases are dispersed uniformly throughout the test doming.

Model-based testing (MBT)

It is a black-box testing technique that uses information contained in the requirements model as the basis for the generation of test cases.

White-box testing is usually performed at the early stages of testing process, while black-box testing tends to be applied during later stages of testing.

Implementation and Maintenance

System Implementation

Implementation is the process of converting a new or a revised system design into an operational one. Major aspects of implementation are conversion, post-implementation review and software maintenance.

There are three types of implementations:

1. Implementation of a computer system to replace a manual system.
2. Implementation of a new computer system to replace an existing one.
3. Implementation of a modified application to replace an existing one using the same computer.

Conversion

Conversion means changing from one system to another. The objective of conversion is to put the tested system into operation, while holding into costs, risks and personal irritation to a minimum.

It involves:

1. Creating computer-compatible files
2. Training the operating staff
3. Installing terminals and hardware

A very important aspect of conversion is not disrupting the functioning of the organization.

File conversion involves capturing data and creating a computer file from existing files.

Post implementation review

Every system requires periodic evaluation after implementation. A post-implementation review measures the system's performance against predefined requirements.

Unlike system testing, which determines where the system fails so that the necessary adjustments can be made, a post-implementation review determines how well the system continues to meet performance specifications. Post-implementation review is done after design and conversion are completed.

Software Project Estimation

Software is the most expensive element of virtually all computer-based systems. For complex, custom systems, a large cost estimation error can make the difference between profit and loss.

Software project estimation is a form of problem solving, and in most cases, the problem to be solved (i.e., developing a cast and effort estimate for a software project) is too complex to be considered in one piece. For this reason, we decompose the problem recharacterizing it as a set of smaller problems.

Problem-based estimation

Lines of code (LOC) and function point (FP) are used in two ways during software project estimation.

1. As an estimation variable to 'size' each element of the software.
2. As baseline metrics collected from past projects and used in conjunction with estimated variables to develop cost and effort projections.

The project planner begins by estimating a range of values of each information domain value. Using the historical data, the planner estimates an optimistic, most likely, and pessimistic size value for each function or count for each information domain value.

The expected value for the estimation variables is computed as

$$S = \frac{\text{optimistic} + 4 * \text{Most likely} + \text{pessimistic}}{6}$$

Empirical estimation models

An estimation model for computer software uses empirically derived formulas to predict effort as a function of LOC

or FP. The model should be tested by applying data collected from completed projects, plugging the data into the model and then comparing actual to predicted results.

Some of the LOC-oriented estimation models are

$E = 5.2 \times (\text{KLOC})^{0.91}$	Walston-Felix model
$E = 5.5 + 0.73 \times (\text{KLOC})^{1.16}$	Bailey-Basili model
$E = 3.2 \times (\text{KLOC})^{1.05}$	Boehm simple model
$E = 5.288 \times (\text{KLOC})^{1.047}$	Doty model for KLOC > 9

The software equation The software equation is a multi-variable model that assumes a specific distribution of effort over the life of a software development project.

$E = [\text{LOC} \times B^{0.333}/P]^3 \times (1/t^4)$

where

E = effort in person – months or person – years

t = project duration in months or years

B = Special spills factor

P = Productivity parameter that reflects overall process maturity and management practices, the extent to which good software engineering practices are used, the level of programming languages used, the state of software environment, the skills and experience of the software team, and the complexity of the application.

Note: B increases slowly as 'the need for integration, testing, quality assurance, and documentation and management skills grows'. For small programs KLOC = 5 to 15, $B = 0.16$.

For programs greater than 70 KLOC, $B = 0.39$

Putnam and Myers suggest a set of equations derived from the software equation.

Minimum development time is defined as

$t_{\min} = 8.14\ (\text{LOC}/P)^{0.43}$ in months for $t_{\min} > 6$ months

$E = 180\ \text{B}\ t^3$ in person – months for $E \geq 20$ person – months

Software Maintenance

Maintenance means restoring something to its original condition.

Maintenance is actually the implementation of the post-implementation review plan.

Maintenance is classified into corrective, adaptive or perfective maintenance.

Corrective maintenance repairs processing or performance failures or make changes because of previously uncorrected problems or false assumptions.

Adaptive maintenance means changing the program function.

Perfective maintenance enhances the performance or modify the programs to respond to the user's additional or changing needs.

About 50–80% of the total system development cost accounts for maintenance. Analysts and programmers spend far more time maintaining programs than they do writing them.

A manufacturer wants to minimize the variation among the products that are produced by maintaining the quality.

User satisfaction = compliant product + good quality + delivery within budget and schedule.

Software Quality Assurance (SQA)

Software Quality is defined as conformance to explicitly stated functional and performance requirements, explicitly documented development standards, and implicit characteristics that are points regarding quality is expected of all professionally developed software. In addition to the above definition some important

1. Software requirements are the foundation from which quality is measured. Lack of conformance to requirements is lack of quality.
2. If software conforms to its explicit requirements but fails to meet implicit requirements, software quality is suspect.

Activities performed by SQA group:

1. Prepares an SQA plan for a project.
2. Participates in the development of the project's software process description
3. Reviews software engineering activities to verify compliance with the defined software process.
4. Ensures that deviations in software work and work products are documented and handled according to a documented procedure.
5. Records any non-compliance and reports to senior management.

Software Reliability

Software reliability is defined as the probability of failure-free operation of a computer program in a specified environment for a specified time.

Measures of reliability and availability:

- A simple measure of reliability is mean-time-between-failure (MTBF).

  MTBF = MTTF + MTTR

  where

  MTTF = mean-time-to-failure

  MTTR = mean-time-to-repair

Although debugging (and related corrections) may be required as a consequence of failure, in many cases the software will work properly after a restart with no other change.

- In addition to a reliability measure, we must develop a measure of availability. Software availability is the probability that a program is operating according to requirements at a given point in time and is defined as

  Availability = [MTTF/(MTTF + MTTR)] × 100%

Software Safety

- Software safety is a software quality assurance activity that focuses on the identification and assessment of potential hazards that may affect software negatively and cause an entire system to fail.

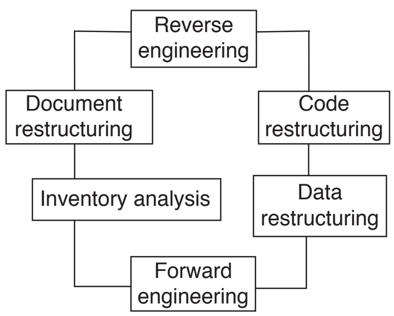
- Software safety examines the ways in which failures result in conditions that can lead to a mishap. That is the failures are evaluated in the context of an entire computer-based system and its environment.

Software Reengineering

Cost of redevelopment is very high compared to development.

The maintenance of existing software can account for over 60% of all effort expended by a development organization, and the percentage continues to rise as more software is produced.

A reengineering process model is shown below:



- Reengineering takes time, costs significant amount of money and absorbs resources that might be otherwise occupied on immediate concerns.
- Reengineering of information systems is an activity that will absorb information technology resources for many years.
- Inventory analysis : The inventory can be nothing more than a spreadsheet model containing information that provides a detailed description of every active application. It should be revisited on a regular cycle.
- Document restructuring : It creates a framework of documentation that is necessary for the long-term support of an application.
- Code restructuring : The source code is analyzed using a restructuring tool. The restricted code is reviewed and tested to ensure that no anomalies have been introduced.
- Data restructuring : It is a full-scale reengineering activity. Current data architecture is dissected and necessary data models are defined.
- Forward engineering : Also called renovation or reclamation, covers design information from existing software and uses this information to alter or reconstitute the existing system in an effort to improve its overall quality.
- Reverse engineering : It is the process of analyzing a program in an effort to extract data, architectural, and procedural design information.

The abstraction level of a reverse engineering process and the tools used to affect it refers to the sophistication of the design information that can be extracted from source code.

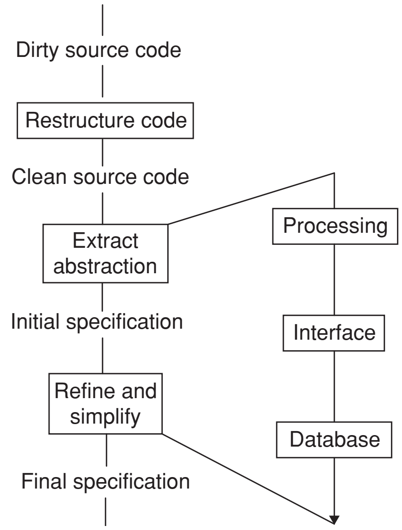


Figure 8 The reverse engineering process.

COCOMO Model

One of the famous model structures used to estimate the software effort is the constructive cost model, which is often called as COCOMO model. COCOMO was developed by Boehm. The model helps in defining the mathematical relationship between the software development time, the effort in man-months and the maintenance effort.

Basic COCOMO is defined as computers software development effort (and cost) as a function of program size. Program size is expressed in estimated thousand lines of code (KLOC) COCOMO is applied to three classes of software projects:

1. Organic projects
2. Semi-detached projects
3. Embedded projects

Organic projects

Organic projects are projects that are having small teams with good working experience with less than rigid requirements.

Semi-detached projects

Semi-detached projects are projects with medium teams having mixed working experience with a mix of rigid and less than rigid requirements

Embedded projects

Project that are developed within a set of tight constraints (hardware, software, operational…)

The general formula of the basic COCOMO model is

$E = a(s)^b$

where

$E \rightarrow$ Represents effort in person-months

$S \rightarrow$ Size of the software development in KLOC

‘a’ and ‘$\rightarrow$’ 5 Values dependent on the development mode

Development Mode	Value of *a*	Value of *b*
Organic	2.4	1.05
Semi-detached	3.0	1.12
Embedded	3.6	1.20

Development time $D = C(E)^d$

People required $(P) = \frac{E}{D}$[count]

Development Mode	Value of *c*	Value of *d*
Organic	2.5	0.38
Semi-detached	2.5	0.35
Embedded	2.5	0.32

For intermediate COCOMO model, the value of coefficient Q and the exponent b are given in the table below:

Development Mode	Value of *a*	Value of *b*
Organic	3.2	1.05
Semi-detached	3.0	1.12
Embedded	2.8	1.20

Exercises

Practice Problems I

Directions for questions 1 to 15: Select the correct alternative from the given choices.

Common data for questions 1 and 2: Consider the following payroll program that prints a file of employees and a file of information (transaction file) for the current month and for each employee.

In addition, the program updates the employee file, and produces an earnings report, a deduction report and analysis report. The application is capable of interactive command to print an individually requested pay slip. It also processes a file containing details of payment. This program can give printout of pay slips when they are requested individually. The weight table is shown below:

	Simple	Average	Complex
No. of inputs	3	4	6
No. of outputs	4	5	7
No. of enquiries	3	4	6
No. of files	7	10	15
No. of interfaces	5	7	10

1. What is the unadjusted function point for the given payroll program?
(A) 60 (B) 62
(C) 68 (D) 72

2. From the above problem, find adjusted function point where $F4 = 4$, $F5 = 3$, $F12 = 2$, $F14 = 5$?
(A) 49 (B) 62
(C) 82 (D) 90

Common data for questions 3 and 4: The size estimated for software of a certain project is 45,000 lines of code. The average salary paid per engineer is ₹20,000 per month.

3. Calculate the effort required if the software is of organic type.
(A) 100 pm (B) 120 pm
(C) 130 pm (D) 140 pm

4. Calculate the cost required if the software is of semi-detached type.
(A) 113000 (B) 213000
(C) 315000 (D) 326515

5. A 40 KDSI embedded program for teleprocessing is to be developed. Estimate the time required for the project using basic COCOMO model.
(A) 12 pm (B) 14 pm
(C) 16 pm (D) 18 pm

6. Consider the following code:

```
begin
If (x ≤ 0) then x = 0 – x;
a = x;
end
```

Lata wants to test the program with test data. What are the sufficient values to execute both branches of the decision box?
(A) $x = 0, 4$ (B) $x = 0, -4$
(C) $x = 1, 4$ (D) $x = 0, -1$

7. What is the maintainability of a software with average number of days of repairing code is 10, adapting code is 20 and for enhancing code is 10?
(A) 6.3 (B) 12.5
(C) 32.6 (D) 40

8. Consider a Java program and the SLOC is given as 1000.

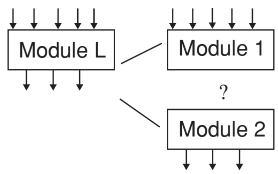
Class A

```
{
int x(int a);
int y(int b);
int z(int c);
}
```

What is the modularity?
(A) 0.001 (B) 0.002
(C) 0.003 (D) 0.004

9. Raj has written a program to add two numbers. Assuming a 32-bit representation for an integer, to exhaustively test his program, the number of test cases required are
(A) 2^8 (B) 2^{16}
(C) 2^{32} (D) 2^{64}

10. The module of the length 'L' is split up in two sub modules, module 1 and module 2, each of length $\frac{L}{2}$. How many links between the sub modules are allowed so that we maintain the value of information flow metric at same level?



(A) 2.4 (B) 3.6
(C) 4.8 (D) 1.2

11. The three estimates of the code size for a particular application for geometric analysis were most optimistic 4600, most likely 6900, most pessimistic is 8600. The value of estimated size that should be taken is
(A) 4600 (B) 6800
(C) 6900 (D) 8600

12. For an application of developing new operating system the KLOC is 34.5. What is the number of person-month (effort) best estimated using the intermediate COCOMO model?
(A) 126 (B) 130
(C) 158 (D) 196

13. For a real-time software systems the KLOC is 28.2. What is the effort in person–month calculated by using basic COCOMO model?
(A) 146 (B) 198
(C) 220 (D) 248

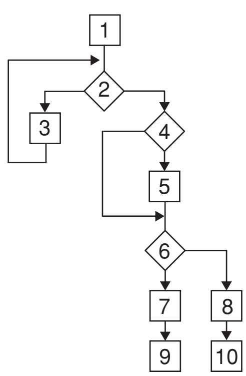
14. For inventory management system the KLOC is 25.5, what is the effort in person-month, using basic COCOMO model?
(A) 110 (B) 113
(C) 120 (D) 140

15. For the above, what is the estimated project duration in months?
(A) 6 (B) 8
(C) 10 (D) 13

Practice Problems 2

Directions for questions 1 to 16: Select the correct alternative from the given choices.

Common data for questions 1 and 2: Consider the below flow graph:



1. What is the number of paths to node 9?
(A) 2 (B) 3
(C) 4 (D) 5

2. What is the reachability measure?
(A) 1.8 (B) 2.8
(C) 2.4 (D) 2.1

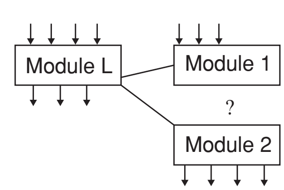
Common data for questions 3 and 4: For a software project the estimation is carried out by the Delphi method. Below table shows 5 experts with estimates:

Estimate	Pessimistic	Most likely	Optimistic
Expert 1	30	50	60
Expert 2	10	55	75
Expert 3	20	50	70
Expert 4	30	60	70
Expert 5	25	40	75

3. What is the average estimate?
(A) 48.3 (B) 49.4
(C) 50.8 (D) 56.7

4. What is the average variance?
(A) 5.0 (B) 6.7
(C) 7.8 (D) 8.3

5. The module of length L is split up into two sub modules (module-1 and module-2) each of length $\frac{L}{2}$. How many links between the sub modules exists so that we maintain the value of the information flow metric at the same level as found in the original module?



(A) 3 (B) 4
(C) 5 (D) 6

6. Constructive cost model is used to estimate
(A) Effort in man-month.
(B) Effort and schedule based on the size of the software.
(C) Size and duration based on the effort of the software.
(D) None of these

7. The theoretic concept that will be useful in software testing is
(A) Hamiltonian circuit
(B) Cyclomatic number
(C) Eulerian cycle
(D) None of these

8. Testing method that is normally used as the acceptance test for a software system is
(A) Regression testing
(B) Integration testing
(C) Unit testing
(D) None of these

9. Acceptance testing is
(A) The manner in which each component functions with other component of the system are tested.
(B) Running the system with given data by the actual user.
(C) The process of testing the changes in a new system or an existing system.
(D) None of these

10. Which of the following statements is true?
(A) Use of independent path testing criterion guarantees execution of each loop in a program under test more than once.
(B) Validation is the process of evaluating software at the end of the software development to ensure compliance with the software requirements.
(C) Statement coverage cannot guarantee execution of loops in a program under test.
(D) None of these

11. The size estimated for software of a certain project is 40,000 lines of code. The average salary paid per engineer is ₹15,000 per month. Calculate the cost required if the software is of organic type.
(A) 1,60,000
(B) 2,20,000
(C) 7,90,000
(D) 2,25,000

12. The size estimated for a software project is 35 Kloc. The average salary paid per engineer is ₹25,000 per month. Calculate the cost required if the software is of semi-detached type.
(A) 3,07,500
(B) 3,17,500
(C) 3,69,952
(D) 2,45,000

13. Which of the following statements is false?
(A) The cyclomatic complexity of a module is the number of decisions in the module plus one where a decision is effectively any conditional statement in the module.
(B) A direct flow of control in flow chart representing the lowest cyclomatic complexity.
(C) The reasonable limit of the cyclomatic complexity measure is 10.
(D) The cyclomatic complexity depends on the number of statements in the flowchart.

14. Which of the following is true regarding software testing?
(A) Software testing techniques are most effective if applied immediately after requirement specification.
(B) Software testing techniques are most effective if applied immediately after design.
(C) Software testing techniques are most effective if applied after coding.
(D) Software testing methods are most effective if applied after integration.

Common data for questions 15 and 16: A software project involves execution of 4 activities A_1, A_2, A_3, and A_4, of duration 11, 7, 8 and 3 days respectively. A_1 is the first one and needs to be completed before any other activity can commence. Activity A_2 and A_3 can be executed in parallel. Activity A_4 cannot commence until both A_2 and A_3 are completed.

15. Find the critical path of the above project.
(A) $A_1 - A_2 - A_4$
(B) $A_1 - A_3 - A_4$
(C) $A_1 - A_2 - A_3 - A_4$
(D) None of these

16. Find the slack time of the project.
(A) 0
(B) 1
(C) 12
(D) 13

Previous Years' Questions

1. The coupling between different modules of a software is categorized as follows:

I. Content coupling

II. Common coupling

III. Control coupling

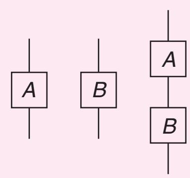
IV. Stamp coupling

V. Data coupling

Coupling between modules can be ranked in the order of strongest (least desirable) to weakest (most desirable) as follows: **[2009]**

(A) I-II-III-IV-V (B) V-IV-III-II-I
(C) I-III-V -II-IV (D) IV-II-V -III-I

2. The cyclomatic complexity of each of the modules *A* and *B* shown below is 10. What is the cyclomatic complexity of the sequential integration shown below? **[2010]**



(A) 19 (B) 21
(C) 20 (D) 10

3. A company needs to develop digital signal processing software for one of its newest inventions. The software is expected to have 40000 lines of code. The company needs to determine the effort in person-months needed to develop this software using the basic COCOMO model. The multiplicative factor for this model is given as 2.8 for the software development on embedded systems, while the exponentiation factor is given as 1.20. What is the estimated effort in person months? **[2011]**

(A) 234.25 (B) 932.50
(C) 287.80 (D) 122.40

4. The following is the comment written for a *C* function.

/ * This function computes the roots of a quadratic equation $ax \wedge 2 + bx + c = 0$. The function stores two real roots in * root 1 and * root 2 and returns the status of validity of roots. It handles four different kinds of cases.

(i) When coefficient '*a*' is zero irrespective of discriminant.

(ii) When discriminant is positive.

(iii) When discriminant is zero.

(iv) When discriminant is negative.

Only in case (ii) and (iii), the stored roots are valid. Otherwise 0 is stored in the roots. The function returns 0 when the roots are valid and −1 otherwise.

The function also ensures root1 > = root2

int get_QuadRoots (float *a*, float *b*, float *c*, float * root1, float * root 2); */

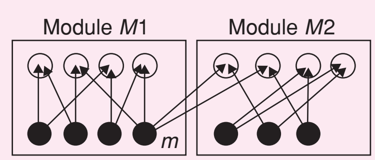
A software test engineer is assigned the job of doing black box testing. He comes up with the following test cases, many of which are redundant.

Test Case	Input Set			Expected Output Set		
	a	*b*	*c*	root1	root2	Return value
*T*1	0.0	0.0	7.0	0.0	0.0	–1
*T*2	0.0	1.0	3.0	0.0	0.0	–1
*T*3	1.0	2.0	1.0	–1.0	–1.0	0
*T*4	4.0	–12.0	9.0	1.5	1.5	0
*T*5	1.0	–2.0	–3.0	3.0	–1.0	0
*T*6	1.0	1.0	4.0	0.0	0.0	–1

Which one of the following options provide the set of non-redundant tests using equivalence class partitioning approach from input perspective for black-box testing? **[2011]**

(A) *T*1, *T*2, *T*3, *T*6 (B) *T*1, *T*3, *T*4, *T*5
(C) *T*2, *T*4, *T*5, *T*6 (D) *T*2, *T*3, *T*4, *T*5

5. The following figure represents access graphs of two modules *M*1 and *M*2. The filled circles represent methods and the unfilled circles represent attributes. If method *m* is moved to module *M*2 keeping the attributes where they are, what can we say about the average cohesion and coupling between modules in the system of two modules? **[2013]**



(A) There is no change
(B) Average cohesion goes up but coupling is reduced
(C) Average cohesion goes down and coupling also reduces.
(D) Average cohesion and coupling increase.

Common data for questions 6 and 7: The procedure given below is required to find and replace certain characters inside an input character string supplied in array *A*. The characters to be replaced are supplied in array 'oldc', while their respective replacement characters are supplied in array 'newc'. Array *A* has fixed length of five characters, while arrays 'oldc' and 'newc' contain three characters each.

However, the procedure is flawed.

```
void find_and_replace (char *A, char
*oldc, char *newc) {
for (int i = 0; i <5; i++)
for (int j=0; j<3; j++)
if (A[i] == oldc[j]) A[i] = newc[j];
}
```

The procedure is tested with the following four test cases.

1. oldc = “abc”, newc = “dab”
2. oldc = “cde”, newc = “bcd”
3. oldc = “bca”, newc = “cda”
4. oldc = “abc”, newc = “bac”

6. If array *A* is made to hold the string “abcde”, which of the above four test cases will be successful in exposing the flaw in this procedure? **[2013]**

(A) None (B) 2 only
(C) 3 and 4 only (D) 4 only

7. The tester now tests the program on all input strings of length five consisting of characters ‘*a*’, ‘*b*’, ‘*c*’, ‘*d*’ and ‘*e*’ with duplicates allowed. If the tester carries out this testing with the four test cases given above, how many test cases will be able to capture the flaw? **[2013]**

(A) Only one (B) Only two
(C) Only three (D) All four

8. In the context of modular software design, which one of the following combinations is desirable? **[2014]**

(A) High cohesion and high coupling
(B) High cohesion and low coupling
(C) Low cohesion and high coupling
(D) Low cohesion and low coupling

Test

Information System, Software Engineering

Time: 60 min.

Directions for questions 1 to 30: Select the correct alternative from the given choices

1. For a COCOMO model, organic projects are:
(A) Projects having small teams with good experience, working with less than rigid requirements.
(B) Projects having medium teams with mixed experience, working with more rigid requirements.
(C) Projects developed with a set of tight constraints.
(D) None of these

2. Which of the following statements is true?
(A) Basic COCOMO is good for quick estimate of software cost.
(B) COCOMO applies to three classes of software projects; organic, semi-detached and embedded.
(C) COCOMO does not account for differences in hardware constants, personal quality and experiences, etc.
(D) All the above

3. The first step in system analysis is
(A) software requirement analysis.
(B) software requirement specification.
(C) system design.
(D) information gathering.

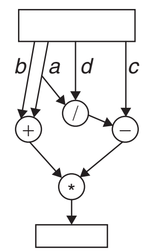
4. Questionnaire consists of
(A) qualitative data.
(B) quantitative data.
(C) Either (A) or (B)
(D) forms and documents.

5. The assessment of an intangible benefit is
(A) directly measurable.
(B) done by discussion amongst users of information system.
(C) irrelevant.
(D) done by discussion amongst the developers.

6. External entities in a DFD may be a
(A) source of input data only.
(B) destination of results only.
(C) source of input data and destination of results.
(D) data store.

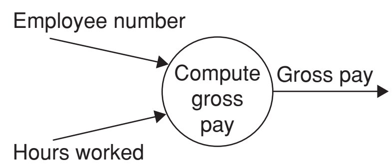
7. A context diagram
(A) is a DFD which gives an overview of the system.
(B) is a DFD that gives details of the system.
(C) is not used in DFDs.
(D) do not allow levelling of DFDs.

8. Consider the DFD below; derive an expression from the given data:



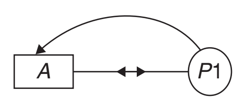
(A) $c - (a + b) * (a/d)$ (B) $a + b/d - (c * b)$
(C) $(a + b) * ((a/d) - c)$ (D) $(a + b) * (c + (a/d))$

9. Consider the following DFD:



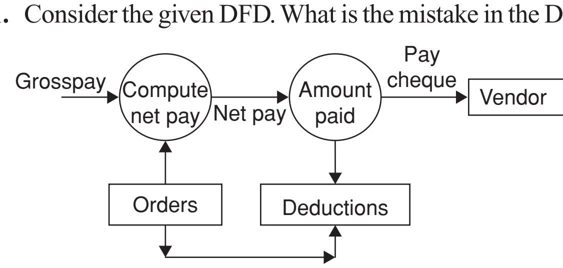
(A) It calculates the gross pay.
(B) The process is specified incorrectly.
(C) Insufficient data flow.
(D) Data flow diagrams are not used to specify these kind of computations.

10.



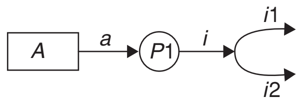
Which of the following is correct for above DFD?
(A) The given DFD is correct.
(B) A DFD cannot have arrows pointing in opposite directions.
(C) Data cannot flow from external entity to a data store.
(D) Data cannot flow from a data store to an external entity.

11. Consider the given DFD. What is the mistake in the DFD?



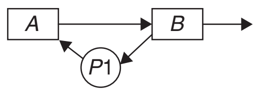
(A) A data flow cannot connect two processing steps.
(B) A data flow cannot connect two distinct data stores.
(C) Data stores cannot communicate with a process.
(D) Data flow cannot connect two distinct external entities.

12.



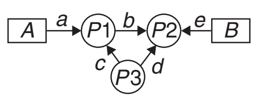
The mistake in above DFD is
(A) a data flow cannot be given two names.
(B) a data flow that has crossing lines.
(C) a DFD which forms loop.
(D) there are no mistakes in the DFD.

13.



Consider the above DFD. What is the mistake?
(A) The DFD forms a loop here.
(B) The DFD is correct.
(C) DFD does not allow communication among two external entities.
(D) DFD does not allow data flow among two data stores.

14. Consider the below DFD. What is the mistake?



(A) Process $P2$ is not designed properly.
(B) Process $P1$ is not designed properly.
(C) Process $P3$ is not designed properly.
(D) The external entities are not properly defined.

15. A good data flow diagram should have the following:
(A) A process which is a pure decision
(B) A DFD must be developed bottom up with higher levels giving more details
(C) Data flow should not act as signals to activate or initiate process
(D) All the above

16. The first phase of software development is
(A) Requirements Analysis
(B) Design
(C) Coding
(D) Testing

17. The lowest level of decomposition for a data flow diagram is
(A) primitive DFD
(B) unit DFD
(C) context DFD
(D) level 0 DFD

18. What is an important information while writing an SRS?
(A) Nature of SRS
(B) Characteristics of SRS
(C) Environment of SRS
(D) All of these

19. Which of the following is not an estimation metric for project size?
(A) LOC
(B) Function Point
(C) Feature Point
(D) None of the above

20. Human effort for developing a software project is measured in
(A) Dollars
(B) Person-Month
(C) Refects
(D) KLOC

21. Flight control software belongs to the following mode (as in basic COCOMO model):
(A) Organic mode
(B) Semi-detached mode
(C) Embedded mode
(D) None of the above

22. A transaction processing system with fixed requirements for terminal hardware and database software belongs to one of the following modes (in basic COCOMO model):
(A) Organic mode
(B) Semi-detached mode
(C) Embedded mode
(D) None of the above

23. In a software project, COCOMO is used to estimate
(A) effort and duration based on the size of the software.
(B) size, effort and duration based on the cost of the software.
(C) size and duration based on the effort of the software.
(D) effort and cost based on the duration of the software.

24. The maximum effort distribution in phases of software development is
(A) Requirement analysis
(B) Design phase
(C) Coding
(D) Testing

25. The minimum error distribution in the period of software development is in
(A) Requirement analysis
(B) Design phase
(C) Coding
(D) Testing

26. Basic Relation of COCOMO model is
(A) $E = (a * b)*(\text{KLOC})$
(B) $E = a * (\text{KLOC}^b)$
(C) $E = a * (\text{KDL})*b$
(D) $E = a/\text{KLOC}^b$

27. The extent to which the software can continue to operate correctly despite the input of invalid data is called as:
(A) Reliability
(B) Robustness
(C) Fault-tolerance
(D) Portability

28. Which of the following statement is false?

(A) The data flow diagram is presented in hierarchical fashion.

(B) Data flow modeling is a core modeling activity in structured analysis.

(C) Data flow diagram is formal part of UML.

(D) Data flow modeling depicts control flow.

29. For which of the following practices does requirements engineering provide appropriate mechanisms and tools?

(A) Analyzing need and validating the specification.

(B) Ambiguous specification of the solution.

(C) Risk Assessment.

(D) Implementing the system.

30. Which of the following is a common method of requirements elicitation?

(A) Transactional Analysis

(B) Observation

(C) Practical considerations

(D) Web accessibility

Answer Keys

1. A	**2.** D	**3.** D	**4.** C	**5.** B	**6.** C	**7.** A	**8.** C	**9.** C	**10.** B

Mock Test I

Number of Questions: 65 **Total Marks: 100**

Wrong answer for MCQ will result in negative marks, (–1/3) for 1 Mark Questions and (–2/3) for 2 Marks Question.

General Aptitude

Number of Questions: 10 **Section Marks: 15**

Direction for question 1: Fill in the blank with the suitable word/phrase:

1. There are ________candidates opting for Home Science today as a course of study at the college level.

(A) smaller (B) less
(C) fewer (D) lesser

Directions for questions 2 and 3: Select the correct alternative from the given choices.

2. The average weight of a class increases by 1 kg, when *A* joins the class. Later when *B* also joins, the average weight further increases by 1/2 kg. If the number of students now in the class is 14, the difference in the weights of *A* and *B* _______.

3. Every Saturday evening from 6 pm to 7 pm a game known as "FAMILY FORTUNES" is telecast on '*XTV*' channel. The mode of the game is as follows.

A table containing prices of different articles is present on the monitor. The anchor asks questions regarding the prices of different articles. If you are able to answer these questions correctly, the corresponding article is yours.

Be the lucky winner by answering the questions that follow the table given below:

2500	3000	1500	3500
2750	1750	3200	2800
2400	3600	4000	2200
1800	1200	1600	2250
3800	3400	3100	2000

A discount of 10% is offered on 'Ultra Microwave Oven' and in the above price table, the list price and the sale price of the above said article are adjacent to each other, not necessarily in the same order. What is its sale price?

(A) ₹4000 (B) ₹3600
(C) ₹1800 (D) ₹2000

Direction for question 4: Select the statement in which the underlined word is used correctly:

4. (A) These insects **adapted** themselves very easily to new environments.
(B) That woman has **adapted** a child from an orphanage.
(C) That Telugu family **immigrated** to Australia last year.
(D) People who have **emigrated** to the U.S. have had to deal with tougher labour laws.

Directions for question 5: Select the correct alternative from the given choices.

5. In a certain code language, if REPTILE is coded as 49 and CROCODILE is coded as 81, then how is ALLIGATOR coded in that language?

(A) 95 (B) 100
(C) 49 (D) 81

Direction for question 6: Out of the following four sentences, select the most suitable sentence with respect to grammar and usage:

6. (A) We took a month and a few days to get acclimated to our new teacher, who is from Baroda.
(B) We will take month and few days to get acclimated to our new teacher, who is from Baroda.
(C) We have taken month and a fewer days to get acclimated to our new teacher, who is from Baroda.
(D) We took a month few days to get acclimated to our new teacher, who is from Baroda.

Directions for question 7: Select the correct alternative from the given choices.

7. If $0 < x < 1$ and $1 + 3x + 5x^2 + 7x^3 + 9x^4 + \ldots \infty = 3$, then the value of x is ____.

(A) 1/2 (B) 1/3
(C) 1/4 (D) 1/5

Direction for question 8: In the following question, the first and the last sentences of a passage are in order and numbered 1 and 6. The rest of the passage is split into 4 parts and numbered as 2, 3, 4 and 5. These 4 parts are not arranged in the proper order. Read the sentences and arrange them in a logical sequence to make a passage and choose the correct sequence from the given order:

8. (1) A classic example of how the "get what you want by helping others get what they want" approach works is the result that a major automaker got when it came out with a new design.
(2) After all, the person turning the wrench knows more about the way it really works on the assembly line than the engineers who designed the wrench.
(3) Before making these changes, the management asked the employees who would actually be

building the new vehicles whether they had any ideas for making the assembly lines more effective.

(4) The workers had dozens of marvelous ideas.

(5) This design necessitated the construction of new plants and the retooling of existing ones.

(6) First, the employees explained that when they had to go down the steps into the pit to work on the underside of a car, they sometimes slipped and fell, injuring themselves.

(A) 5, 3, 4, 2 (B) 3, 4, 2, 5
(C) 2, 5, 4, 3 (D) 4, 3, 2, 5

Directions for questions 9 and 10: Select the correct alternative from the given choices.

9. In a parking lot six buses are parked in front of bus number 25 and fifteen buses are parked behind bus number 45. If six buses are parked between bus numbers 25 and 45, then how many buses are there in the parking lot?

(A) 29 (B) 26
(C) 15 (D) Cannot be determined

10. Jane Davis, founder of Get Into Reading, which has helped Clare Ross so much, discovered the healing power of books by accident. An English lecturer at Liverpool University, England, she also taught literature courses in her community. In the process she discovered that people derived consolation from great writers and the support network the group provided. So she set up Get Into Reading, which now has more than 135 groups.

Which of the statement(s) below is/are logically valid and can be inferred from the above statements?

(i) Reading gives multiple benefits, both unexpected and wholesome.

(ii) Reading helps everyone to set up an association like Get Into Reading.

(iii) Reading is just a waste of time which makes one hope for an unattainable goal.

(iv) Reading gives not only help from great writers but also support from other sources.

(A) (i) and (iii) (B) (i) and (iv)
(C) (ii) and (iii) (D) (ii) and (iv)

COMPUTER SCIENCE ENGINEERING

Number of Questions: 55 **Section Marks: 85**

Directions for questions 11 to 65: Select the correct alternative form the given choices

11. One of the eigenvectors of the matrix

$$A = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 2 & 1 \\ 2 & 0 & 3 \end{bmatrix} \text{ is \_\_\_\_\_}$$

(A) $\begin{bmatrix} 4 \\ 3 \\ -2 \end{bmatrix}$ (B) $\begin{bmatrix} 2 \\ 2 \\ -2 \end{bmatrix}$

(C) $\begin{bmatrix} 3 \\ 4 \\ -2 \end{bmatrix}$ (D) $\begin{bmatrix} -3 \\ -3 \\ -3 \end{bmatrix}$

12. The number of edges in a bipartite graph with 11 vertices should be at most _____

(A) 11 (B) 20
(C) 30 (D) 44

13. Which of the following is NOT a valid identity for any three arbitrary events A, B and C of a sample space?

(A) $P\left(\dfrac{\overline{A}}{B}\right) = 1 - P(A/B)$

(B) $P(A \cap B) = P(A)\, P(B/A)$

(C) $P((A \cup B)/C) = P(A/C) + P(B/C) - P((A \cap B)/C)$

(D) None of these

14. If the number of telephone calls coming to a telephone exchange follows Poisson distribution with an average of 3 calls per hour, then the probability that the number of telephone calls coming to the telephone exchange in one hour exceeding 3 is _____

(A) 0.3528 (B) 0.6472
(C) 0.2341 (D) 0.7659

15. If $f(x) = 2x$, $g(x) = 3x^2$ and $h(x) = 3$ and (fogoh) (x) exists, then the value of (fogoh) (3) is _____

16. Which of the following algorithm can be used to sort the numbers 1, 2, 3, ..., 99, in $O(n)$ time?

(A) Merge sort
(B) Quick sort
(C) Heap sort
(D) Radix sort

17. Consider the following statements:

I. The minimum number of edges in a connected graph which is not cyclic on 'n' vertices is $(n - 1)$.

II. A simple connected graph with 'n' nodes has maximum edges.

Which of the following is TRUE?

(A) Only I
(B) Only II
(C) Both I and II
(D) Neither I nor II

$$n\frac{(n-1)}{2}$$

18. A disk has the following parameters:
Number of tracks = 360
Number of blocks per track = 360
Disk rotates 600 RPM
What is the Latency?
(A) 5 seconds (B) 0.5 seconds
(C) 0.05 seconds (D) 0.005 seconds

19. Which of the following is TRUE?
I. A B-tree of order 3, constructed with *n*-elements which are in ascending order leads to maximum number of Node splits.
II. A B^+-tree of order 3, constructed with *n*-elements which are in descending order leads to maximum number of Node Splits.
(Assume value of '*n*' upto 10 elements)
(A) I only (B) II only
(C) Both I and II (D) Neither I nor II

20. Which of the following is always TRUE?
I. If a program runs on a processor with a higher frequency, then it implies that the processor always executes more number of instructions per second than a low frequency processor.
II. If a processor executes more number of instructions per second then it implies that the processor always finishes a program faster than a processor which executes fewer instructions per second.
(A) I only (B) II only
(C) Both I and II (D) Neither I nor II

21. A machine has 5-stage pipeline, which uses delay slots to handle control dependencies. If the dependencies are resolved in the 3^{rd} stage then the number of delay slots needed to ensure correct operation is ___________.

22. A language L consists of all binary strings beginning with a '1' such that when its value is converted to decimal, is divisible by '3'. Then which of the following is TRUE?
(A) L can be recognized by a Deterministic Finite Automata.
(B) L can be recognized by a Non-deterministic finite automata but not by deterministic finite automata.
(C) L can be recognized by a deterministic push-down automata but not by a finite automata.
(D) The language L cannot recognized by any push down automata.

23. Which of the following problem is decidable?
(A) A Context free language L is regular or not.
(B) Complement of a CFL is CFL or not.
(C) Finding whether a given CFL is empty or not.
(D) Finding whether the intersection of two CFLs is empty or not.

24. Which of the following is TRUE about socket programming?
I. The accept( ) socket call returns the non-negative file descriptor of the accepted socket (if there is no error).
II. The return value of receive( ) specifies the number of bytes read from or if the socket was closed or an error was encountered.
III. In socket programming close( ) and shut down( ) functions operate in same way.
(A) I only (B) I, II only
(C) I, II, III (D) II only

25. Which of the following is FALSE about the connecting device 'Repeater'?
(A) A Repeater is used to connect segments of a LAN.
(B) A Repeater can connect two LANs of different protocols.
(C) A Repeater forwards every frame as it has no filtering capability.
(D) A Repeater is a generator not an amplifier.

26. Using Caesar Cipher with key = 10, what is the encrypted message of "GATECS"?
(A) SCETAG (B) AGETSC
(C) WQJUSI (D) QKDOMC

27. The binding takes place at, which of the following?
(I) language design time
(II) compile time
(III) load time
(IV) link time (or) run time
(V) language implementation time
(A) (II), (III), (IV) (B) (II), (III), (IV), (V)
(C) (I), (II), (III), (IV) (D) All the above

28. Consider the following program:
```
var x;
function fun1( )
{
    var x1 = 20;
    document.write (∀x = ∀ + x);
}
function fun2( )
{
    var x ;
    x = 10;
    fun1( );
}
x = 5
fun2( );
```
Using static scoping what is the value of *x* printed when fun 2( ) is called?
(A) 5 (B) 10
(C) 20 (D) shows error

29. Number of binary trees that can be formed with 3 elements is ______

30. The root directory of the file system should be placed at
(A) Anywhere on the disk
(B) Fixed location on the disk

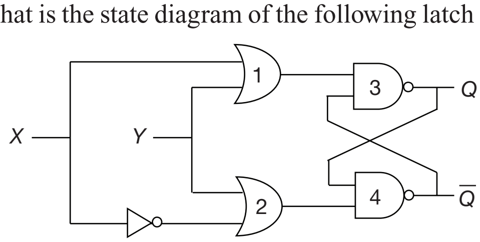
(C) Fixed location on the primary memory.
(D) None of the above

31. In a Round-Robin scheduling, if time Quantum and Process switch takes equal amount of time, then the CPU efficiency will be
(A) 75%
(B) 50%
(C) 65.5%
(D) Depending on the number of processes in the system

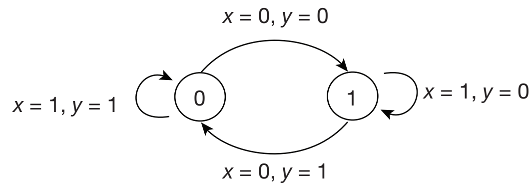
32. Which of the following statements is FALSE?
(A) Type incompatibilities between actual and formal parameters are detected at compile time.
(B) Array subscript out of range is detected at run time.
(C) Multiple declarations of a variable leads to compile time error.
(D) None of the above

33. Consider the following program
```
void fun( )
{
    int a, b, c, d;
:
:
:
            for ( ) - (I)
              {
                int b, c, d;
                    :
                    :
                      for ( ) - (II)
         {
           int c,d, x, y;
           ____ // line (I)
         }
              }
}
```
Which of the following variables are visible at line (I)?
(A) c, d, x, y of for (II); b, c, d of for (I); a, b, c, d of fun ( )
(B) c, d, x, y of for (II)
(C) c, d, x, y of for (II); b of for (I); a of fun ( )
(D) c, d, x, y of for (I); b of for (II); a, b, c, d of fun ( )

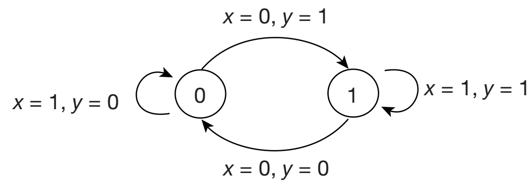
34. What is the state diagram of the following latch circuit?



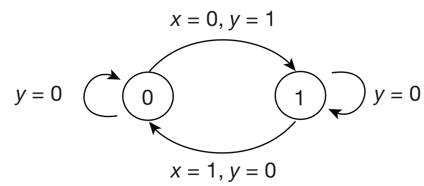
(A)



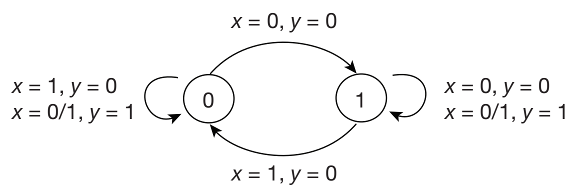
(B)



(C)



(D)



35. Consider the boolean function,
$F(a, b, c) = \pi M(2, 5)$
Then minimum SOP (Sum of Products) form of F is:
(A) $a^1 c + b^1 c^1 + ab$ (B) $a^1 b^1 + bc + ac^1$
(C) Both (A) and (B) (D) $a^1 b^1 + b^1 c^1 + bc + ab$

36. Consider the propositions:
S_1: If Ramu is in the classroom, then Lokesh will be in the playground
S_2: Ramu is in the classroom and S_3 : Lokesh is in the playground
Then which of the following is TRUE?
(A) S_2 logically follows from S_1 and S_3 but S_3 does not follow logically from S_1 and S_2
(B) S_2 does not follow logically from S_1 and S_3 but S_3 logically follows from S_1 and S_2
(C) S_2 does not follow logically from S_1 and S_3, and S_3 does not follow logically from S_1 and S_2
(D) S_2 logically follows from S_1 and S_3, and S_3 logically follows from S_1 and S_2

37. If $S_1 = \{0, 1, 2, 3, 4\}$, $S_2 = \{1, 2, 3, 4, 5\}$, $S_3 = \{0, 1, 2, 3, 4, 5\}$ and $S_4 = \{1, 2, 3, 4, 5, 6\}$ and $+_m$ and x_m denote the operations of addition modulo m and multiplication

modulo m respectively, then which of the following is NOT an abelian group?

(A) $(S_1, +_5)$ (B) (S_2, x_6)
(C) $(S_3, +_6)$ (D) (S_4, x_7)

38. A stationary value of a function $f(x)$ is a value of x, where $f^1(x) = 0$. The number of distinct stationary values of $f(x) = 8x^5 - 15x^4 + 10x^2$, where $f(x)$ has neither maximum nor minimum is ____

39. In a hostel, there are 5 triple rooms (each room can accommodate 3 students), 6 double rooms (each room can accommodate 2 students) and 3 single rooms (each room can accommodate 1 student). The number of ways in which 30 students can be accommodated in these 14 rooms is ____

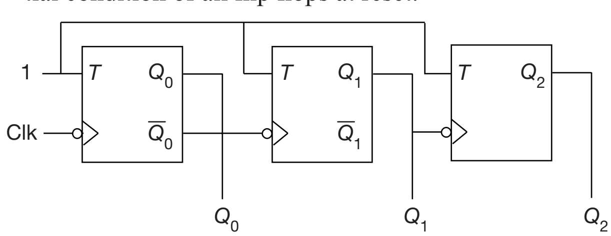
(A) $\dfrac{30!}{(3!)^5 \times (2!)^6 \times (1!)^3}$ (B) $\dfrac{30!}{(5!)^3 \times (2!)^6 \times (3!)^1}$

(C) $\dfrac{30!}{3! \times 2! \times 1!}$ (D) $\dfrac{30!}{5! \times 6! \times 3!}$

40. Which of the following statements is/are NOT TRUE?
(I) The product of two symmetric matrices A and B is symmetric if and only if $AB - BA = 0$
(II) The product of two skew-symmetric matrices A and B is skew-symmetric if and only if $AB + BA = 0$
(III) The eigenvectors corresponding to two distinct eigenvalues of a matrix are linearly independent
(IV) The eigenvectors corresponding to two distinct eigenvalues of a real symmetric matrix are orthogonal

(A) Only (I) (B) Only (II)
(C) Both (III) and (IV) (D) None of these

41. Analyze the following counter circuit, and find the Count sequence $Q_2Q_1Q_0$ (in decimal). Consider the initial condition of all flip flops at reset.



(A) 0, 7, 6, 5, 4, 3, 2, 1, 0….
(B) 0, 1, 2, 3, 4, 5, 6, 7, 0…..
(C) 0, 3, 2, 5, 4, 7, 6, 1, 0….
(D) 0, 6, 2, 5, 1, 7, 3, 4, 0….

42. Which of the following grammar is $LL(1)$, $LR(0)$ and SLR(1)?

(A) $S \to A\,B \mid B\,A$
$A \to b\,A^I$
$B \to a\,B^I$
$B^I \to a\,A\,B^I \mid \in$

(B) $E \to TE^I$
$E^I \to +\,TE^I \mid E$
$T \to E\,F \mid E\,a \mid b$
$F \to (E) \mid a$

(C) $E \to E\,F \mid e$
$F \to F + \mid f$
$T \to E\,T \mid g$

(D) $S \to a\,A\,B\,/\,B\,a \mid A\,b$
$A \to c$
$B \to c$

43. Consider the grammar:
$S \to i\,C\,t\,S\,S^1 \mid a$
$S^1 \to \text{e}\,S \mid \in$
$C \to b$
An $LL(1)$ Parsing table, M is constructed for this grammar and the grammar is not in $LL(1)$. Then which of the following entries in M, contains multiple entries?

(A) $M[S^1, t]$ (B) $M[S, i]$
(C) $M[S^1, e]$ (D) $M[S, a]$

44. Consider the following Syntax Directed Definition:

Production	Semantic Rule
(1) $L \to E_n$	L.val = E.val
(2) $E \to E_1 + T$	E.val = E_1. val + T.val
(3) $E \to T$	E.val = T.val
(4) $T \to T_1 * F$	T.val = T_1.val *F.val
(5) $T \to F$	T.val = F.val
(6) $F \to (E)$	F.val = E.val
(7) $F \to$ digit	F.val = digit.lexval

It evaluates the expressions, which are terminated by an end marker 'n' with operators + and *.
Then which of the following statement(s) is/are FALSE?
I. Given SDD is S-attributed grammar.
II. Given SDD is not L-attributed grammar.
III. Given SDD is an attribute grammar.

(A) I, III only (B) II only
(C) I,II only (D) III only

45. Consider a system which is using Round-Robin Scheduling Technique with context switch overhead of 2 ms, what is the value of time quantum(q) for $n = 6$ processes, so that each process must be guaranteed to get its chance (or) turn at the CPU exactly after 36 ms of time (in ms) is __________.

46. Consider the page reference string:
1, 2, 3, 4, 2, 1, 5, 6, 2, 1, 2, 3, 7, 6, 3, 2, 1, 2, 3, 5
If the number of page faults are 9 using LRU page replacement policy then the number of page frames required would be?

(A) 3 (B) 4
(C) 5 (D) 6

47. Consider a system with processes P_1, P_2. X is a Binary semaphore variable with an initial value of 1 and count is a variable with initial value of 1.
The processes P_1, P_2 executes routines $P1()$, $P2()$ for accessing critical section.

P1 ( )	P2 ( )
{	{
DOWN (X)	UP (X);
count + +;	count - -;
UP (X);	DOWN (X);
}	}

Consider the following statements ($S1$, $S2$, $S3$)
$S1$: The maximum value of count can be infinite.
$S2$: The system cannot guarantee progress.
$S3$: The system doesnot provide Mutual Exclusion.
Which of the above statements is/are TRUE?
(A) $S1$only (B) $S1$ and $S3$
(C) $S2$ and $S3$ (D) $S1$, $S2$, $S3$

48. Consider the function fun() which deletes the duplicate elements on a non-empty sorted single linked list.

```
typedef struct SL
{
    int data;
    struct  SL * next;
}SLL;
void fun(SLL *first)
{
    SLL *curr = first, *temp;
    if (!curr)
    return ;
    while (___I___)
    {
        temp = curr → next;
        if (curr → data = = temp →
    data)
        curr → next = temp → next;
        free(temp);
            (____II____)
}}
```

If first node address is passed to fun( ), Fill in the blanks.

	I	II
(A)	curr	temp = temp → next
(B)	curr	curr = curr → next
(C)	! temp	curr = curr → next
(D)	temp	temp = temp → next

49. Consider the following Tree traversals of a binary Tree:
Pre-order: A B C D E F G H J K L M P Q N
In order: C D E B G H F K L P Q M N J A
Construct a binary tree T from above traversals. The number of nodes with one child in the tree are ________

50. Consider the following program:

```
int fun (int * x)
{
    *x+ = 5;
    return (3 * (* x) - 1) ;
}
void main( )
{
int a = 8, b = 12, s1, s2;
s1 = (a/2) + fun(&a);
s2 = fun(&b) * (b/2);
}
```

Which of the following statement(s) is/are TRUE?
(A) The value of $s1$ will be same, irrespective of evaluation order.
(B) The value of $s2$ is will be irrespective of evaluation order.
(C) Both (A) and (B)
(D) None of the above

51. The first 32-bits of an IPv4 header in Hexa-decimal notation has a value 4500139CH. Then which of the following cannot be concluded by these 32-bits?
I. The header length is 20 Bytes.
II. The total length of the packet (both header and data) is 5000 Bytes.
III. The datagram is Last Fragment.
IV. The fragmentation offset field is 628.
(A) III, IV (B) II, III, IV
(C) II only (D) I, II, III, IV

52. The stations on a wireless ALOHA network are maximum of 1200 km apart. Signals propagate with a speed of 3×10^8 m/s. The maximum number of retransmission attempts are 15 and for the attempt number 2, by using Binary exponential Back-off algorithm, which of the following are possible Back-off time values?
(A) 0 ms, 1 ms
(B) 0 ms, 1 ms, 2 ms, 3 ms
(C) 0 ms, 4 ms, 8 ms, 12 ms
(D) 4 ms, 8 ms

53. Consider the below transition table of a PDA M_1:

	ε	0	1
$\to q_0$	$(q_1, \varepsilon, \$)$	–	–
q_1	$(q_2, 1, \varepsilon)$	$(q_1, \$, 0\$)$ M_1 M_2	$(q_1, \$, 1\$)$ M_3 M_4
q_2	–	–	–

Here q_0 is the start state and q_2 is the final state. The transition entries has the form (Q, A, B) where Q is the Target state, A is the top of the stack and B is the symbols to be written in place of top of stack.
$L(M_1)$ accepts the strings of the form,
{w/w contains more 1s than 0s}

Based on this information identify the correct transitions for M_1, M_2, M_3, M_4:

(A) $M1$: $(q_1, 1, \varepsilon)$, $M2$: Not required
$M3$: $(q_1, 0, \varepsilon)$, $M4$: Not required

(B) $M1$: $(q_1, 1, \varepsilon)$, $M2$: $(q_1, 0, 00)$
$M3$: $(q_1, 0, \varepsilon)$, $M4$: $(q_1, 1, 11)$

(C) $M1$: $(q_1, 1, 10)$, $M2$: $(q_1, 0, \varepsilon)$
$M3$: $(q_1, 0, 01)$, $M4$: $(q_1, 1, \varepsilon)$

(D) $M1$: $(q_1, 0, \varepsilon)$, $M2$: $(q_1, 1, \varepsilon)$
$M3$: $(q_1, 1, \varepsilon)$, $M4$: $(q_1, 0, \varepsilon)$

54. Consider the following languages:
$L_1 = \{x^m\, y^n\, z^p \mid (m = n \vee n = p) \wedge m + n + p \geq 10\}$
$L_2 = \{x^m\, y^n\, z^p \mid (m = n \vee n = p) \wedge m + n + p \leq 10\}$
Which of these languages is/are Regular?

(A) L_1 only (B) L_2 only
(C) Both L_1 and L_2 (D) Neither L_1 nor L_2

55. Consider the following languages:
$L_1 = \{a^i\, b^{2i} \mid i \in \{1, 2, \ldots\}\}$
$L_2 = \{a^i b^{i^2} \mid i \in \{1, 2, \ldots\}\}$
Which of the following statement is correct about L_1 and L_2?

(A) Both L_1 and L_2 are CFLs.
(B) L_1 is CFL and L_2 is recursive but not CFL.
(C) Complement of L_2 is CFL.
(D) L_1 is regular and L_2 is CFL.

56. Consider a branch instruction which has below format:

6 bits	5 bits	5 bits	
opcode	R_S	R_T	#immediate

The instruction has 6-bit branch type of opcode, 5-bit registers R_S, R_T and 16-bit immediate value.
A Branch instruction performs a modification of (PC + 4) (address of next instruction) if the condition is true. If the maximum range of jump instruction is $PC + 4 - X$ to $(PC + 4) + Y$. [$(PC + 4) - X$ and $(PC + 4) + Y$ are memory address locations]. Then the respective values of X and Y would be:

(A) –32768 and 32767 (B) 32768 and 32767
(C) 131072 and 131068 (D) 131068 and 131072

57. Consider the following code fragment:

Loop:	LOAD R_1, $0(R_2)$	$R_1 \leftarrow M[0 + R_2]$
	ADD R_1, R_1, #1	$R_1 \leftarrow R_1 + 1$.
	STORE R_1, $0(R_2)$	$M[0 + R_2] \leftarrow R_1$
	ADD R_2, R_2, #4	$R_2 \leftarrow R_2 + 4$.
	SUB R_4, R_3, R_2	$R_4 \leftarrow R_3 - R_2$.

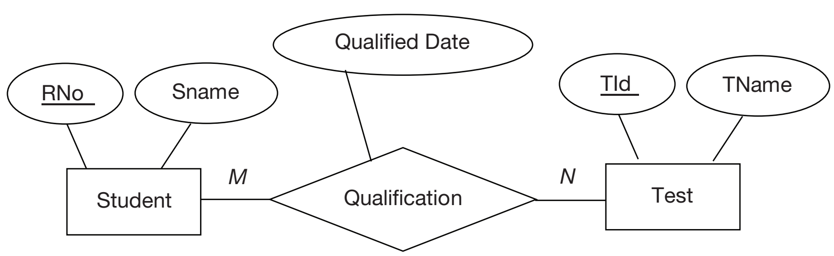
BNEZ R_4, loop Branch to loop if $R_1! = 0$
Let the initial value of R_3 is $R_2 + 400$.
The instruction sequence executed on a 5-stage RISC pipeline. (IF: Instruction Fetch, ID: Instruction decode and Register fetch, E.x., execute, MA: Memory Access, WB: Write Back) without any forwarding hardware, but register read and write can happen in the same clock cycle. Branch outcome is known in the EX stage and is handled by flushing the instructions which started execution before the EX stage of Branch instruction. If each stage takes 1 clock cycle, then the number of clock cycles required to execute the given loop will be ______.

58. A floating point number of 20-bit length has the following format:

1 bits	7 bits	
Sign	Excess – 64 Exponent	Mantissa

The decimal equivalent of the value $(5403E)_{16}$ is ______.

59. Consider the following Entity Relationship Diagram (ERD):



Which of the following possible relations will not hold if the above ERD is mapped into a relational model?

(A) Student (<u>RNo</u>, Sname)
(B) Qualification (<u>RNo</u>, <u>TID</u>, Qualified Date)
(C) Test (<u>TID</u>, <u>RNo</u>, TName)
(D) Test (<u>TID</u>, TName)

60. Consider the following relations:
Sailor (<u>sid</u>, SName, Rating, Age)
Reserves (<u>sid</u>, <u>bid</u>)
Boats (<u>bid</u>, bname, color)
Primary keys are shown with underline.
Query: Display the 'sids' of sailors who have reserved both black and white color boats.
Which of the following Relational algebra expression for the above query always gives correct result?

(A)
$$\pi_{sid}\left(\left(\left(\sigma^{(Boats)}_{color=\text{'black'}} \cap \sigma^{(Boats)}_{color=\text{'white'}}\right) \text{sailor}\right) \text{Reserves}\right)$$

(B) $\pi_{\text{sid}}\left(\sigma^{(\text{Sailor Reserves Boats})}_{\text{color='black'}} \cap \sigma^{(\text{Sailor Reserves Boats})}_{\text{color='white'}}\right)$

(C) $\pi_{\text{sid}}\left(\left(\left(\sigma^{(\text{Boats})}_{\text{color='black'}}\right) \text{Reserves}\right) \text{Sailor}\right) \cap$
$\pi_{\text{sid}}\left(\left(\left(\sigma^{(\text{Boats})}_{\text{color='white'}}\right) \text{Reserves}\right) \text{Sailor}\right)$

(D) All the above

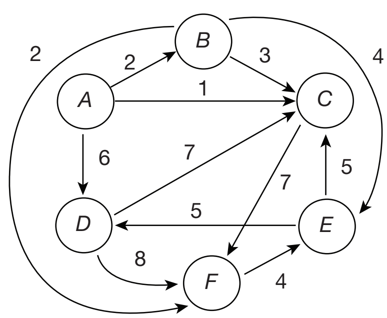
61. Consider the following sequence of elements:

I.	8	7	6	5	4	3	2	1
II.	8	1	2	7	3	6	4	5
III.	8	7	6	5	1	2	3	4

Which sequence(s) takes maximum number of swap operations if selection sort is implemented to arrange the elements in ascending order?

(A) only III
(B) II and III
(C) only II
(D) I and II

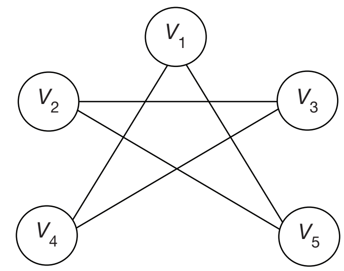
62. Let G be the Directed Weighted graph shown below:



What is the sequence of vertices identified by the Dijkstra's algorithm for single source shortest path, when the algorithm is started at vertex '*A*'?

(A) *ACBEDF*
(B) *ACFBED*
(C) *ACBFED*
(D) *ACBEFD*

63. A complete undirected, Weighted graph *G* is given on the vertex set $\{V_1, V_2, V_3, V_4, V_5\}$



Construct 2 minimum spanning trees, for the First spanning tree, the graph has weights for an edge (V_i, V_j) as $|i-j|$. For the second spanning tree, the graph has weights for an edge (V_i, V_j) as $|i+j|$.
What is the difference between Total weights of 2 Spanning Trees?

(A) 12 (B) 14
(C) 16 (D) 18

64. Consider the following relation schema:
Student (RNo, SName, age, grade)
Register (RNo, CNo, Day)
Course (CNo, CName, Duration)
Which of the following query CANNOT be expressed by using SELECT, FROM, JOIN, DIVIDE, WHERE clauses?

(A) For each course, display the CNo and number of students in that course.
(B) Display the names of students whose CNo = 201
(C) Display the Names and CNo of students who registered on a day = 'Monday'
(D) Display the Names of students whose course duration is 6 months.

65. Consider the Relation *R*(*ABCDE*) and the following functional dependencies:
$A \rightarrow BC$
$A \rightarrow D$
$D \rightarrow E$
Which decomposition is required for *R* and Is the decomposition lossless?

(A) 2NF and loss less (B) 3NF and lossy
(C) 3NF and loss less (D) BCNF and lossy

Answer Keys

1. C	**2.** 5	**3.** B	**4.** A	**5.** D	**6.** A	**7.** B	**8.** A	**9.** A	**10.** B

Hints and Explanations

1. The grammatically correct choice is (C) "fewer". The reason is "fewer" is used when the noun is countable; "Less" is used for uncountable things, as illustrated in "there's less dust on the furniture today; there was less noise in the class, there is less milk in the fridge". "Smaller" and "lesser" are irrelevant. Choice (C)

2. Let the weight of A be a kg and that of B be b kg.
After A and B join, total number of students in the class is 14.
$\therefore$ Before A and B joined, the strength of the class was 12. If we assume that the average weight of the 12 students is n, then after A joins, it is $\frac{12n + a}{13}$

$$\frac{12n + a}{13} = n + 1,$$

$\Rightarrow$ $12n + a = 13n + 13$ —— (1)
$\Rightarrow$ $a = n + 13$
After B joined, the average increases by 1/2.

$$\therefore \quad \frac{12n + a + b}{14} = n + 1 + \frac{1}{2},$$

$\Rightarrow$ $12n + a + b = 14n + 14 + 7$ —— (2)
(2) – (1) gives $b = n + 8$ and $a = n + 13$
$\therefore$ $a - b = 5$. Ans: 5

3. Since 90% of 4000 = 3600 and both 3600 and 4000 are adjacent to each other the sale price of the article should be = ₹3600. Choice (B)

4. Sentences (B) to (D) are all wrong for several reasons. The grammatically correct sentence is (A). The verb "adapt" is rightly used and therefore it is syntactically correct. In sentence (B) the correct word is "adopt" not "adapt". Childless women or couples adopt others' child or children. In sentence (C) the appropriate word is "emigrated", not "immigrated". In sentence (D) the wrong word is "emigrated". The correct word is "immigrated". Choice (A)

5. The Number of letters in the word REPTILE is 7 and $7^2 = 49$. Similarly the number of letters in the word CROCODILE is 9 and $9^2 = 81$.
The number of letters in the word ALLIGATOR is 9 and $9^2 = 81$.
$\therefore$ 81 is the code for the word ALLIGATOR.
Choice (D)

6. The correct sentence with respect to grammar and usage is sentence (A). In sentences (B), (C) and (D) the article "*a*" is omitted before 'few' and that is what makes them wrong and unacceptable. Choice (A)

7. $S = 1 + 3x + 5x^2 + 7x^3 + 9x^4 + \ldots$ $\rightarrow$ (1)
$Sx = x + 3x^2 + 5x^3 + 7x^4 + \ldots$ $\rightarrow$ (2)
----
(1) – (2) $S \Rightarrow (1 - x) = 1 + 2x + 2x^2 + 2x^3 \ldots \infty$
$= 1 + 2x\,(1 + x + x^2 + \ldots \infty)$

$$= 1 + \frac{2x}{1 - x}$$

$$S(1 - x) = \frac{1 + x}{1 - x}$$

$$S = \frac{1 + x}{(1 - x)^2} = 3$$

$3x^2 - 7x + 2 = 0$
$(3x - 1)\,(x - 2) = 0$

$$\Rightarrow \quad x = \frac{1}{3} \text{ (or) } x = 2$$

But $|x| < 1 \Rightarrow x = \frac{1}{3}$ Choice (B)

8. Sentences (1) and (6) remain constant and unchanged while the following and preceding four sentences will be shuffled and rearranged in their proper and logical sequence. Sentence (1) says the passage illustrates how an approach was adopted by an automaker to arrive at a new design for an automobile. The new design entailed constructing new plants (5). In the second sentence (3) the management invited the employees' ideas. In the third sentence (4) the employees were forthcoming with their ideas. In the fourth sentence (2) the author agrees that the workers know better if the wrench works well or not. The logical sequence of the sentences is (A) 5, 3, 4, 2. Choice (A)

9. According to the given information the possible arrangement is as follows.
6 bus 25 6 bus 45 15
$\therefore$ The total number of buses in the parking lot is 29.
Choice (A)

10. The above short passage is exclusively about the varied and unforeseen benefits of reading. Though the benefits can be denied or disputed by some, they are nonetheless real and verifiable. The passage says reading provided healing power by accident to some people. Not only that, reading affords consolation and support to those who are sincerely devoted to reading. Belittling it is of no consequence. The answer choices are (i) and (iv), that is (B). Choice (B)

11. Given matrix is $A = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 2 & 1 \\ 2 & 0 & 3 \end{bmatrix}$

The characteristic equation of A is $|A - \lambda I| = 0$

$$\text{i.e., } \begin{bmatrix} 1-\lambda & 0 & 0 \\ 0 & 2-\lambda & 1 \\ 2 & 0 & 3-\lambda \end{bmatrix} = 0$$

$\Rightarrow$ $(1 - \lambda)\,(2 - \lambda)\,(3 - \lambda) = 0$

$\Rightarrow$ $\lambda = 1, 2, 3$

$\therefore$ The eigenvalues of A are 1, 2 and 3

If X is an eigenvector of A, corresponding to an eigenvalue λ, then $AX = \lambda X \rightarrow (1)$ for exactly one of $\lambda = 1, 2$ and 3.

Among the vectors given in the options, the vector $X = \begin{bmatrix} 2 \\ 2 \\ -2 \end{bmatrix}$ given in option (B) will satisfy the condition $AX = \lambda X$ for $\lambda = 1$

The vector $\begin{bmatrix} 2 \\ 2 \\ -2 \end{bmatrix}$ is an eigenvector of A

Choice (B)

12. We know that among all bipartite graphs with n vertices, the maximum number of edges occur in a complete bipartite graph.
Also, among all the complete bipartite graphs with n vertices, the complete bipartite graph $K_{\left(\frac{n-1}{2}\right),\left(\frac{n+1}{2}\right)}$ will have the maximum number of edges if n is odd.
Here $n = 11$

$\therefore$ The complete bipartite graph $K_{\left(\frac{11-1}{2}\right),\left(\frac{11+1}{2}\right)} = K_{5,6}$ will have the maximum number of edges with 11 vertices.

And the number of edges in $K_{5,6} = 5 \times 6 = 30$
Hence the number of edges in a bipartite graph
With 11 vertices = 30 Choice (C)

13. Standard Results Choice (D)

14. Average number of telephone calls coming to a telephone exchange $= \lambda = 3$ calls per hour

$\therefore$ Probability that the number of telephone calls coming to a telephone exchange exceeds 3

$= P(x > 3) = 1 - P(x \leq 3)$

$= 1 - [P(x = 0) + P(x = 1) + P(x = 2) + P(x = 3)]$

$$= 1 - \left[\frac{\lambda^0 e^{-\lambda}}{0!} + \frac{\lambda^1 e^{-\lambda}}{1!} + \frac{\lambda^2 e^{-\lambda}}{2!} + \frac{\lambda^3 e^{-\lambda}}{3!}\right]$$

$$= 1 - \left[e^{-3} + 3e^{-3} + \frac{9}{2}e^{-3} + \frac{9}{2}e^{-3}\right]$$

$= 1 - (13e^{-3}) = 0.3528$ Choice (A)

15. Given $f(x) = 2x$, $g(x) = 3x^2$ and $h(x) = 3$

$\therefore$ (fogoh) (3) $= f(g(h(3)) = f(g(3)) = f(27) = 54$

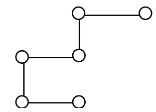
Ans : 54

16. The given numbers are 1, 2, 3, ..., 99.
Each key contains maximum 2-digits
Radix-sort is implemented 2-times (2-Iterations)
In each Iteration, we perform n-Enqueue operations and n-Dequeue operations, Total $(2n)$ operations.

2nd-Iteration also takes $(2n)$ operations
Let us assume, $k = 2$ (The number of digits in each key)

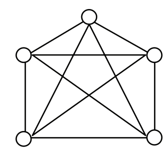
$\therefore$ Time complexity $O(k * n) = O(n)$
(k is very small) Choice (D)

17. I. Let us consider the following graph which is not a cyclic graph



Vertices (n) = 6
Edges (E) = 5
$E = n - 1$

II. Consider the following simple graph



Vertices (n) = 5
Edges (E) = 10
$E = \frac{(n-1)n}{2}$

Both statements are TRUE. Choice (C)

18. Latency or Rotational delay $= \frac{1}{2r}$

r = rotations per second
1 minute – 600 rotations

60 seconds – 600 rotations 1 second – r

$$r = \frac{600}{60} = 10\ \frac{1}{2r} = \frac{1}{2 \times 10} = \frac{1}{20} = 0.05 \text{ seconds}$$

Choice (C)

19. - B-tree construction on 10 elements, either ascending or descending order gives maximum number of Node splits.
- B+-tree, only on descending order of elements gives worst-case, that is maximum number of node splits. Choice (C)

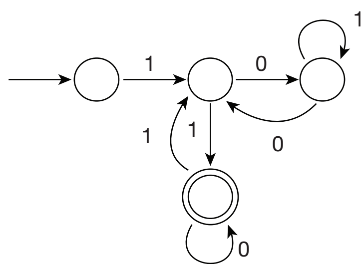
20. Statement I is FALSE. The lower frequency processor may have higher IPC than higher frequency processor.
II is also FALSE. Because the processor which executes more number of instructions does not imply that the processor always finishes a program faster.
(Θ Different processors requires different number of instructions to execute). Choice (D)

21. The Dependencies will be resolved in the 3rd stage. If the delay slot is 2 clock cycles then the pipeline ensures correct operation.

	1	2	3	4	5	6	7	8	
I_L			S_1	S_2	S_3	S_4	S_5		
I_{L+1}				S_1	S_2				
I_{L+2}					S_1				
I_T						S_1			

If the delay slot is 2 then in the 3rd stage the branch instruction will be evaluated and target instruction will be evaluated in the next cycle. Ans: 2

22. L consists of the binary strings
$\{11, 110, 1001, 1100, 1111, 10010, ...\}$
i.e., L consists of the numbers which are divisible by 3.
The DFA is shown below:



Choice (A)

23. Finding the emptiness of a CFL is decidable. Remaining three problems are undecidable. Choice (C)

24. Shutdown( ) will block the communication in both ways. Close( ) will destroy the socket. Choice (B)

25. A repeater does not connect two LANs. It connects segments of LANs. Choice (B)

26. Caesar Cipher is also referred as shift cipher.
In shift cipher, the encryption algorithm, "shift key characters down" i.e., towards the end of the alphabet. (with key as some number).
For GATECS with key = 10, the encrypted message is QKDOMC. Choice (D)

27. Binding can take place at language design time, language implementation time, compile time, load time and link time.

Choice (D)

28. According to static scoping, the value of 'x' will be 5, as fun1( ) will associate with global variable of 'x'.
Choice (A)

29. Number of binary tree structures with 3 elements is $\frac{{}^{6}C_3}{3+1} = 5$ (With 'n' element it is $\frac{{}^{2n}C_n}{(n+1)}$.)
Number of binary trees that can be formed with n nodes is $\left(\frac{{}^{2n}C_n}{n+1} \times n!\right) = 5 \times 3! = 30$ Ans: 30

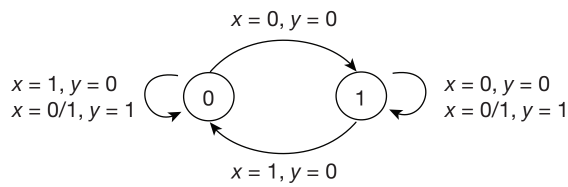
30. Root directory is placed at fixed location on the disk
Choice (B)

31. Efficiency $= \frac{\text{Process execution time}}{\text{Waiting time + Process execution time}}$.
As the switching of the processes and the execution of process takes same amount of time, the efficiency will be 50%. Choice (B)

34. When $y = 1$, the output of or gate is 1, so NAND gate outputs will be $\overline{1 \cdot \bar{Q}} = Q, \overline{1 \cdot Q} = \bar{Q}$ i.e., output Q, $\bar{Q}$ remains in same state as long as $Y = 1$, irrespective of X input.
When $Y = 0$, the circuit works as follows

Y	X	Output OR gate 1	Output OR gate 2	Output (Q) NAND gates	Output NAND gates ($\bar{Q}$)
0	0	0	1	1	0
0	1	1	0	0	1

So when $y = 0$, next state depends on X value.
If $x = 0$, next state = 1
if $x = 1$, next state = 0



Choice (D)

35. $F(a, b, c) = \pi M(2, 5)$
$= \Sigma_m(0, 1, 3, 4, 6, 7)$

a \ bc	00	01	11	10
0	1	1	1	
1	1		1	1

$= a^1c + b^1c^1 + ab$

a \ bc	00	01	11	10
0	1	1	1	
1	1		1	1

$= a^1b^1 + bc + ac^1$
So both (A) and (B) choices are true. Choice (C)

36. Let p : Ramu is in the class
And q : Lokesh is in the playground
$\therefore$ The propositions S_1, S_2 and S_3 can be symbolically represented as
$S_1 : p \to q$; $S_2 : p$ and $S_3 : q$
$\therefore$ $p, p \to q \Rightarrow q$ (By modus ponens)
$\therefore$ S_3 logically follows from S_1 and S_2
Also, when p is false and q is true, $p \to q$ is true i.e., when S_1 and S_3 are true, S_2 is false.
Hence S_2 does not logically follow from S_1 and S_3
Choice (B)

37. Among the options given, consider option (B), (S_2, X_6) where $S_2 = \{1, 2, 3, 4, 5\}$
For $3, 4 \in S_2$, $3\ X_6\ 4 = 0 \notin S_2$
$\therefore$ S_2 does not satisfy closure axiom under 'X_6'
Hence (S_2, X_6) is not an abelian group Choice (B)

38. Given $f(x) = 8x^5 - 15x^4 + 10x^2$

$f'(x) = 40x^4 - 60x^3 + 20x$

$f'(x) = 0 \Rightarrow 40x^4 - 60x^3 + 20x = 0$

$\Rightarrow \quad x(x-1)^2(2x+1) = 0$

$\Rightarrow \quad x = 0; x = 1, 1 \text{ and } x = \dfrac{-1}{2}$

$\therefore$ The stationary values of $f(x)$ are 0, 1 and $\dfrac{-1}{2}$

$f''(x) = 160x^3 - 180x^2 + 20$

At $x = 0$; $f^{II}(x) = 20 > 0$

$\therefore$ $f(x)$ has a minimum at $x = 0$

At $x = \dfrac{-1}{2}$, $f^{II}(x) = -45 < 0$

$\therefore$ $f(x)$ has a maximum at $x = \dfrac{-1}{2}$

At $x = 1$; $f^{II}(x) = 0$

$f'''(x) = 480x^2 - 360x$

At $x = 1$; $f^{III}(x) = 120 \neq 0$

$\therefore$ $f(x)$ has neither maximum nor minimum at $x = 1$

$\therefore$ The number of stationary values where $f(x)$ has neither maximum nor minimum = 1 Ans: 1

39. The number of ways of accommodating 30 students in 14 rooms, of which 5 are triple, 6 are double and 3 are single rooms = The number of ordered partitions of a set with 30 elements into 14 sets with first 5 sets containing 3 elements each, the next 6 sets containing 2 elements each and the last 3 sets containing one element each

$= P(30; 3, 3, 3, 3, 3, 2, 2, 2, 2, 2, 2, 1, 1, 1)$

$= \dfrac{30!}{(3!)^5 \times (2!)^6 \times (1!)^3}$ Choice (A)

40. Standard Results Choice (D)

41. From the given circuit, all flip flops are falling edge triggered flip flops and $T = 1$, so all flip flops will toggle their state when clk pulse occurs. clk input is connected to Q_0, so for every clk pulse Q_0 change its state.

$\bar{Q}_0$ is connected to negative edge triggered flip flop (Q_1)

So Q_1 will change (toggle) when $\bar{Q}_0$ changes from 1 to 0. (i.e., Q_0 changes from 0 to 1)

Q_1 is connected to next stage (Q_2), so whenever Q_1 has change from 1 to 0, then Q_2 will get toggle. we can summarize as below:

Q_0 – toggles for every clk pulse

Q_1 – toggles when Q_0 changes from 0 to 1

Q_2 – toggles when Q_1 changes from 1 to 0

Clk	Q_2	Q_1	Q_0
0	0	0	0
1	0	1	1
2	0	1	0
3	1	0	1
4	1	0	0
5	1	1	1
6	1	1	0
7	0	0	1
8	0	0	0

So sequence is 0, 3, 2, 5, 4, 7, 6, 1, 0….

Choice (C)

42. Option (A): it is LL(1), SLR(1) and LR(0)

Option (B): it is neither LL(1), LR(0) nor SLR(1)

Option (C): it is not LL(1), LR(0) but SLR(1)

Option (D): it is not LL(1), LR(0) but SLR(1)

Choice (A)

43. The parse table for the grammar is:

	a	b	e	i	t	$
S	$S \to a$			$S \to iCtSS^1$		
S^1			$S^1 \to \epsilon$ $S^1 \to eS$			$S^1 \to \epsilon$
C		$C \to b$				

$M[S^1, e]$ contains multiple entries

Choice (C)

44. Given SDD is an attribute grammar as it does not have any side effects.

It is also S-attributed as given SDD only involves synthesized attributes. (val and lexval are synthesized attributes).

It is also L-attributed as the attributes are synthesized.

Choice (B)

45. $q = \dfrac{t - ns}{(n-1)} = \dfrac{36 - 6 \times 2}{5} = \dfrac{24}{5} = 4.8$ Ans: 4.8

46. 1, 2, 3, 4, 2, 1, 5, 6, 2, 1, 2, 3, 7, 6, 3, 2, 1, 2, 3, 5

1
2
~~3~~ 6
~~4~~ 3
~~5~~ ~~7~~ 5

= 9 page faults Choice (C)

47. The maximum value of count is infinite only if $P1$ is in the system and executes $P1(\ )$ infinite times.

The solution guarantees progress among the processes. Both the processes can be in critical section at the same time if P_2 executes 1st instruction in $P2(\ )$ followed by process $P1$ executing $P1(\ \ )$. No mutual-exclusion is guaranteed.

Choice (B)

48. Choice (B)

49. **In-order:**

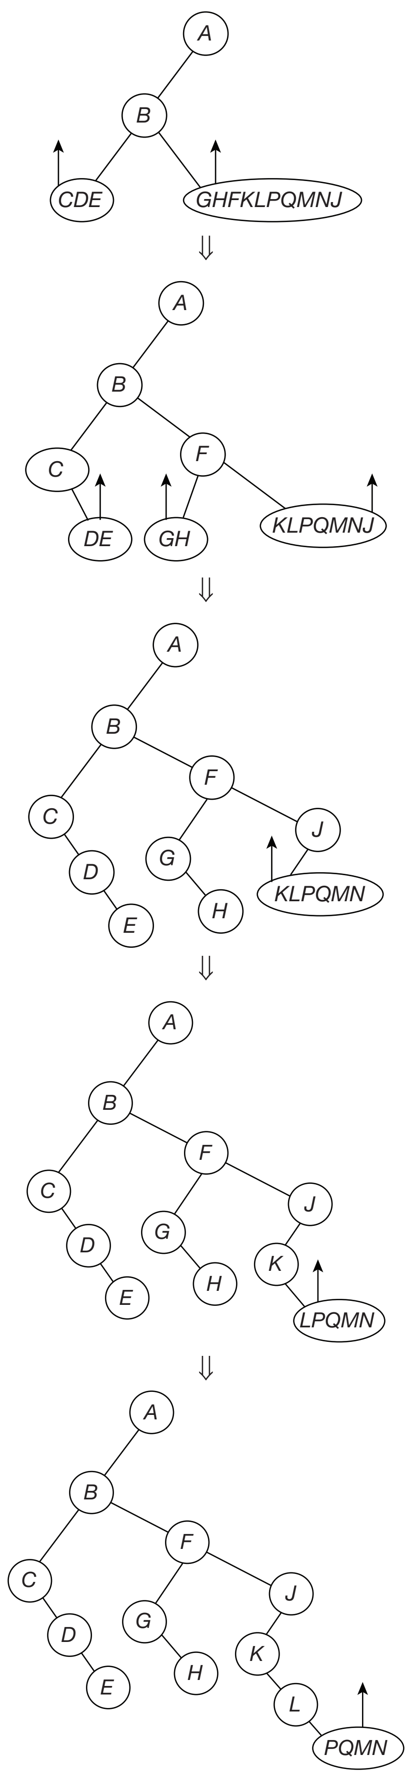
C D E B G H F K L P Q M N J (A)

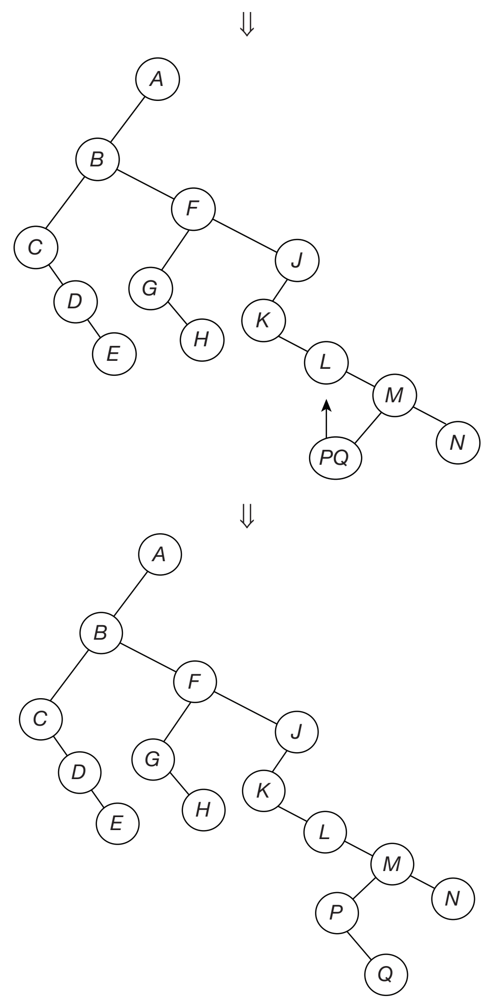
In order for the traversal is

C D E B G H F K L P Q M N J (A)

Pre-order: *A B C D E F G H J K L M P Q N*

C D E B G H F K L P Q M N J





The number of nodes with single child node is 8.

Ans: 8

50. The value of $s1$ and $s2$ will be 42 and 400, if the evaluation order is from left to right.
The value of $s1$ and $s2$ will be 44 and 300, if the evaluation order is from right to left.

Choice (D)

51. Given 32-bit of IPv4 header is
$(4500\ 139C)_{16}$
$= (0100\ 0101\ 0000\ 0000\ 0001\ 0011\ 1001\ 1100)_2$
First 4-bits represents version 4.
Next 4-bits represents header length (in multiple of 4).
$5 \times 4 = 20$ Bytes
Next 8-bits are for service field.
Next 16-bits represents Total length (Header + Data) 5020 bytes.
Fragmentation information is not included in these 32-bits.

Choice (B)

52. Distance between Stations = 1200 km
Signal propagation speed = 3×10^8 m/s

Maximum propagation time $= \dfrac{\text{Distance}}{\text{Speed}}$

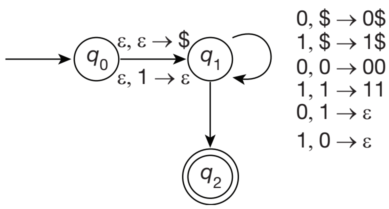
$= \dfrac{1200 \times 10^3}{3 \times 10^8} = 4$ msec

For number of attempts, $k = 2$, the range of values is $\{0, 1, 2, 3\}$.

T_B (Back-off time) = Random number in range of values * propagation time.

$\therefore$ Possible Back-off time values are 0 ms, 4 ms, 8 ms, 12 ms. Choice (C)

53. The PDA which accepts more number of 1's than 0's is shown below:



The PDA pushes a zero or one on to the stack and pops a zero or one with inputs one or zero respectively. It pushes 0's (or 1's) with Top of stack 0's (or 1's).

And finally it reaches final state if there is atleast one 1 remained on the stack. Choice (B)

54. L_1 is not regular. In L_1, sum of number of x, y, z are more than 10 and we have to check the equality of m, n or n, p, which is not possible with *FA*.

L_2 is regular. The sum of number of x, y, z is less than or equal to 10 and we can easily check the equality of m, n or n, p (as the number of combinations is Limited). i.e., we can have one x, one y and number $(z\text{'s}) \le 8$.

Two x's, Two y's and number $(z\text{'s}) \le 6$

Three x's, Three y's and number $(z\text{'s}) \le 4$ etc.

Choice (B)

55. $L_1 = \{a^i\, b^{2i} \mid i \in \{1, 2, ...\}\}$

L_1 is CFL but not regular. PDA can be designed, which pushes 2 a's for each a and pop an 'a' for each b.

$L_2 = \{a^i\, b^{i^2} \mid i \in \{1, 2, ...\}\}$

L_2 is not CFL. (Its complement is also not CFL). But we can design a Halting Turing machine to recognize strings of the form $a^i\, b^{i^2}$. Choice (B)

56. The immediate value has 16-bit length. For branch instructions, the immediate value takes signed 2's complement representation. The range of signed 2's complement numbers is

-2^{n-1} to $2^{n-1} - 1$ (n is number of bits)

Here $n = 16$

$\therefore$ $X = 2^{15} \times 4$

$Y = (2^{15} - 1) \times 4$

($\because$ Each instruction requires 4 locations).

$X = 131072$

$Y = 131068$ Choice (C)

57. Given code,

Loop: I_1: LOAD R_1, $0(R_2)$
I_2: ADD R_1, R_1 #1
I_3: STORE R_1, $0(R_2)$
I_4: ADD R_2, R_2, #4
I_5: SUB R_4, R_3, R_2
I_6: BNEZ R_4, Loop

Initially value of R_3 is R_2 +400. In every iteration R_2 is incremented by 4. Based on R_4 value the loop will get executed.

$R_4 = R_3 - R_2$

Both R_3 and R_2 will have equal value after $100 = \left(\dfrac{400}{4}\right)$ iterations.

The timing diagram for the 1st iteration of the loop is shown below:

	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19
I_1	IF	ID	EX	MA	WB														
I_2		IF	Stall	Stall	ID	EX	MA	WB											
I_3					IF	Stall	Stall	ID	EX	MA	WB								
I_4								IF	ID	EX	MA	WB							
I_5									IF	Stall	Stall	ID	EX	MA	WB				
I_6												IF	Stall	Stall	ID	EX	MA	WB	
I_7																	IF	ID	

From the Timing diagram we can observe that 2 stages of two iterations are overlapped. So for 1^{st} 99 iterations it takes 16 clock cycles and 100^{th} iteration takes 18 clock cycles.

$\therefore$ Number of clock cycles for 100 iterations

$= 99 \times 16 + 18 = 1602$ Ans: 1602

58. Given number is $(5403E)_{16}$

= 0101 0100 0000 0011 1110

Sign = 0 = positive

excess – 64 exponent

= 101 0100 = 84

Exponent = 84 – 64 = 20

Mantissa = 0.0000 0011 1110 = $(0.015)_{10}$

$\therefore$ Given number = $(0.015)_{10} \times 2^{20} = 15872$

Ans: 15872

59. When we have M:N relation, A separate relation is taken to place all primary keys of participating entities.

Option (C)

Test (TID, RNo, TName)

If we include RNo in Test entity, there is a scope of lot of Redundant values.

Choice (C)

60. Lets Assume some tuples for all three tables:

Sailor

Sid	S. Name	Rating	age
11	Anu	7	30
12	Radha	8	20
13	Sita	6	40
14	Karan	7	20
15	Sita	7	30

Reserves

Sid	bid
11	201
11	203
12	201
13	203
14	202
15	201

Boats

bid	bname	color
201	A	black
202	B	blue
203	C	white
204	C	red

Option (A):

$\sigma^{(Boats)}_{color=\text{'black'}} \cap \sigma^{(Boats)}_{color=\text{'white'}}$

201	A	black

$\cap$

203	C	white

$= \phi$

Option (B)

Sid	Sname	Rating	age	bid	bname	color
11	Anu	7	30	201	A	black
12	Radha	8	20	201	A	black
15	Sita	7	30	201	A	black

Sid	Sname	Rating	age	bid	bname	color
11	Anu	7	30	203	C	white
13	Sita	6	40	203	C	white

Result = ϕ (ϕ values should be same under all the columns of 2-tables)

Option (C)

π_{sid} from First part of query

Sid

Choice (C)

61. I.

8 7 6 5 4 3 2 1 (1^{st} Swap)

1 7 6 5 4 3 2 8 (2^{nd} Swap)

2 6 5 4 3 7 8 (3^{rd} Swap)

3 5 4 6 7 8 (4^{th} Swap)

4 5 6 7 8

$\therefore$ 4-swap operations.

II.

8 1 2 7 3 6 4 5 (1^{st} Swap)

1 8 2 7 3 6 4 5 (2^{nd} Swap)

2 8 7 3 6 4 5 (3^{rd} Swap)

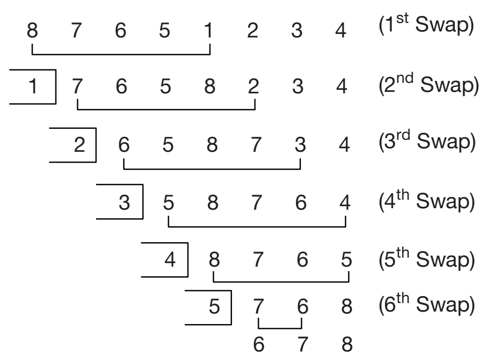
3 7 8 6 4 5 (4^{th} Swap)

4 8 6 7 5 (5^{th} Swap)

5 6 7 8

$\therefore$ 5 swap operations.

III.



∴ 6 swap operations Choice (A)

62. Solution set $S[A]$

I-Iteration:

$S[A]$ source = A
dist $[B] = 2$
dist $[C] = 1$
dist $[D] = 6$
dist $[E] = \infty$
dist $[F] = \infty$

II-Iteration:

S$[AC]$
dist $[B] = \min\{2, \infty\} = 2$
dist $[D] = \min\{6, \infty\} = 6$
dist $[E] = \min\{\infty, \infty] = \infty$
dist $[F] = \min\{\infty, 8\} = 8$

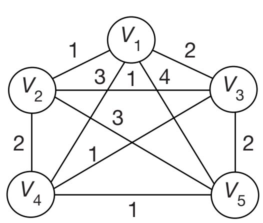
III – Iteration

$S[ACB]$
dist $[D] = \min\{6, \infty\} = 6$
dist $[E] = \min\{\infty, 6\} = 6$
dist $[F] = \min\{8, 4\} = 4$

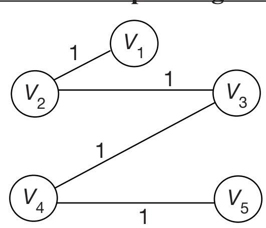
IV-Iteration

$S[ACBF]$
dist $[D] = \min\{6, \infty\} = 6$
dist $[E] = \min\{6, 8\} = 6$
Next we can take either D (or) E Choice (C)

63. Graph 1



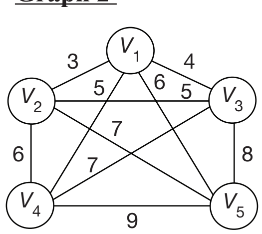
Minimum spanning Tree 1



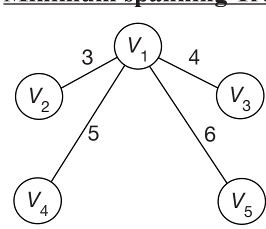
Total weight = 1 + 1 + 1 + 1 = 4

Total weight = 1 + 1 + 1 + 1 = 4

Graph 2



Minimum spanning Tree 2



Total weight = 3 + 4 + 5 + 6 = 18

Total weight = 3 + 4 + 5 + 6 = 18

∴ Difference between both Spanning Trees total weight is 18 – 4 = 14

Choice (B)

64. Option (A)

SELECT CNo, count (*)
FROM Register
WHERE
GROUPBY CNo

Option (B)

SELECT SName
FROM student JOIN Register ON(RNo)
WHERE CNo = 201

Option (D)

SELECT SName
FROM student JOIN Register ON(RNo),
Register JOIN Course ON(CNo)
WHERE Duration = 6 months

Option (C)

SELECT SName, CNo
FROM student JOIN Register ON(RNo)
WHERE Day = 'Monday'

Option (A) Cannot be expressed, because we need GROUPBY clause

Choice (A)

65. $A \rightarrow BC$
$A \rightarrow D$
$D \rightarrow E$

L	M	R
A	D	BC

$A^+ = \{ABCDE\}$
key = A
$A \rightarrow D$ Transitivity exists
$D \rightarrow E$ It violates 3NF
We need to perform 3NF – Decomposition.
The decomposed tables are $R_1(ABCD)$, $R_2(DE)$

Check for lossless decomposition:

	A	B	C	D	E
R_1 (ABCD)	*	*	*	*	*
R_2 (DE)				*	*

∴ It is loss less decomposition.

Choice (C)

Mock Test 2

Number of Questions: 65 **Total Marks: 100**

Wrong answer for MCQ will result in negative marks, (–1/3) for 1 Mark Questions and (–2/3) for 2 Marks Question.

General Aptitude

Number of Questions: 10 **Section Marks: 15**

Directions for question 1: Select the word most similar in meaning to the given word:

1. Risque:
   (A) Risky (B) Lascivious
   (C) Queasy (D) Pompous

***Directions for questions 2 and 3*:** Select the correct alternative from the given choices.

2. In a certain code language, GOOGLE is coded as HNPFMD. How is the word APPLE coded in that language?
   (A) BOGKE (B) BQOKF
   (C) BOQKF (D) None of these

3. The numbers a, b, c, d and e form a geometric progression. Which of the following also form a geometric progression?
   (i) a^2, b^2, c^2, d^2, e^2
   (ii) $a - 1, b + 2, c - 3, d + 4, e - 5$
   (iii) $3a, 3b, 3c, 3d, 3e$
   (A) Only (i) (B) Only (i) and (ii)
   (C) Only (iii) and (i) (D) None of these

***Directions for question 4*:** Select the most suitable one word substitute for the following expression:

4. A place where everything is perfect:
   (A) Heaven (B) Cosmos
   (C) Synagogue (D) Utopia

***Direction for question 5*:** Select the appropriate word/phrase out of the given options to complete the following sentence:

5. Neither the teacher nor the students __________ any clue as to who could have stolen the keys to the office treasury.
   (A) was (B) has
   (C) have (D) were

***Directions for question 6*:** Select the correct alternative from the given choices.

6. Consider a function $f(x) = 3 - |x|$, where $-2 \le x \le 2$. The minimum and maximum values of $f(x)$ are:
   (A) 0, 2 (B) 0, –2
   (C) 1, 3 (D) 0, –4

***Directions for question 7*:** In the following sentence certain parts are underlined and marked P, Q, and R. One of the parts may contain a certain error or may not be acceptable in standard written communication. Select the part containing the error. Choose D as your answer if there is no error.

7. <u>There are no machineries</u> for resolving
   (P)
   <u>these disputes and this has,</u> in no small
   (Q)
   measure, compounded <u>the present situation.</u>
   (R)
   (A) P (B) Q
   (C) R (D) No error

***Directions for question 8*:** Which one of the statements given below the passage is logically valid and can be inferred from the passage below?

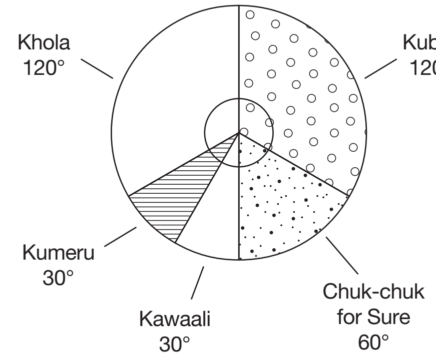
8. Napoleon Bonaparte was one of the world's youngest generals. At the age of 24 he was master of the art of war, a military general and a cruel dictator at heart. He had the magnetism of the great and he won devoted friendship from many. His glance, like Akbar's, was magnetic. He often said that he had won many battles with his eyes, not the sword. A strange statement for a man who had plunged Europe into war. And it appears, during his last years when he was imprisoned at St. Helena, he had a change of heart. Good thoughts came to him during the fading years of life, his painful period of exile. He was much chastened, and perhaps wrote to influence posterity in his favour. He wrote that the conquest of the spirit is greater than the conquest of the sword.
   (A) Napoleon Bonaparte was not the world's youngest general.
   (B) Napoleon Bonaparte was not the world's youngest dictator.
   (C) Napoleon Bonaparte believed that some day victories would be won without cannons and bayonets.
   (D) Napoleon Bonaparte was thoroughly irreligious but he encouraged religion.

***Directions for questions 9 and 10*:** Select the correct alternative from the given choices.

9. The chairman of a multinational corporation desires to appoint four of the five selected persons A, B, C, D and E to lead the four different domains of the organization, which are Operations, Marketing, Finance and R&D. C doesn't want to get hitched to one specific domain as he desires to have an exposure to all the four domains.

B is given the designation of Operations head. Neither *D* nor *A* is posted as Marketing heads.
Which of the following can be a valid assignment of heads to the domains?
(A) *A*–Marketing, *B*–Operations, *C*–Finance, *D*–R&D
(B) *A*–Finance, *B*–Operations, *D*–R&D, *E*–Marketing
(C) *A*–Operations, *B*–Finance, *C*–R&D, *D*–Marketing
(D) None of these

10. The pie chart below gives the breakup of market share by volume of five different fleet management companies in the year 2015. The proportion of male to female customers of each company is 5 : 1. If the total number of customers of the five companies in 2015 is 216000. The Number of customers of Chuk-chuk for Sure are females is _____.



Computer Science Engineering

Number of Questions: 55 **Section Marks: 85**

Directions for questions 11 to 65: Select the correct alternative from the given choices.

11. The third term in the Taylor's series expansion of the function $f(x) = 5x^2 + \cos x$ about $x = \pi$ is ______.

(A) 0 (B) $\frac{9}{2}(x-\pi)^2$
(C) $\frac{11}{2}(x-\pi)^2$ (D) $\frac{13}{6}(x-\pi)^3$

12. If *A* and *B* are two square matrices of same order such that $AB = A$, $BA = B$, then:
(A) both *A* and *B* are idempotent
(B) both *A* and *B* are involutory
(C) *A* is idempotent and *B* is involutory
(D) *A* is involutory and *B* is idempotent

13. If *X* is a continuous random variable with probability density function $f(x)$ given by:

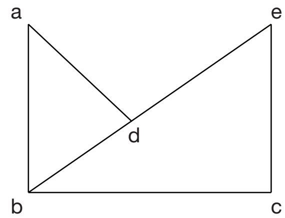
$$f(x) = \begin{cases} ax(1-x); & 0 \le x \le 1 \\ 0; & \text{otherwise} \end{cases}$$

Then the mean of *X* is ______.

14. The maximum possible number of reflexive relations that can be defined on a set $S = \{k, l, m, n\}$ is _________.

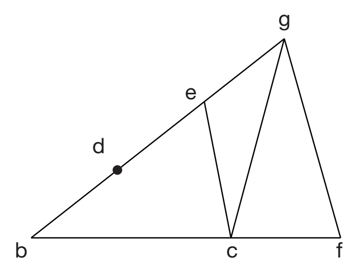
15. Consider an undirected graph G given below.
Which of the following is NOT an induced subgraph of the graph G?

(A)



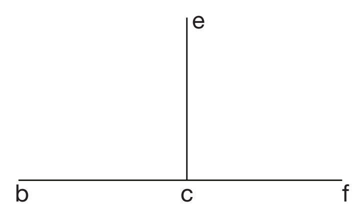
G_1

(B)



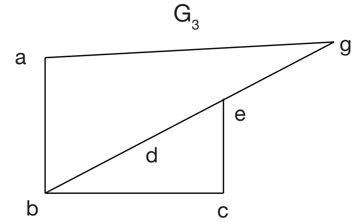
G_2

(C)



G_3

(D)



G_4

16. The minimum number of comparisons required to find the maximum element in a min-heap of *n* elements is:

(A) $\log_2 n$ (B) $\frac{n}{2}$
(C) $\left\lfloor \frac{n}{2} \right\rfloor - 1$ (D) $\left\lceil \frac{n}{2} \right\rceil - 1$

17. Five nodes labeled *P*, *Q*, *R*, *S*, *T* are used to construct a binary tree. The number of distinct binary trees that can be formed such that each of those in-order traversal gives *P Q R S T* is ________.

18. Which of the following mechanisms will interrupt the execution of a process?

(P) Interrupt (Q) Trap
(R) Supervisor call (S) Memory fault
(A) P, R (B) P, Q, R
(C) P, R, S (D) P, Q, R, S

19. Which of the following is affected from external fragmentation?

(A) Simple paging
(B) Virtual memory segmentation
(C) Virtual memory paging
(D) None of the above

20. Consider the following:

$E \rightarrow TE^I$
$E^I \rightarrow +TE^I | \in$
$T \rightarrow FT^I$
$T^I \rightarrow *FT^I | \in$
$F \rightarrow (E) |$ id

The follow set of F does not contain

(A) {id, (} (B) {+, $}
(C) {$, *} (D) {*,)}

21. Which of the following statement is TRUE?

(A) Preprocessing is required for every programming language before compiling a program.
(B) Symbolic names can be associated with the mnemonic instruction.
(C) Symbol table can be implemented using hash table.
(D) All of the above

22. Consider an AVL Tree with 'n' elements stored in an array [with array index starting from 1]. Now a Binary search is performed on some elements in AVL tree that is on the elements positioned on (2^i-1) places. Time complexity for searching an element on the above scenario will be:

(A) $O(\log(\log n))$
(B) $O(\log n)$
(C) $O(n)$
(D) Binary search cannot be implemented for above scenario.

23. Consider a Recurrence equation,

$T(n) = 3T(n-1) + O(n^2)$

Then the time complexity for $T(n)$ is:

(A) $O(n^2)$ B) $O(n^3)$
(C) $O(3^n \cdot n^3)$ (D) $O(3^n \cdot n^2)$

24. Consider a relation $R(X, Y, Z, P, Q)$ with functional dependencies:

$XYZ \rightarrow PQ$
$Q \rightarrow YZP$

The number of candidate key(s) for the relation R is ______.

25. Consider a relation,

Student (Roll-No, Name, mark1, mark2)

Which of the following query is valid on this relation?

(A) select SUM(Name) from Student
(B) select Average(mark1, mark2) from Student
(C) select Roll-No, Max (marks) from Student
(D) select SUM(mark1) from Student

26. Match the following:

Group–A		Group–B	
A	Binary search	1.	Divide and conquer
B	Traveling sales person problem	2.	Greedy approach
C	Merge sort	3.	Dynamic programming
D	Job sequencing problem	4.	Back tracking

(A) A–1, B–3, C–1, D–2
(B) A–4, B–2, C–4, D–4
(C) A–4, B–3, C–1, D–4
(D) A–1, B–2, C–1, D–2

27. Which of the following task is not related to Instruction cycle?

(i) Instruction fetch
(ii) Zero or more operand fetch
(iii) Zero or more operand stores
(iv) An interrupt check if interrupts are enabled

(A) (ii), (iii)
(B) (ii), (iv)
(C) (iv) only
(D) All the tasks are related to instruction cycle

28. A program which has 10000 instructions, run on a 20 MHz processor, with the following instruction mix and clock cycle count.

Instruction type	Instruction count	Clock cycles
I_1	4500	1
I_2	3200	2
I_3	1500	2
I_4	800	2

What will be the values of CPI and MIPS respectively?

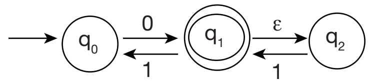
(A) 2 and 0.0775 (B) 1.55 and 12.9
(C) 1.75 and 12.9 (D) 1.55 and 0.0775

29. Which of the following operations is/are not internal processor operations of instruction cycle?

(i) Instruction fetch
(ii) Instruction address calculation
(iii) Instruction operation Decoding
(iv) Operand fetch
(v) Data operation
(vi) Operand address calculation
(vii) Operand store

(A) (i), (ii), (iii)
(B) (iv), (v), (vi), (vii)
(C) (i), (iv), (vii)
(D) (ii), (vi)

30. Consider the following ε-NFA:



If the ε-Transition needs to be removed, then how many new transitions will be added and what are they?

(A) 2, $q_1 \xrightarrow{1} q_2, q_1 \xrightarrow{1} q_1$
(B) 1, $q_1 \xrightarrow{1} q_2$
(C) 2, $q_1 \xrightarrow{1} q_1, q_0 \xrightarrow{0} q_2$
(D) 1, $q_0 \xrightarrow{0} q_2$

31. Which of the following statement is FALSE?

(A) Amongst the three languages Regular, context-free and recursive, Regular language is most specific.
(B) If P is recursively enumerable but not recursive then $\overline{P}$ is non-recursively enumerable.
(C) If C is a context free language then $\overline{C}$ is recursive.
(D) If R is a regular expression and T is a turning machine for the language then T may or may not halt on R.

32. Which of the following is FALSE about OSI layered model?

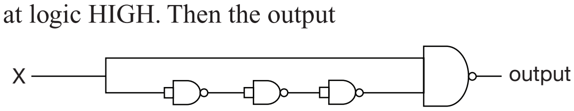
(i) Physical, Data link, Network and Transport layers are Host layers.
(ii) The layered architecture provides the modularity.
(iii) Transport layer is responsible for the communication between two applications running on different computers.

(A) (i), (ii) Only (B) (iii) only
(C) (i) only (D) (i), (iii) only

33. Consider below sequence of bits, arrived on a link:
0111 1110 1000 0111 1101 1001 1010 1000 0111 1101 1100 1111 1111 0111 1110.
If HDLC framing is used for the protocol then which of the following is not justified with the given frame format?

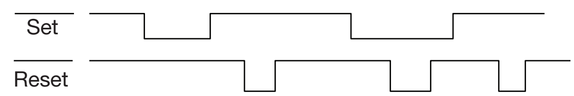
(A) The frame start and end bits are 0111 1110
(B) There are two stuffed bits in the frame
(C) There are 2 error bits in given frame
(D) The address field has 1000 0111

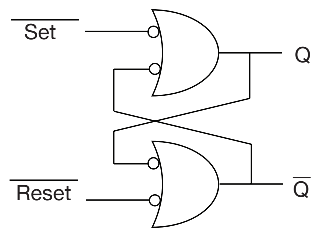
34. Consider the logic circuit with input signal X as shown in the figure. All the gates in the figure shown have identical non-zero delay. The signal X which was at logic LOW is switched to logic HIGH and maintained at logic HIGH. Then the output



(A) Stays high throughout
(B) Stays low throughout
(C) pulses from LOW to HIGH to LOW
(D) pulses from HIGH to LOW to HIGH

35. The wave forms $\overline{\text{Set}}$, $\overline{\text{Reset}}$ are applied to the inputs of the following latch, then the wave form of Q will look like? (Consider initial state as 0)





(A) 
(B) 
(C) 
(D) 
36. If 1, 4 and 5 are the eigen values of 3 × 3 matrix A, then the matrix $A^2 - 5A + 6I_3$ has ________.

(A) three distinct eigenvalues
(B) two distinct eigenvalues
(C) all the three eigenvalues are equal
(D) an eigenvalue zero.

37. If p, q and r are any three statement variables, then which of the following is NOT a tautology?

(A) $(p \wedge q) \rightarrow [(p \vee q) \vee (\neg p \wedge \neg q)]$
(B) $[p \wedge (q \vee r)] \vee [\neg p \vee (\neg q \wedge \neg r)]$
(C) $[(p \vee q) \rightarrow r] \leftrightarrow [\neg r \rightarrow \wedge (p \vee q)]$
(D) $[p \rightarrow (q \rightarrow r)] \wedge [\neg p \vee q \vee r]$

38. If a fair die is rolled thrice, then the expected value of the product of the numbers that appear on the die in the three rolls is ________.

(A) $\frac{7}{2}$ (B) $\frac{21}{2}$
(C) $\frac{343}{8}$ (D) $\frac{1}{2}$

39. The maximum value of the function $f(x) = (x - 1)^2 e^{-x}$ is _____.

40. Consider the 2 × 2 matrices $A = \begin{bmatrix} -1 & 0 \\ 0 & -1 \end{bmatrix}$, $B = \begin{bmatrix} 0 & -1 \\ 1 & 0 \end{bmatrix}$, $C = \begin{bmatrix} 0 & 1 \\ -1 & 0 \end{bmatrix}$ and $I = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$ and let $G = \{A, B, C, I\}$. Then the generators of the cyclic group G under matrix multiplication are _______.

(A) A and B (B) B and C
(C) C and I (D) I and A

41. Consider the below truth table:

X	*Y*	*Z*	*F(X, Y, Z)*
0	0	0	1
0	0	1	D
0	1	0	0
0	1	1	0
1	0	0	D
1	0	1	0
1	1	0	1
1	1	1	1

How many number of 2 input NOR gates are required to implement the function $F(X, Y, Z)$ (D-Stands for don't care condition)?

(A) 3 (B) 4
(C) 5 (D) 6

42. Consider a network topology with two nodes $N1$ and $N2$. $N1$ sends a file of 10 MB to $N2$ using sliding window protocol. The Data is sent using a frame of size 1 KB and the size of acknowledgement is 40 Bytes. The propagation delay is 100 ms. The link has a speed of 10 Mbps. $N1$'s sending window size is five frames and receiving window size is 10000 frames. Then the throughput of $N1$ (in KBPS) is ________.

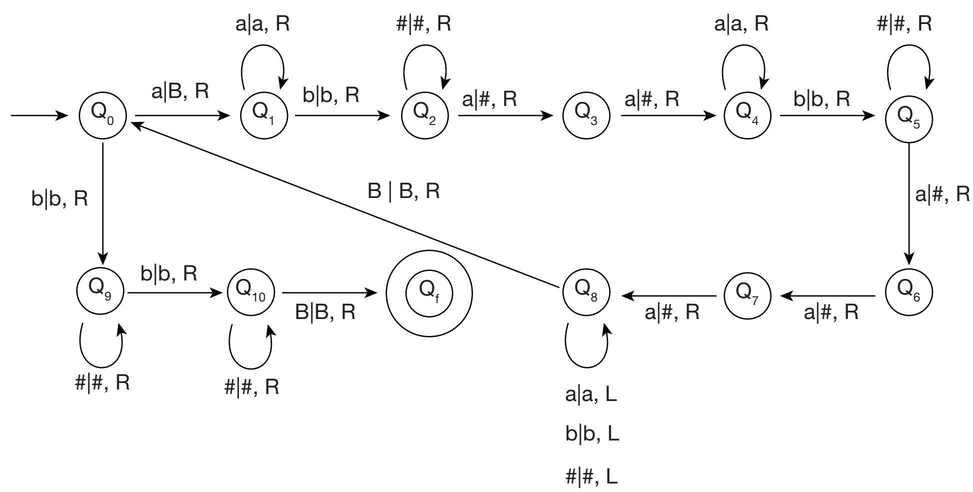
43. Consider a TCP socket connection between application processes $P1$ and $P2$ running on two different hosts. If $P1$ wants to send 10000 Bytes of data to $P2$ and the operating system started sending data from $P1$ to $P2$. Then which of the following is TRUE?

(i) If $P1$ calls close() on the socket before the OS finishes transmitting the data to $P2$ then also the OS continues the transmission of data to $P2$.
(ii) If $P1$ calls close() after the OS has transmitted all the data to $P2$ then OS sends TCP FIN packet to $P1$.
(iii) The process $P2$ can perform multiple receive() calls to receive the entire data from $P1$.
(iv) If $P1$'s connection is closed and $P2$ read all the data from $P1$ then next call of $P2$'s receive() returns an end of stream.

(A) (i), (iii) (B) (ii), (iii)
(C) (ii), (iii), (iv) (D) (i), (ii), (iii), (iv)

44. To transmit the message,
$x^{15} + x^{14} + x^{12} + x^{11} + x^8 + x^6 + x^4 + x^3 + 1$
Using the CRC generator $x^8 + x^6 + x^3 + 1$, the check sequence that will be added to the message to protect it from errors using CRC (in Binary) is _____.

45. Consider below Turing machine:



Each transition $X|Y, D$ specifies the input symbol X, symbol to be written Y and Direction of head movement D. Here $\Sigma = \{a, b\}$ and tape symbols are $\{a, b\ \#, B\}$. What is the language accepted by given Turing machine?

(A) $\{a^n\, b\, a^{n/2}\, b\, a^{n/3} \mid n \geq 0\}$
(B) Set of all strings over Σ such that (number of a's) % 6 = 0
(C) $\{a^n\, b\, a^{2n}\, b\, a^{3n} \mid n \geq 0\}$
(D) $\{a^n\, b\, a^{2n}\, b\, a^{3n} \mid n \text{ is an even number}\}$

46. Which of the following language is Regular?

(i) $\{w \mid w \in \{0, 1\}^*$ and w has prime number of 1's$\}$
(ii) $\{w \mid w \in \{0, 1\}^*$ and every odd position of w is 1$\}$
(iii) $\{w \mid w$ describes a valid Sudoku puzzle$\}$. Here $\Sigma = \{1, 2, 3, 4, 5, 6, 7, 8, 9, \text{Blank}\}$.
(iv) $\{w \in \Sigma^* \mid n_a(w) \bmod 4 = 1\}$.
Here $\Sigma = \{a, b\}$, and $n_a(w)$ is number of a's in the string 'w'.

(A) (i), (ii), (iii), (iv) (B) (ii), (iii), (iv)
(C) (ii), (iv) only (D) (i) only

47. Consider a standard pipeline with 5-Stages: Fetch (F), Decode (D), Execute (X),
Memory (M), Write back (W)
This 5-Stage pipeline is converted into a 4-stage pipeline by combining two stages.

Match list-A with list-B by identifying which improvement is obtained by combining which stages of the pipeline:

List-A		List-B	
1.	Combining D and X stages	P	Reduction in branch miss prediction penalty
2.	Combining X and M stages	Q	Reduction in Bypassing path
3.	Combining M and W stages	R	Elimination of load-to-use stall cycle
4.	Combining F and D stages	S	No need of branch target Buffer

(A) 1–P, 2–Q, 3–R, 4–S
(B) 1–S, 2–Q, 3–R, 4–P
(C) 1–P, 2–R, 3–Q, 4–S
(D) 1–S, 2–R, 3–Q, 4–P

48. During the design of a cache memory there are two kinds of choices available:
(i) A direct mapped cache with a hit latency of 3 clock cycles.
(ii) A set-associative cache with a hit latency of 4 clock cycles
In either case the miss penalty is 10 cycles.
If the set-associative cache is selected and it needs to provide lower average latency than direct mapped cache with 15% miss rate, then the miss rate of set-associative cache must be (less than in percentage) ________.

49. Consider a pipelined processor $P1$ with a cycle time of 10 ns. A Benchmark program executed on this processor, exhibited an average CPI of 1.2, the program has 10% branch instructions and branch prediction scheme accuracy is 90%. Every branch mis prediction costs 3 cycles delay on $P1$.
Now a new pipelined processor $P2$ is designed with cycle time of 9 ns and an increase in pipeline depth compared to $P1$. On $P2$, the penalty for branch misprediction is 5 cycles. If the benchmark program executed on $P2$, then the average CPI of $P2$ is ________.

50. Consider the following statements:
S_1: A Relation with 2 attributes does not have partial dependency and transitive dependency.
S_2: Query Retrieval performance will get reduced, if a relation is undergone with more number of normalizations.
S_3: BCNF mainly focuses on the primary key.
Which of the above statements is/are TRUE?
(A) Only S_1 (B) S_1 and S_2
(C) S_2 and S_3 (D) S_1, S_2, S_3

51. Construct a B-Tree of order 3 with the key values as given:
5, 10, 15, 20, 25, 30, 35, 40, 45, 50
The number of nodes at the last level is ________.

52. Consider a serial schedule (S)

T_1	T_2
Read (X)	
$X = X * 10$	
Write (X)	
Read (Y)	
$Y = Y + 100$	
Write (Y)	
	Read (X)
	$X = X - 1000$
	Write (X)
	Read (Y)
	$Y = Y * 20$
	Write (Y)

Consider the non-serial schedules S_1, S_2, S_3 for the above schedule 'S'.
$S1$:

T_1	T_2
Read (X)	
$X = X * 10$	
Write (X)	
	Read (X)
	$X = X - 1000$
	Write (X)
Read (Y)	
$Y = Y + 100$	
Write (Y)	
	Read (Y)
	$Y = Y * 20$
	Write (Y)

$S2$:

T_1	T_2
Read (X)	
$X = X * 10$	
	Read (X)
	$X = X - 1000$
Write (X)	
	Write (X)
Read (Y)	
$Y = Y * 20$	
	Read (Y)
	$Y = Y * 20$
Write (Y)	
	Write (Y)

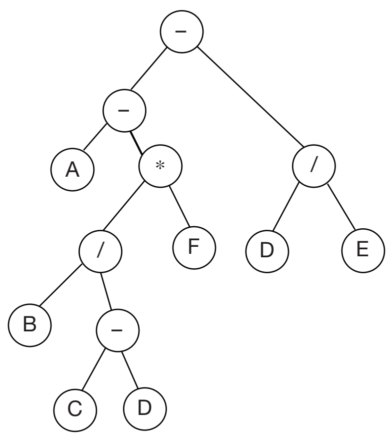
$S3$:

T_1	T_2
Read (X)	
$X = X * 10$	
Write (X)	
	Read (X)
	$X = X - 1000$
	Write (X)
Read (Y)	
$Y = Y + 100$	
	Read (Y)
	$Y = Y * 20$
Write (Y)	
	Write (Y)

Which of the above schedules (S_1, S_2, S_3) are view equivalent to serial schedule 'S'?

(A) Only S_1
(B) S_1 and S_2
(C) S_2 and S_3
(D) S_1, S_2, S_3

53. Consider the given expression tree:



Which of the following are correct Infix and Postfix expressions?

(A) $A - B/(C - D)*F - D/E$ and $ABCD/- F *- DE/-$
(B) $A/B - (C - D)*F - D/E$ and $ABCD -/F*- DE/-$
(C) $A - B/(C - D)*F - D/E$ and $ABCD -/F*- DE/-$
(D) $A - B/(C - D)*F/D - E$ and $ABCD -/F*- DE/-$

54. Consider an array containing 8 elements {36, 97, 44, 12, 58, 49, 11, 84}.
Implement three sorting algorithms on the above array: Bubble sort, Insertion sort, Selection sort.
Match the sorting algorithm with the intermediate result of an array after four passes or Iterations

Sorting algorithm	Intermediate result after 4-passes
(A) Bubble sort	(I) [11, 12, 36, 44, 49, 97, 58, 84]
(B) Selection sort	(II) [12, 36, 44, 97, 58, 49, 11, 84]
(C) Insertion sort	(III) [12, 36, 11, 44, 49, 58, 84, 97]
	(IV) [36, 11, 44, 12, 49, 58, 84, 97]
	(V) [11, 12, 36, 44, 58, 49, 97, 84]
	(VI) [12, 36, 44, 58, 97, 49, 11, 84]

(A) A–(I), B–(IV), C–(VI)
(B) A–(III), B–(IV), C–(VI)
(C) A–(I), B–(VI), C–(II)
(D) A–(III), B–(V), C–(II)

55. Number of labeled spanning trees of the complete bipartite graph $k_{3,3}$ is ________.

56. Consider the grammar:

$S \rightarrow abX$ {Print (0)}
$S \rightarrow c$ {Print (1)}
$X \rightarrow dS$ {Print (2)}

For this SDT construct, if the input string is "*a b d a b d c*", then the output is:

(A) 1 2 0 2 0
(B) 0 2 0 2 1
(C) 0 1 0 2 2
(D) 1 0 0 2 2

57. Consider the following grammar:

(P) $E \rightarrow T + E|T$
$T \rightarrow id$
(Q) $A \rightarrow (A)\,|a$
(R) $S \rightarrow Aba \mid Bb$
$A \rightarrow bAa \mid d$
$B \rightarrow d$

Which of the above grammar has both Shift-reduce and Reduce-Reduce Conflicts using LR(0) parsing algorithm?

(A) Only P
(B) Only Q
(C) Only R
(D) Both P, R

58. Match the following:

Group-A		Group-B	
P	Deadlock avoidance	1.	Cycle in the wait-for graph
Q	Deadlock prevention	2.	Safe state algorithm
R	Deadlock detection	3.	Allocate all the required resources before the start of process execution
S	Deadlock recovery	4.	Resource preemption
		5.	Bankers algorithm
		6.	Resource request algorithm

(A) P–2, Q–4, R–5, S–6
(B) P–5, Q–3, R–1, S–4
(C) P–5, Q–4, R–6, S–3
(D) P–2, Q–3, R–2, S–6

59. Which of the following statements is FALSE?

(A) Degree of multiprogramming in a system is independent of scheduling algorithm.
(B) Virtual memory size depends on the size of the address bus.
(C) Dynamic partition memory technique is affected with Internal fragmentation
(D) None of the above

60. A process has been allocated 4 page frames. Initially the page frames are empty. The process makes the following sequence of page references 1, 2, 3, 2, 1, 4, 6, 3, 4, 7, 3, 1, 2.
If optimal page replacement policy is used, then the number of page faults is ________.

61. Consider below table:

P–ID	Arrival time	Burst time	Priority
P_1	4	3	3
P_2	7	5	4(high)
P_3	1	6	1
P_4	2	5	2

If the processes are executed, using the scheduling algorithms–Round Robin with time slice 2 units (RR), preemptive shortest job first (P-SJF) Preemptive Priority scheduling (PP), then which of the following order specifies the correct order based on average response time (Ascending order)?

(A) RR, PP, P-SJF (B) P-SJF, RR, PP
(C) PP, RR, P-SJF (D) PR, P-SJF, PP

62. Consider the routine fun( ):

```
void fun(int x)
{
if (x > 0)
{
fun(x - 1);
printf("%d", x);
fun(x - 1);
}
}
```

When fun(4) is called, the number of function calls would be _________.

63. Suppose we have numbers between 1 and 1000 in a binary search tree and want to search for the number 364. Which of the following sequence could not be the sequence of nodes examined?

(A) 3, 253, 402, 399, 331, 345, 398, 364,
(B) 926, 203, 912, 241, 913, 246, 364
(C) 3, 400, 388, 220, 267, 383, 382, 380, 279, 364
(D) 936, 279, 346, 620, 347, 391, 359, 364

64. Consider a single linked list with '*n*' elements:

```
struct Node
{
struct Node *next;
int data;
} list;
Consider a routine fun():
struct Node *fun(list *head, int K)
{
struct node *P1, *P2;
P1 = P2 = head;
while ( I )
{
P2 = P2 → next;
if ( II )
return NULL;
K - -;
}
while ( III )
{
P1 = P1 → next;
P2 = P2 → next;
}
return P1;
}
```

Fill in the blanks, if fun ( ) gives the K^{th} node from the end of the list.

	I	II	III		I	II	III
(A)	P_1	P_2	K	(B)	$!P_2$	P_1	K
(C)	K	$!P_1$	P_2	(D)	$!P_2$	$P1$	K

65. A TCP machine is sending full windows of 65,535 bytes over a 1 Gbps channel that has 20 m sec one-way delay. What is the maximum throughput achievable?

(A) 1262645 bytes
(B) 1462625 bytes
(C) 1638375 bytes
(D) 1842625 bytes

Answer Keys

1. B	**2.** C	**3.** C	**4.** D	**5.** C	**6.** C	**7.** A	**8.** A	**9.** B	**10.** 6000
11. C	**12.** A	**13.** 0.5	**14.** 4,096	**15.** D	**16.** D	**17.** 42	**18.** D	**19.** B	**20.** A

HINTS AND EXPLANATIONS

1. The synonym of risque is lascivious or vulgar. Queasy means sickening and pompous means overdone or affected and have little to do with the headword. Choice (B)

2.

G	*O*	*O*	*G*	*L*	*E*
+1	–1	+1	–1	+1	–1
H	*N*	*P*	*F*	*M*	*D*

Similarly,

A	*P*	*P*	*L*	*E*
+1	–1	+1	–1	+1
B	*O*	*Q*	*K*	*F*

Choice (C)

3. The numbers a, b, c, d, e are in geometric progression.

$\therefore \quad \frac{b}{a} = \frac{c}{b} = \frac{d}{c} = \frac{e}{d}$ let each of these be k.

(i) $\frac{b^2}{a^2} = \frac{c^2}{b^2} = \frac{d^2}{c^2} = \frac{e^2}{d^2} = k^2$

$\therefore \quad a^2, b^2, c^2, d^2, e^2$ are in geometric progression.

(ii) The given terms need not be in geometric progression.

(iii) $\frac{3b}{3a} = \frac{3c}{3b} = \frac{3d}{3c} = \frac{3e}{3d} = k$

$3a$, $3b$, $3c$, $3d$, $3e$ are in geometric progression.
Only (i) and (iii) are in geometric progression.
Choice (C)

4. Utopia is a place where everything is perfect. Synagogue is a place of worship for Jews. Choice (D)

5. The pair conjunction "neither ... nor" always takes a plural verb with the plural subject being placed second. So "have" is apt. Choice (C)

6. $f(x) = 3 - |x|$ where $-2 \le x \le 2$,
$|a| = a$ when $a \ge 0$,
$= -a$ when $a < 0$,
$|x|$ ranges from 0 to 2.
$f(x)$ has the minimum and the maximum values when x has the maximum and the minimum values respectively.
Min $(f(x)) = 3 - 2 = 1$.
Max $(f(x)) = 3 - 0 = 3$. Choice (C)

7. The noun "machinery" is correct and it cannot be used in the plural with an "*s*". So the entire structure accompanying it has to be in the singular. Thus, "there is no machinery for ..." is apt. Choice (A)

8. Statement (B) is not true. The passage only states that he was a dictator "at heart", not a crowned and dreaded despotic ruler. Towards the end of the passage we are told of his beliefs regarding war. He came to believe that the conquest of the self was the greatest conquest. This DOES NOT mean he believed that men would shun violence and live peacefully. So (C) too is ruled out. (D) is ruled out as it is out of the text. Choice (A) is correct as per the first line of the passage. "... one of the ..." means not the only. Choice (A)

9.

Person	Designation
A	Head of R&D/Finance
B	Head of operations
C	Posted to work in all departments
D	Head of Finance/R&D
E	Head of Marketing

A valid assignment of heads to the domains can be.
A–Finance
B–Operations
D–R&D E–Marketing. Choice (B)

10. Total number of people using "Chuk–chuk for sure"

$= \frac{60}{360}(216000) = 36000$

Number of female customers of this company

$= \frac{1}{6}(36000) = 6000$ Ans: 6000

11. Given $f(x) = 5x^2 + \cos x$
The Taylor's series expansion of $f(x)$ about $x = a$ is:

$$f(x) = f(a) + 9x - a)f^1(a) + \frac{(x-a)^2}{2!}f^{11}(a) + \ldots\infty$$

$\therefore$ The third term is $\frac{(x-a)^2}{2!}f^{11}(a)$

Here $f(x) = 5x^2 + \cos x$ and $x = \pi$

$\Rightarrow \quad f^{11}(x) = 10 - \cos x$

$\therefore \quad f^{11}(a) = f^{11}(\pi) = 10 - \cos\pi = 11$

$\therefore$ The third term in the Taylor's series expansion of $f(x)$ about $x = \pi$ is $\frac{(x-\pi)^2}{2!} \times 11 = \frac{11}{2}(x-\pi)^2$

Choice (C)

12. Given, $AB = A \rightarrow (1)$
and $BA = B \rightarrow (2)$
From (1) $AB = A$
$\Rightarrow \quad (AB)A = A \times A$
$\Rightarrow \quad A(BA) = A^2$
$\Rightarrow \quad A(B) = A^2$ (from (2))
$\Rightarrow \quad A = A^2$ (from (1))
$\Rightarrow \quad A^2 = A \Rightarrow A$ is an idempotent matrix.
From (2), $BA = B$
$(BA)\,B = B \times B$
$\Rightarrow \quad B(AB) = B^2$
$\Rightarrow \quad B(A) = B^2$ (from (1))
$\Rightarrow \quad B = B^2$ (from (2))
$\Rightarrow \quad B^2 = B$
$\Rightarrow \quad B$ is an idempotent matrix. Choice (A)

13. Given the p.d.f of X is

$$f(x) = \begin{cases} ax(1-x) & 0 \le x \le 1 \\ 0 & \text{otherwise} \end{cases}$$

As $f(x)$ is a p.d.f of X, we have

$$\int_{-\infty}^{\infty} f(x)\,dx = 1 \Rightarrow \int_0^1 a(x - x^2)\,dx = 1$$

$$\Rightarrow \quad a\left[\frac{x^2}{2} - \frac{x^3}{3}\right]_0^1 = 1$$

$$\Rightarrow \quad a\left[\frac{1}{2} - \frac{1}{3}\right] = 1 \Rightarrow a\left(\frac{1}{6}\right) = 1$$

$$\Rightarrow \quad a = 6$$

$$\therefore \quad f(x) = \begin{cases} 6x(1-x) & 0 \le x \le 1 \\ 0 & \text{otherwise} \end{cases}$$

The mean of X is

$$E(X) = \int_{-\infty}^{\infty} xf(x)\,dx = \int_0^1 x(6x(1-x))\,dx$$

$$= 6\int_0^1 (x^2 - x^3)\,dx$$

$$= 6\left[\frac{x^3}{3} - \frac{x^4}{4}\right]_0^1 = 6\left[\frac{1}{3} - \frac{1}{4}\right] = \frac{6}{12}$$

$$\therefore \quad E(X) = \frac{1}{2}$$ Ans: 0.5

14. Given $S = \{k, l, m, n\}$

The number of ordered pairs in $S \times S = 16$

Of these 16 ordered pairs, the ordered pairs (k, k) (l, l) (m, m) and (n, n) must be present in every reflexive relation on S.

So, any reflexive relation on S contains these 4 ordered pairs along with any of the remaining 12 ordered pairs of $S \times S$.

$\therefore$ The maximum possible number of reflexive relations that can be defined on S

= The number of subsets of a set with 12 elements.

$= 2^{12} = 4{,}096$ Ans: 4,096

15. An induced subgraph H of a graph G is a subgraph of G that consists of all those edges of G which are present between every pair of vertices that are present in H.

Among the options given, graph G_4 is not an induced sub graph of G because in G there is an edge between the vertices a and d as well as an edge between c and g but those edges are not in G_4. Choice (D)

16. The maximum element in a min-heap will be resided in the leafs. The number of leaf's in heap of n-elements are $\left\lceil \frac{n}{2} \right\rceil$. So total number of comparisons required are $\left\lceil \frac{n}{2} \right\rceil - 1$. Choice (D)

17. The number of binary tree structures that can be formed with 'n' lables are $\left(\frac{{}^{2n}C_n}{n+1}\right)$ i.e., with 5 elements we can form $\left(\frac{{}^{10}C_5}{6}\right) = 42$ trees.

In these structures we can place the data elements, to get the in order traversal of the above order – PQRST.

Ans: 42

18. Choice (D)

19. Choice (B)

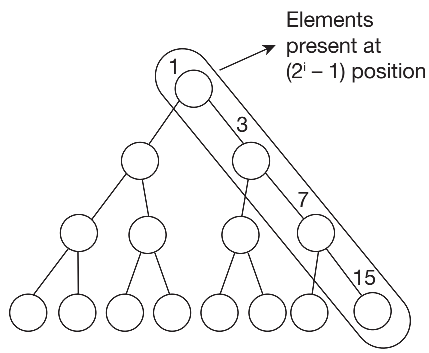
20. Follow (F) = {*, +, \$,)} Choice (A)

21. Preprocessing is optional. Symbolic names are associated with data or information.

Symbol table can be implemented using linear table, ordered list, tree and Hash table. Choice (C)

22. AVL Tree is a balanced binary search tree. The elements positioned at $(2^i - 1)$ places is nothing but right skewed tree elements [elements which are right child from root node onwards].

i.e., consider an example



Number of nodes in an AVL-Tree of 'n' nodes has $(\log n)$ elements for above scenario.

To search an element in $(\log n)$ elements using binary search, it takes $O(\log(\log n))$ time. Choice (A)

23. If a recurrence equation,

$T(n) = aT(n - b) + O(n^k)$, with $a > 0$, $b \ge 1$, $k \ge 0$.

The time complexity of $T(n)$ with $a > 1$, takes $O(n^k \cdot a^{n/2})$time.

So for the recurrence equation,

$T(n) = 3T(n-1) + O(n^2)$ takes

$O(n^2 \cdot 3^{n/2}) \gg O(3^n \cdot n^2)$. Choice (D)

24. The key is (XQ) Ans: 1

25. **<u>Option (A):</u>** Not valid

The Aggregate function SUM will work only on the numeric columns.

<u>Option (B):</u> Not valid

The Aggregate function will work on only single column and produce single column output.

<u>Option (C)</u> Not valid
If non-aggregate column associated with the aggregate column then that query must be associated with GROUP BY clause. Choice (D)

26. Choice (A)

27. An instruction cycle consists of instruction fetch, followed by 0 or more operand fetch, followed by 0 or more operand stores followed by an interrupt check. Choice (D)

28. $$\text{CPI} = \frac{4500\times1 + 3200\times2 + 1500\times2 + 800\times2}{10000}$$

$$= \frac{4500 + 6400 + 3000 + 1600}{10000} = \frac{15500}{10000} = 1.55$$

$$\text{MIPS} = \frac{\text{Clock rate}}{\text{CPI}\times10^6} = \frac{20\times10^6}{1.55\times10^6} = 12.9$$ Choice (B)

29. Instruction fetch, operand fetch, operand store requires some exchange between processor and either memory or I/O module. Remaining are done inside the processor. Choice (C)

30. To remove ε-Transition we have to add new transitions; we can reach q_2 from q_1 with 'ε' and from q_2 to q_1 with 1. i.e., q_1 will reach itself with input 1.
Similarly, q_0 can reach q_2 with input '0'. So a transition from q_0 to q_2 will be added. Choice (C)

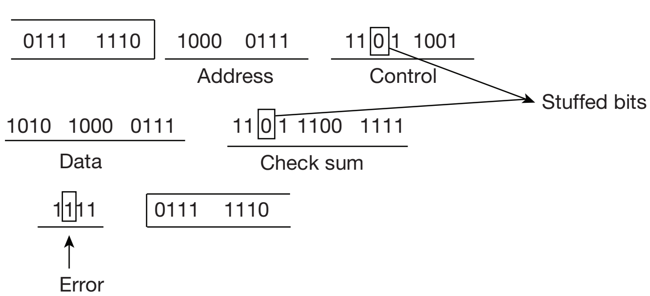
31. T must halt with Regular expression R. Choice (D)

32. The Host layers in OSI model are Transport, Session, Presentation and Application Layers. Choice (C)

33. The HDLC frame format is:

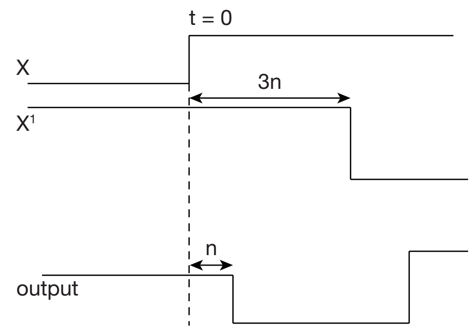
	8-bits	8-bits	≥0	16-bits	
0111 1110	Address	Control	Data	Check sum	0111 1110

The start and end of the frame are 0111 1110.
To differentiate start & end flags from data, a bit '1' is stuffed after 5 1's.



There is single error in given frame. Choice (C)

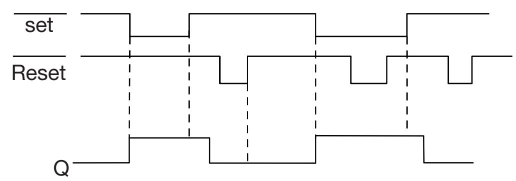
34. Consider the delay of each NAND gate is 'n' seconds. At $t = 0$, the logic LOW switched to logic HIGH
The wave forms will be as shown below.
X is input of NAND gate, other input will be X^1 which is complemented form of X, but delayed by $3n$. (n – delay of each NAND gate)



HIGH to LOW to HIGH Choice (D)

35. Given Latch is a $\bar{S}\bar{R}$ NAND gate latch.

$\overline{\text{Set}}$	$\overline{\text{Reset}}$	Q_{n+1}	Condition
0	0	X	($Q_{n+1} = 1, \bar{Q}_{n+1} = 1$)
0	1	1	Set
1	0	0	Reset
1	1	Q_n	Same State



Choice (B)

36. Given, 1, 4 and 5 are the eigenvalues of A.
∴ The eigenvalues of $A^2 - 5A + 6I_3$ are $1^2 - 5\times1 + 6 = 2$, $4^2 - 5\times4 + 6 = 2$ and $5^2 - 5\times5 + 6 = 6$.
Hence, the eigenvalue of $A^2 - 5A + 6I_3$ are 2, 2 and 6
∴ $A^2 - 5A + 6I_3$ has two distinct eigenvalues. Choice (B)

37. <u>Consider option (A):</u>
$(p \wedge q) \to [(p \vee q) \vee (\rceil p \wedge \rceil q)]$
$\Leftrightarrow (p \wedge q) \to [(p \vee q) \vee \rceil(p \vee q)]$
$(\because \rceil(A \vee B) \Leftrightarrow (\rceil A \wedge \rceil B)$
$\Leftrightarrow \rceil(p \wedge q) \vee T$
$(\because A \to B \Leftrightarrow \rceil A \vee B$ and $A \vee \rceil A \Leftrightarrow T$ = tautology)
$\Leftrightarrow T$ = Tautology ($\because A \vee T \Leftrightarrow T$)
<u>Consider (B):</u>
$[p \wedge (q \vee r)] \vee [\rceil p \vee (\rceil q \wedge \rceil r)]$
$\Leftrightarrow [p \wedge (q \vee r)] \vee [\rceil p \vee \rceil(q \vee r)]$
$(\because \rceil(A \vee B) \Leftrightarrow (\rceil A \wedge \rceil B))$
$\Leftrightarrow [p \wedge (q \vee r)] \vee \rceil[p \wedge (q \vee r)]$
$\Leftrightarrow T$ = Tautology ($\because A \vee \rceil A \Leftrightarrow T$)
<u>Consider (C):</u>
$[(p \vee q) \to r] \leftrightarrow [\rceil r \to \rceil(p \vee q)]$
$\Leftrightarrow [(p \vee q) \to r] \leftrightarrow [(p \vee q) \to r]$
$(\because A \to B \Leftrightarrow \rceil B \to \rceil A)$
$\Leftrightarrow T$ = Tautology ($\because A \leftrightarrow A \Leftrightarrow T$)

Consider (D):
$[p \to (q \to r)] \wedge [\rceil p \vee q \vee r]$
When p is true, q is true and r is false
$p \to (q \to r)$ is false.
$\therefore$ $[p \to (q \to r)] \wedge [\rceil p \vee q \vee r]$ is false.
Hence $[p \to (q \to r)] \wedge [\rceil p \vee q \vee r]$ is NOT a tautology. Choice (D)

38. Let X_1, X_2 and X_3 denote the number appeared on the die in the first, second and third rolls respectively.
$\therefore$ X_1, X_2 and X_3 take the values 1, 2, 3, 4, 5 and 6 with equal probability $\frac{1}{6}$.
$\therefore$ $E(X_1) = E(X_2) = E(X_3)$

$$= 1\times\frac{1}{6} + 2\times\frac{1}{6} + 3\times\frac{1}{6} + 4\times\frac{1}{6} + 5\times\frac{1}{6} + 6\times\frac{1}{6} = \frac{7}{2}$$

$\therefore$ The expected value of the product of numbers that appear on the die when rolled thrice
$= E(X_1\, X_2\, X_3) = E(X_1) \cdot E(X_2) \cdot E(X_3)$

$$= \frac{7}{2}\times\frac{7}{2}\times\frac{7}{2} = \frac{343}{8}$$ Choice (C)

39. Given $f(x) = (x-1)^2\, e^{-x}$
$f'(x) = 2(x-1)e^{-x} - (x-1)^2\, e^{-x}$
$f'(x) = (x-1)\,(3-x)e^{-x} = (4x - x^2 - 3)e^{-x}$
$f'(x) = 0 \Rightarrow (x-1)\,(3-x)e^{-x} = 0$
$\Rightarrow$ $(x-1)\,(3-x) = 0$
$\Rightarrow$ $x = 1; x = 3$
And $f''(x) = (4-2x)e^{-x} - (4x - x^2 - 3)e^{-x}$
$= (x^2 - 6x + 7)\, e^{-x}$

At $x = 1, f''(x) = 2e^{-1} = \frac{2}{e} > 0$

At $x = 3; f''(x) = -2e^{-3} = \frac{-2}{e^3} < 0$

$\therefore$ $f(x)$ has a local maximum at $x = 3$
$\therefore$ The maximum value of

$f(x)$ at $x = 3$ is $f(3) = (3-1)^2\, e^{-3} = \frac{4}{e^3}$

$= 0.1991$

Ans: 0.18 to 0.20

40. Given $A = \begin{bmatrix} -1 & 0 \\ 0 & -1 \end{bmatrix}$, $B = \begin{bmatrix} 0 & -1 \\ 1 & 0 \end{bmatrix}$, $C = \begin{bmatrix} 0 & 1 \\ -1 & 0 \end{bmatrix}$

and $I = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$

And $G = \{A, B, C, I\}$
As the binary operation is "matrix multiplication",

$I = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$ is the identity element of G

$\therefore$ I can't be a generator of G.

Consider $A^2 = \begin{bmatrix} -1 & 0 \\ 0 & -1 \end{bmatrix}\begin{bmatrix} -1 & 0 \\ 0 & -1 \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} = I$

$\Rightarrow$ $S(A) = 2$
$\therefore$ A can't be a generator of G, because the order of the generator of a cyclic group is same as that of the order of G.
Also, one can observe that
$B^2 = A$, $B^3 = C$, and $B^4 = I$; $C^2 = A$, $C^3 = B$ and $C^4 = I$
Hence, B and C are the generators of the cyclic group G under matrix multiplication.

Choice (B)

41. $F(x, y, z) = \Sigma m(0, 6, 7) + \phi(1, 4)$

X \ YZ	00	01	11	10
0	1	D		
1	D		1	1

$F = \bar{X}\bar{Y} + XY = X \odot Y$
F is 2 input X NOR gate, so we need 4 NOR gates.

Choice (B)

42. Propagation delay = 100 ms
Round-trip delay = 200 ms
File size = 10 MB
Frame size = 1 KB

Frames required to send the file $= \frac{10\times10^6}{1\times10^3} = 10000$

Time to send 10000 frames

$= \frac{10000}{5} * 200$ ms

$= 2000 * 200$ ms $= 400$ seconds

Throughput of $A = \frac{\text{File Size}}{\text{Time Required to send file}}$

$= \frac{10\text{ MB}}{400\text{ s}} = 0.025$ MBps $= 25$ KBps Ans : 25

43. (i) Even if P_1 calls close(), the OS will transmit data to P_2.
(ii) The OS will send FIN (finish) to P_1
(iii) The receive () function will be called multiple times to receive the entire data.
(iv) P_2's receive will return a zero to indicate an end of stream. Choice (D)

44. Given message can be written as:
1101 1001 0101 1001
CRC generator is 1010 01001
We need to put 8 zeros next to the message and perform modulus division with given CRC generator.

```
                                  11  1001  1101  0100
              -----------------------------------------
101001001 )  1101  1001  0101  1001  1101  0100
             1010  0100  1
             -----------------------------------------
             0111  1101  11
              101  0010  01
             -----------------------------------------
              010  1111  100
               10  1001  001
             -----------------------------------------
               00  0110  1011
                0  0000  0000
             -----------------------------------------
                   0110  1011  1
                   0000  0000  0
             -----------------------------------------
                    110  1011  10
                    101  0010  01
             -----------------------------------------
                     11  1001  110
                     10  1001  001
             -----------------------------------------
                      1  0000  1111
                      1  0100  1001
             -----------------------------------------
                         0100  0110  0
                         0000  0000  0
             -----------------------------------------
                          100  0110  00
                          101  0010  01
             -----------------------------------------
                           01  0100  010
                           00  0000  000

             -----------------------------------------
                                  0  1101  0000
                                  0  0000  0000
             -----------------------------------------
                                     1101  0000
             -----------------------------------------
```

$\therefore$ The check sum that will be placed after the message is 11010000 Ans : 11010000.

45. Given turing machine writes a Blank in first 'a' position and traverses next a's, b's and #'s. Again replaces two a's with #'s and traverses next a's, b's and #'s; Again replaces 3 a's with #'s. So the language accepted is $\{a^n\, b\, a^{2n}\, b\, a^{3n} \mid n \geq 0\}$ Choice (C)

46. (i) Regular languages do not count prime number of 1's (by using its limited storage).
(ii) We can design a FA which accepts the strings such that every odd position is 1. So it is regular.
(iii) Sudoku is finite. So it is regular.
(iv) We can design a FA, in which number of a's is 1, 5, 9, 13 etc. so (iv) is regular. Choice (B)

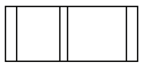
47. Combining D and X stages reduces miss prediction penalty, (Penalty reduce from 2 to 1). Combining X and M stages eliminates load-to-use stall cycle. (No stall to use a load value).
Combining M & W stages, will reduce By Pass Path.
By Combining F & D stages, BTB is not required to determine the branch instruction. Choice (C)

48. Average latency of direct mapped cache with 15% miss rate
$= (3 + 0.15 * 10) = 3 + 1.5 = 4.5$ cycles
Average latency of set associative cache with miss rate 'x' is $(4 + x * 10) = 4.5$
$x * 10 = 0.5$
$\Rightarrow \quad x = 0.05 = 5\%$ Ans: 5

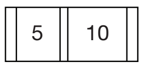
49. CPI on $P1 = 1.2$
CPI on $P2 = 1.2 + 0.1 * 0.1 * (5 - 3)$
$= 1.2 + 0.01 * 2$
$= 1.2 + 0.02 = 1.22$
($\therefore$ 10% of branch instructions, 10% mis-predictions and 5 cycles penalty). Ans: 1.22

50. BCNF mainly focuses on the candidate keys.
Choice (B)

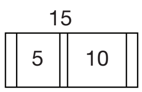
51.

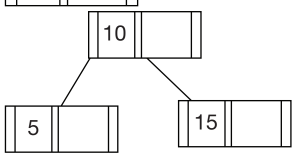


Insert: 5, 10

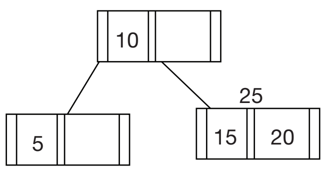


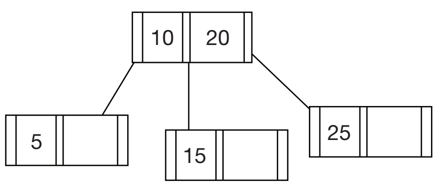
Insert : 15



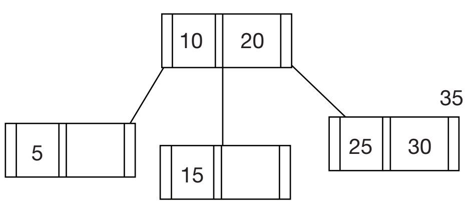


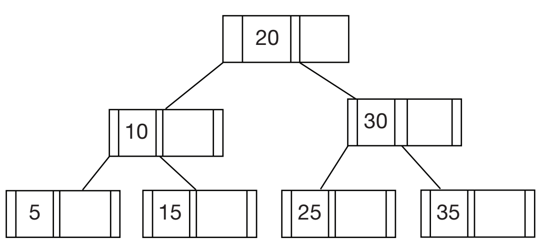
Insert: 20, 25



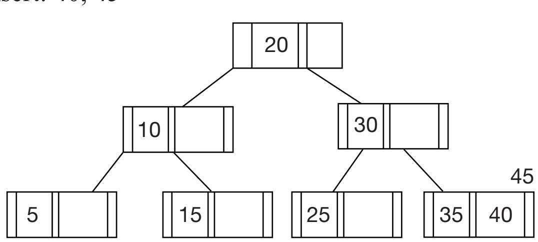


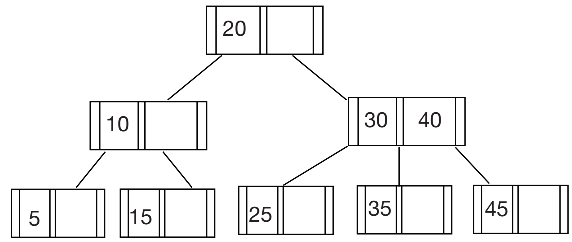
Insert: 30, 35



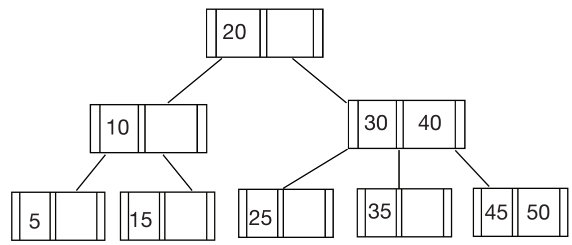


Insert: 40, 45





Insert: 50



Number of nodes at last level are 5. Ans: 5

52. Choice (A)

53. Post-fix order = Traverse left sub trees, Right sub tree and then Root
Infix order = Traverse left sub tree, Root and then Right sub tree Choice (C)

54. The input is 36, 97, 44, 12, 58, 49, 11, 84
<u>Bubble sort:</u>
<u>1st pass</u>
<u>36, 97</u> 44, 12, 58, 49, 11, 84

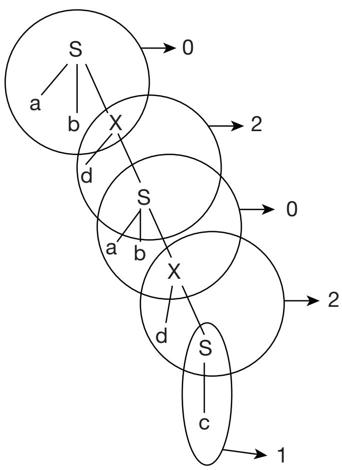
4^{th} pass

$\boxed{12, 36, 44, 97}$, 58, 49, 11, 84 Choice (D)

55. Number of labeled spanning trees of the complete bipartite graph k_{mn} is $m^{n-1} \cdot n^{m-1}$.
For $k_{3,3}$, the number of labeled spanning trees will be $3^{3-1} \cdot 3^{3-1} = 81$. Ans: 81

56. Input string *a b d a b d c*



The output is 1 2 0 2 0 Choice (A)

57. (P) Has SR conflict
(Q) Q is a LR(0) grammar
(R) Has both RR and SR conflicts Choice (C)

58. Choice (B)

59. Choice (C)

60.

4	4	4	2
3	3	3	3
2	6	7	7
1	1	1	1
4 PF	1 PF	1 PF	1 PF

Ans.: 7

61. Preemptive SJF

//////	P_3	P_3	P_3	P_3	P_1	P_4	P_2

0 1 2 3 4 7 10 15 20

$$\text{Average response time} = \frac{7+15+1+10}{4} = 8.25$$

Preemptive priority scheduling:

//////	P_3	P_4	P_1	P_2

0 1 2 4 7

$$\text{Average response time} = \frac{4+7+1+2}{4} = 3.5$$

Round Robin Scheduling

//////	P_3	P_4	P_3	P_1	P_4	P_2	

0 1 3 5 7 9 11 13

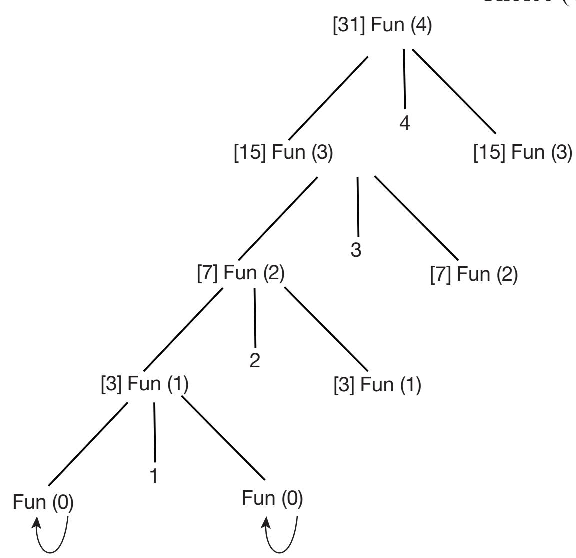
Ready Queue:

$\cancel{P_4}, \cancel{P_3}, \cancel{P_1}, \cancel{P_4}, P_2, P_3, P_1, P_4$

$$\text{Average response time} = \frac{7+11+1+3}{4} = 5.5$$

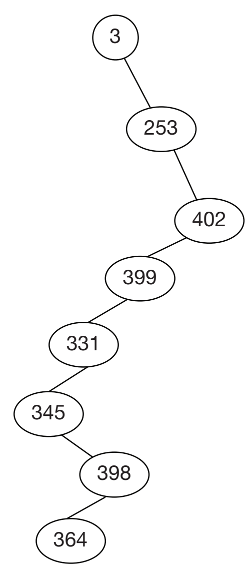
Choice (C)

62.

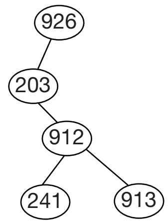


[*x*] specifies number of function calls of the functions.
Ans: 31

63. Option (A)



Option (B)



913 is violating node. Choice (B)

64. Choice (C)

65. One window can be sent for every 40 m sec

1 window ——— 40×10^{-3} sec

x ——————— 1 sec

$$x = \frac{1}{40 \times 10^{-3}} = \frac{10^3}{40}$$

$$= \frac{1000}{40} = 25$$

Per one second 25 windows can be sent, maximum rate of ($25 \times 65, 535$) bytes can be sent in a second. i.e., 1638375. Choice (C)

Mock Test 3

Number of Questions: 65 **Total Marks: 100**

Wrong answer for *MCQ will result in negative marks*, *(–1/3)* for *1 Mark Questions and (–2/3)* for *2 Marks Question.*

General Aptitude

Number of Questions: 10 **Section Marks: 15**

***Directions for question 1*:** Select the pair that best expresses a relationship similar to that expressed in the pair:

1. Road : Footpath
(A) Drawing room : Kitchen
(B) River : Riverbank
(C) Box : Lock
(D) Window : Shutter

***Directions for questions 2 and 3*:** Select the correct alternative from the given choices.

2. What is the total weight of 25 discs?
Statements:
I. Two-fifth of the weight of a disc is 13 kg.
II. The weights of no two discs are equal.
(A) Statement I alone is sufficient.
(B) Statement II alone is sufficient.
(C) Combining I and II sufficient.
(D) Both statements I and II together are not sufficient.

3. A function $f(x)$ is linear and has a value of 50 at $x = -4$, and a value of 6 at $x = 7$. The value of the function at $x = 8$ is ________.

***Directions for question* 4:** Fill in the blank with the correct idiom or phrase:

4. An upholder of the truth will never hesitate _________ .
(A) to let the grass grow under one's feet
(B) to see red
(C) to throw in the towel
(D) to call a spade a spade

***Directions for question 5*:** Select the correct alternative from the given choices.

5. The five corporate offices of *HUL* are located in five metros namely *A*, *B*, *C*, *D* and *E*. *E* is 5 km to the North-east of *A*, and is 2 kms to the South-east of *B*. *D* is 5 km to the North-east of *B*. *DE* = _______.
(A) 6.92 km (B) 29 km
(C) 47.27 km (D) 5.39 km

***Directions for question* 6:** Out of the four sentences, select the most suitable sentence with respect to grammar and usage:

6. (A) In the olden days, people used to worship the nature.
(B) In the olden days, people used to be worshipping nature.
(C) In the olden days, people worshipped nature.
(D) In the olden days, people used to be worshipping the nature.

Directions for question 7: Read the following paragraph and choose the correct statement:

7. One can understand, although one cannot excuse, a frightened person misbehaving, even though there was no real reason for his fright. But what amazed and angered India was the contemptuous justification of the deed when General Dyer, who had been responsible for the firing at Amritsar, and his subsequent barbarous neglect of the thousands of wounded. "That was none of my business", he had said. Some people in England and in the British government mildly criticized Dyer, but the general attitude of the British people was displayed in a debate at the House of Lords, in which praise was showered on him. All this fed the flame of wrath in India, and a great bitterness rose all over the country.
(A) General Dyer is an example of a frightened person misbehaving.
(B) The general attitude of the British people was displayed in the fact that the victims of the massacre received a fair trial.
(C) When the British government saw a great movement uprising in India, their fears grew.
(D) General Dyer's actions can neither be understood nor excused.

Directions for questions 8: The following question is based on a short argument, a set of statements, or a plan of action. For each question, select the best answer from the given choices.

8. The coolant Freon used in refrigerators was found to damage the ozone layer of the earth. Hence an urgent need was felt to substitute Freon with some other coolant which will not damage the ozone layer.
Which of the following can be a direct inference from the above statements?
(A) A coolant cheaper than Freon is available for use in the refrigerator.
(B) Coolants which do not have any damaging effects are available for use in the refrigerators.
(C) The ozone layer is on the verge of extinction.
(D) Preserving the ozone layer intact is essential for the inhabitants of the earth.

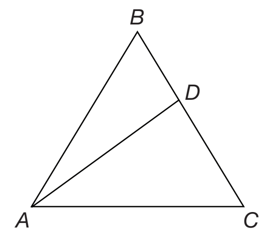
Directions for question 9: In the following question, the first and the last sentence of a passage are in order and numbered 1 and 6. The rest of the passage is split into 4 parts and numbered 2, 3, 4 and 5. These 4 parts are not arranged in the proper order. Read the sentences and arrange them in a logical sequence to make a passage and choose the correct sequence from the given options.

9. 1. Upon the same tree there are two birds of beautiful plumage, most friendly to each other.
2. This is the picture of the human soul.
3. One of the birds is eating fruits noisily while the other is sitting calm and silent without eating.
4. But the other one on top is calm and majestic.
5. The one on the lower branch is eating sweet and bitter fruits and is becoming sad and happy by turns.
6. Man is eating sweet and bitter fruits of this life, pursuing gold, sensory pleasures and the vanities of life so he is immersed in sorrow.

(A) 2, 4, 5, 3 (B) 3, 5, 4, 2
(C) 3, 4, 5, 2 (D) 5, 4, 3, 2

Directions for question 10: Select the correct alternative from the given choices.

10.



In triangle ABC, AD is the angle bisector of $\angle BAC$. $\angle CAD = 60°$ $AB = 10$ cm and $CA = 12$ cm. Find the length of AD.

(A) 5 cm (B) 5.45 cm
(C) 4.55 cm (D) 4.03 cm

Computer Science Engineering

Number of Questions: 55 **Section Marks: 85**

Directions for questions 11 to 65: Select the correct alternative from the given choices.

11. If 10 apples are to be distributed among Mahesh, Naresh and Ramesh, then the probability that Mahesh and Naresh together get exactly 7 apples is ______.

(A) $\left(\frac{2}{3}\right)^{10}$ (B) $15\times\left(\frac{2}{3}\right)^{10}$
(C) $5\times\left(\frac{2}{3}\right)^{10}$ (D) $3\times\left(\frac{2}{3}\right)^{10}$

12. If p and q are any two statement variables and T_o and F_o denote tautology and contradiction respectively, then which of the following is NOT equivalent to p?

(A) $p \wedge (p \vee q)$ (B) $p \wedge T_o$
(C) $p \wedge F_o$ (D) $p \vee (p \wedge q)$

13. The value of the definite integral $\int_1^5 \frac{\sqrt{x+5}}{\sqrt{x+5}+\sqrt{11-x}}\,dx$ is ______.

14. For a non-empty set L, if $(L, *, \oplus)$ is a lattice with $*$ and $\oplus$ as binary operations on L and if $a, b, c \in L$, then which of the following NEED NOT be true?

(A) $a * b = b * a$
(B) $a \oplus (b \oplus c) = (a \oplus b) \oplus c$
(C) $a * (a \oplus b) = a$
(D) $a \oplus (b * c) = (a \oplus b) * (a \oplus c)$

15. Consider two automobile companies Alpha Motors and Beta Motors that manufacture the bikes "Zigma" and "Harze" respectively. Zigma comes in three models, six colours, four engine sizes and two transmission types where as Harze comes in four models, five colours, three engine sizes and two transmission types. If Rakesh wants to buy a bike that is either a Zigma or a Harze, then different choices for him is the number of ______.

16. What is the number of distinct binary trees with 3 nodes (labelled as A, B, C) when traversed in post-order gives the sequence B, C, A?

(A) 2 (B) 3
(C) 4 (D) 5

17. What is the time complexity of the following Recurrence relation?

$$T(n) = \begin{cases} 2 & \text{if } n = 1 \\ 3T\left(\frac{n}{4}\right) & \text{if } n > 1 \end{cases}$$

(A) $\theta(n)$
(B) $\theta(\log n)$
(C) $\theta(n \log n)$
(D) $\theta(n^{3/4})$

18. Consider the following:

I. Multi-valued attributes must be represented by separate relations.
II. Composite attributes are represented only by their simple component attributes in the basic relational model.

Which of the following is TRUE?

(A) I is related to 1NF
(B) II is related to 2NF
(C) I and II are related to 1NF
(D) I is related to 2NF

19. A transaction T_1 updates item A and then fails before completion, so the system must change A back to its original value. Before it can do so, Transaction T_2 reads the temporary value of A, which will not be recorded permanently in the database because of failure of T_1. The problem described above is _______.
(A) The lost update problem
(B) Dirty Read problem
(C) The Incorrect summary problem
(D) Unrepeatable read problem

20. Consider a disk with following specifications:
Block size = 512 bytes
Inter block gap size = 64 bytes
Blocks per track = 20
Tracks per surface = 400
What is the total capacity of a track?
(A) 10240 bytes
(B) 1280 bytes
(C) 11520 bytes
(D) 11250 bytes

21. Consider an m-way set-associative cache with 's' number of slots (or blocks), with a block size of 'b' bytes. The main memory address has n-bits. Then which of the following gives the number of tag bits in the address?
(A) $n - \log(s/m) - \log(b/m)$
(B) $n - \log b$
(C) $n - \log s - \log b$
(D) $n - \log(s/m) - \log b$

22. The bus cycle time of a 32-bit micro-processor is same as that of a 16-bit microprocessor. The instructions and operands mix has 20% of 32-bit long instructions, 50% of 16-bit long and 30% of 8-bit long. The percentage of improvement achieved by fetching these instructions and operands with 32-bit microprocessor over 16-bit micro processor (specify two places after decimal point) is _______.

23. Consider the set of all words over the alphabet $\{a, b, c\}$ where the number of b's is not divisible by 3 or 5 and no 'c' appears after 'a'. This language is:
(A) Regular
(B) Context-free but not regular
(C) Recursive but not context-free
(D) Recursively enumerable but not Recursive

24. Let L_1 and L_2 are languages over an alphabet Σ such that $L_1 \subseteq L_2$. Then which of the following is always TRUE?
I. If L_2 is regular, then L_1 must be regular.
II. If L_1 is regular, then L_2 must be regular.
III. Either both L_1 and L_2 are regular or L_1, L_2 are Not Regular.
(A) I only (B) II only
(C) I, III only (D) None of these

25. Consider the CRC generator function:
$x^{10} + x^9 + x^6 + x^3 + 1$
The (maximum) number of bits in the resulting frame check sequence will be ______.

26. Consider an Ethernet wire which has a propagation speed of 2×10^8 m/s. If the size of network is 1000 m and data transmission rate is 100 Mbits/sec, then the minimum packet size needed to detect collision is ______.

27. Consider the code fragment:
```
i = 0 ;  j = 0 ;  k = 0 ;
for (x =1; x < = 100;  x = x + 1)
{
k = k + x ;
if ((x % 2) = = 0)
{
i = i + x;
}
else
{
j = j + x;
}
}
```
The value of 'k' at the end of the loop will be:
(A) $k < i + j$ (B) $k > i + j$
(C) $k = i + j$ (D) none of the above

28. Consider a complete graph 'G' of 8 vertices. Simple path in a graph is one in which no vertex is repeated. Let x, y, z be 3 distinct vertices in 'G'. The simple paths from x to y going through 'Z' will be ______.

29. Consider a lower triangular matrix $A[10][10]$ (array indices starts from 1), if the elements are stored in Row major order and each data element takes 1 byte of storage. If the base address is 1000, then the address of $A[8][3]$ is _______.

30. Consider the logical address space of 16 pages of 1024 bytes each, mapped onto a physical memory of 64 frames. How many bits are there in logical address?
(A) 4 (B) 10
(C) 14 (D) 6

31. Consider the page references 1, 3, 5, 6, 3, 1, 3, 5
Assume that main memory can accommodate 3 pages and the main memory already has the pages 1 and 3 with page 1 having been brought earlier than page 3. If LRU algorithm is used, then number of page faults that occur would be ______.

32. Consider the following three address code:
(1) $x = 1$ (2) $y = 1$
(3) if $x > i$ goto (9) (4) $y = y * x$
(5) $y = 10$ (6) $t = y * x$
(7) $x = t$ (8) goto (3)
(9) END
The number of basic blocks for above code is ______.

33. Which of the following statement is FALSE?

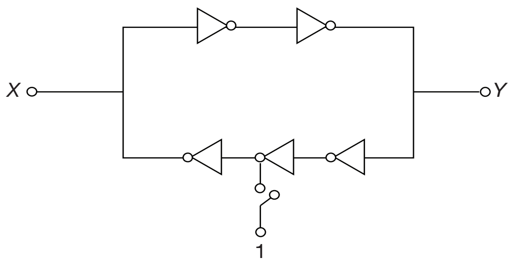
(A) In L-Attributed Syntax Directed Translations (SDT) attributes are evaluated using Depth first Search (Right to left) process.

(B) Every L-attribute can be converted into S-attribute.

(C) In S-attributed SDT, attributes are evaluated during Top down (or) Bottom up parsing.

(D) None of the above

34. In the circuit shown below, the switch is momentarily closed and then opened. Assuming the logic gates to have equal non-zero delay, at steady state, the logic states of X and Y are:



(A) X is latched to 0, Y is latched to 0

(B) X is latched to 0, Y toggles continuously

(C) X toggles continuously, Y is latched to 0

(D) X and Y both toggle continuously

35. A semi-conductor RAM has 16 bit address register and an 8 bit data register. The total number of bits in the memory is:

(A) 1,024 bits

(B) 4,096 bits

(C) 5,24,288 bits

(D) 10,48,576 bits

36. If $P = \begin{bmatrix} 2 & 131 & -243 & 566 \\ 0 & -2i & 174 & -237 \\ 0 & 0 & 2i & 0 \\ 0 & 0 & -713 & -2 \end{bmatrix}$ then which of the following is equal to $16P^{-1}$, where P^{-1} is the inverse of the matrix P?

(A) P^2 (B) $P^2 + 16P$

(C) P^3 (D) $P^3 + 16P^2 + P$

37. In a PSU (Public Sector Undertaking), if an employee is selected at random, then

(i) Probability that the employee has a Two Wheeler (TW) or a Four Wheeler (FW) is $\frac{7}{10}$

(ii) Probability that the employee has both a TW and a FW is $\frac{2}{5}$ and

(iii) Probability that the employee has a TW given that the employee has a FW is $\frac{2}{3}$.

Then the probability that the randomly selected employee has a TW is _______.

(A) $\frac{3}{5}$ (B) $\frac{1}{2}$

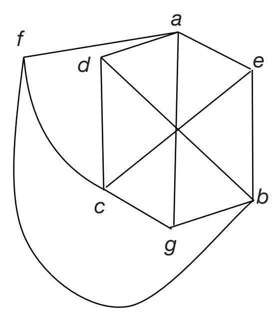
(C) $\frac{1}{3}$ (D) $\frac{1}{4}$

38. In a men's hostel of a central university, out of 200 students who can speak atleast one of the three languages viz., Hindi, Punjabi and Gujarati, 120 students can speak Hindi, 35 students can speak both Hindi and Punjabi and 40 students can speak both Hindi and Gujarati but can't speak Punjabi. Then the number of students who can speak only Hindi is _______.

(A) 45 (B) 30

(C) 40 (D) 25

39. The chromatic number of the following graph G is _______.



G

40. Which of the following two statements is/are TRUE?

P: If $f(x)$ is continuous in $[a, b]$ then $f(x)$ assumes every value between $f(a)$ and $f(b)$

Q: If a function $f(x)$ assumes every value between $f(a)$ and $f(b)$, then $f(x)$ is continuous in $[a, b]$.

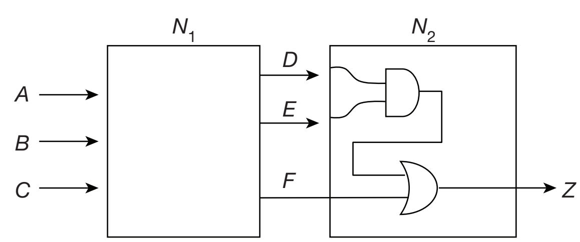
(A) P only

(B) Q only

(C) Both P and Q

(D) Neither P nor Q

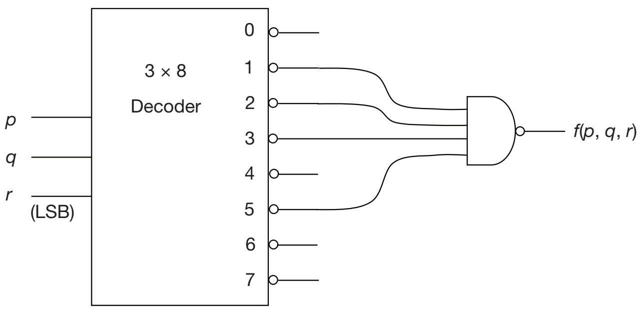
41. A combinational circuit is divided into two sub sections N_1 and N_2 as shown. The truth table of N_1 is given. Assume that the input combinations ABC = 101, and ABC = 001 never occur. Find the output expression for Z.



A	B	C	D	E	F
0	0	0	0	0	1
0	0	1	1	0	0
0	1	0	1	1	0
0	1	1	1	1	1
1	0	0	0	0	0
1	0	1	1	0	1
1	1	0	0	1	1
1	1	1	0	1	0

(A) $\overline{A}B + \overline{A}\overline{C} + B\overline{C}$ (B) $\overline{A} + \overline{B}C$
(C) $\overline{A} + B\overline{C}$ (D) $\overline{A} + \overline{B}C + B\overline{C}$

42. A 3 line to 8 line Decoder with active low outputs is used to implement a 3-variable Boolean function, as shown in the figure.
The simplified form of Boolean function $f(p, q, r)$ implemented in "sum of Products" form will be?



(A) $p^1q + pr^1$ (B) $pq + q^1r^1$
(C) $p^1q + q^1r + p^1r$ (D) $p^1q + q^1r$

43. Consider the following grammars:
$G1$:
$S \rightarrow (S)\ I\ a$
$G2$:
$X \rightarrow X(X)\ I\ x$
$G3$:
$X \rightarrow (Y)\ I\ x$
$Y \rightarrow Y, X\ I\ X$
$G4$:
$S \rightarrow Xx\ Xy\ I\ Yx\ Yy$
$X \rightarrow \in$
$Y \rightarrow \in$
$G5$:
$S \rightarrow Sx\ Sy\ I\ S\ y\ S\ x\ I\ \in$
Which of the above grammars are unambiguous?
(A) $G1, G2, G3$ (B) $G1, G4, G5$
(C) $G1, G3, G5$ (D) $G1, G2, G3, G5$

44. Consider the grammar G:
$S \rightarrow Xx$
$S \rightarrow yXz$
$S \rightarrow Yz$
$S \rightarrow yYx$
$X \rightarrow p$
$Y \rightarrow p$

Consider the statements:
(I) Grammar (G) is LL(1).
(II) Grammar G is SLR(1).
(III) Grammar G is CLR (1).
Which of the above statements is/are TRUE?
(A) only (I) (B) (II) and (III)
(C) only (III) (D) (I) and (III)

45. Consider two processes P_1 and P_2. There is a need to synchronize these processes using binary semaphores M_1, M_2, M_3.

Process P_1:	**Process P_2:**
$P(M1)$	A;
$P(M2)$	B;
$P(M3)$	C;

Process P_1: Process P_2:
$P(M1)$ A;
$P(M2)$ B;
$P(M3)$ C;
C.S /* critical section*I C.S
$V(M1)$ A;
$V(M2)$ B;
$V(M3)$ C;

$V(M1)$	A;
$V(M2)$	B;
$V(M3)$	C;

Number of possibilities to fill at A, B, C using binary semaphore in order to not to have Deadlock and synchronize among processes is _______.

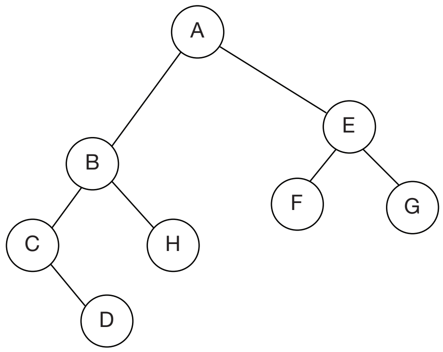
46. Consider a system in which a directory entry can store up to 32 disk block addresses for a file no larger than 32 blocks, the 32 addresses serve as the files index table. For files larger than 32 blocks, the addresses point to indirect blocks which in turn point to 512 file blocks each. Block size is 1024 bytes. The largest file size (in MB) is ______.

47. Consider the following:

Pid	Arrival time	Burst time
P_1	0	8
P_2	2	6
P_3	4	4
P_4	6	2

If Round Robin scheduling (with time slice = 3 units) preemptive SJF, and Highest Response Ratio Next (HRRN) were used. Which of the following specifies correct (ascending) order with respect to average turnaround time?
(A) RR, PSJF, HRRN
(B) P-SJF, HRRN, RR
(C) P-SJF, RR, HRRN
(D) RR, HRRN, P-SJF

48. Consider a Binary Tree



Consider the code fragment:

```
struct BTnode
{
struct BTnode *LC;
int data;
struct BTNode *RC;
}
void fun (struct BTnode *t)
{
if(t)
{
fun (t → LC)
printf ("%d", t →data):
fun (t → RC);
}
}
```

If the root node is passed as parameter to routine fun( ), the output is

(A) AEFGBCDH (B) FEGACDBH
(C) CDBHAFEG (D) FEGCDBHA

49. Consider a binary tree T on 200 vertices. let n_i be the number of vertices in T which have exactly i neighbours. Let $x = \sum_{i=1}^{200} i \cdot n_i$ then the value of x will be:

(A) 199 (B) 398
(C) $199 < x < 398$ (D) None of the above

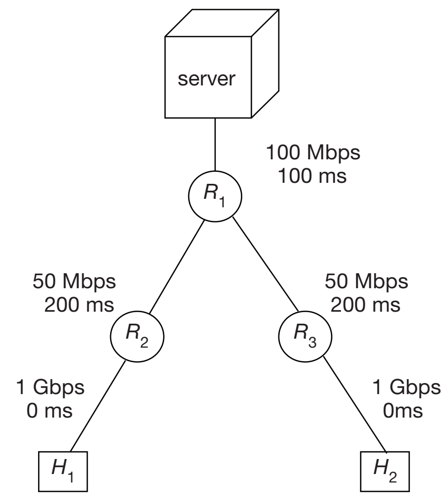
50. Consider the routine fun( ):

```
fun (x, y, k)
{
if (k = = 0)
return x + y;
else if ( y = = 0 && k = = 1)
return 0;
else if ( y = = 0 && k = = 2)
return 1;
else if ( y = = 0)
return x;
else
return fun (x, fun (x, y - 1, k), k
- 1);
}
```

The value returned when fun(2,3,3) called is ______.

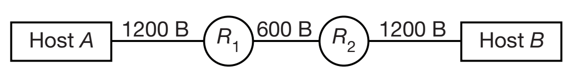
51. Suppose TCP uses Additive Increase Multiplicative Decrease (AIMD) Technique for its congestion control. The congestion window increases by 1MSS every time a batch of ACKs is received. Assume that the round-trip times are constant. If the initial window size is 5MSS, then the average throughput (in terms of MSS per RTT) for this TCP connection upto time 6RTT (MSS/RTT) is ______.

52. Consider below figure; in which a server is connected to a router, R_1 by a 100 Mbps link with a propagation delay of 100 ms. R_1 is connected to two routers R_2 and R_3 each over a 50 Mbps link with a propagation delay of 200 ms. The Routers R_2 and R_3 are connected to two hosts each with a 1 Gbps link and with no propagation delay.



All the packets in the network have 20,000 bits. If there are no caches, no queueing delays at the routers and if the packet processing delays at the routers and nodes are all zero then the end-to-end delay required by a client to receive a packet from server (in msec) is ______.

53. Consider below network:



Two Hosts A and B have a separate shared Ethernet with a Maximum Transfer rate (MTU) of 1200 Bytes. The two Hosts are connected with a point-to-point link, which has a MTU of 600 Bytes. The MTU includes TCP, IP headers and data.

If Host A passes 2000 Bytes to TCP of Host B. Then the number of bits delivered to network layer in Host B (in Bytes) is ______.

54. Consider the below languages which are defined over $\Sigma = \{0, 1\}$:

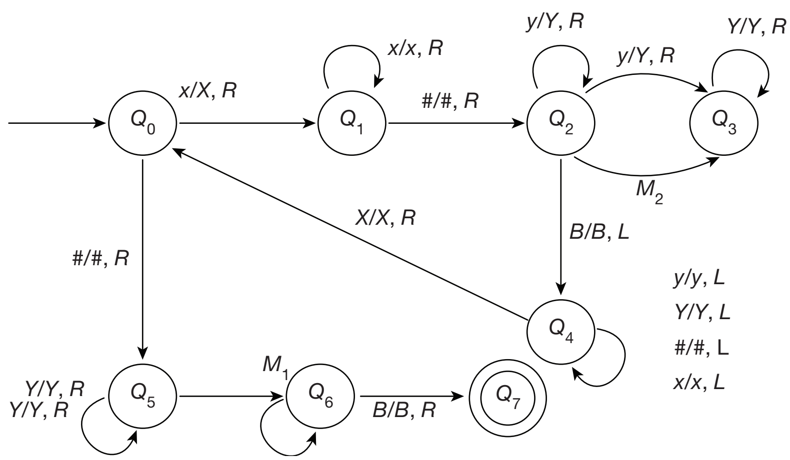
$L_1 = \{w/w$ contains an even number of 0's and an odd number of 1's$\}$

$L_2 = \{w/n_1(w) = k * n_0(w)$ for some $k \in N\}$

$L_3 = \{w/ \text{ I } n_0(w) - n_1(w) \text{ I mod } 3 = 0\}$
$L_4 = \{w/ \text{ I } n_0(w) - n_1(w) \text{ I mod } 3 = 1\}$
(here $n_0(w)$ is number of 0's in w, $n_1(w)$ is number of 1's in w)
Which of these languages are regular?
(A) I, III only (B) I, III, IV only
(C) I, II, IV only (D) I, II, III, IV

55. Consider a push down automata with the following instantaneous description:
$\delta(q_0, a, \in) = \{[q_0, A]\}$
$\delta(q_0, a, A) = \{[q, AA]\}$
$\delta(q_0, \in, \in) = \{[q_1, \in]\}$
$\delta(q_0, b, A) = \{[q_2, \in]\}$
$\delta(q_1, \in, A) = \{[q_1, \in]\}$
$\delta(q_2, b, A) = \{[q_2, \in]\}$
$\delta(q_2, \in, A) = \{[q_2, \in]\}$
Here q_0 is the initial state. Initially stack has empty symbol, $\in$.
Both states q_1, q_2, reach a final state with no input left and empty stack.
The stack symbol is $\{A\}$.
Input alphabet is $\{a, b\}$. Each δ transition has the form δ(current state, input, top of stack)
= {[Resultant state, X]}
X can be either the symbol which is written in-place of top of stack (if X is $\in$) or new item placed on top of stack.
What is the language accepted by the given PDA?
(A) $\{a^i\, b^j \text{ I } i! = j\}$
(B) $\{a^i\, b^j \text{ I } 0 \le i \le j \text{ or } 0 \le j \le i\}$
(C) $\{a^i\, b^j \text{ I } 0 \le i \le j\}$
(D) $\{a^i\, b^j \text{ I } 0 \le j \le i\}$

56. Consider the below Turing machine, M.



M is accepting the language $\{x^n\# \ y^{2^n} \text{ I } n \ge 0\}$
X, Y are symbols written in-place of x and y respectively. each transition has a form (a/b, D), where a is symbol read, b is symbol to be written and D is direction of head movement. Analyze the Turing machine and choose the missing transitions M_1 and M_2 for the correct functioning of M:
(A) $M_1 : y/y, L\ M_2 : y/y, L$
(B) $M_1 : y/y, R\ M_2 : y/y, R$
(C) $M_1 : y/y, L\ M_2 : y/y, R$
(D) $M_1 : y/Y, R\ M_2 : y/Y, L$

57. To increase the efficiency in program controlled I/O technique, the I/O software is written in such a way that the processor periodically checks the status of the device. If the device is not ready, the processor can jump to other tasks. After some time interval, the processor comes back to check status again.
Consider a device, keyboard with a single character buffer. On an average, characters are entered at a rate of 5 characters per second. The time interval between two consecutive key depressions can be 50 ms. Then at what frequency does the processor scans the keyboard?
(A) 200 ms (B) 150 ms
(C) 50 ms (D) Data insufficient

58. A 20 MHz processor has a cache which takes two clock cycles. Data access from main memory over the bus to the processor takes three clock cycles, with no wait states. The data is delivered to the processor in parallel with delivery to cache. If the cache has a hit ratio of 0.9 then the effective duration of memory access (in nano seconds) is ________

59. Consider the Relation R with attributes, Teacher, Course, Textbook, Project, Location, Hours .
For every course, Textbook there is only one Teacher.

For every Location, Hours, Teacher there is only one Course. There is only one Project for any Location and Hours.

P. Course, Textbook → Teacher
Q. Location, Hours, Teacher → Course
R. Project → Location, Hours, Teacher
S. Course → Location , Hours
W. Teacher → Course, Textbook

Which of the following functional dependencies can be inferred from the given statements?

(A) P, Q, R only (B) R, S only
(C) R, S, W only (D) P, R, S only

60. Given an undirected weighted graph $G = (V, E)$ with non-negative edge weights, we can compute a minimum cost spanning Tree $T = (V, E')$. We can also compute, for a given source vertex $S \in V$, the shortest paths from S to every other vertex in V. we now increase the weight of every edge in the graph by 1.

I. All the shortest paths from S to other vertices are unchanged.
II. T is still a minimum cost spanning Tree.

Which of the following is TRUE?

(A) I only (B) II only
(C) Both I and II (D) None of the above

61. Consider the following 2 transactions T_1 and T_2.

T_1:

$x = x - 50$
$y = y + 50$

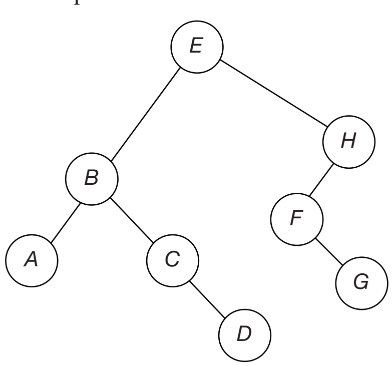
T_2:

$a = a + x$
$a = a + y$

Suppose we start with initial values of 100 for x, 200 for y, and 0 for a, and then T_1 and T_2 run concurrently, that is, at each step we either execute one statement from T_1 or one statement from T_2. Which of the following is not a possible final value of a?

(A) 200 (B) 250
(C) 300 (D) 350

62. In a binary search tree given below, finding node E required one comparison and finding node D requires four comparisons. What is the expected number of comparisons requires to find a node chosen at random?



(A) 3
(B) 2.25
(C) 3.25
(D) 2.75

63. Insert the characters of the string "s, m, o, w, g, v, e, k, y" into a Hash table of size 10. Hash function is $H(X)$ = (ASCII(X) − ASCII (C) + 1) mod 10

Hashing technique is Linear probing, while Hashing which characters, collision occurs?

(A) e, y, v
(B) w, e, k
(C) o, w, e
(D) w, e, y

64. Consider the following 2 tables.

R

X	Y
11	A
12	B
13	C

S

X	Y
11	A
12	B
16	D

The result of $R \cap S$, can be obtained by using which of the following operations (Rational algebra expression should contain same operator any number of times)?

(A) ∪ (union)
(B) − (set difference)
(C) ⋈ (natural JOIN)
(D) None of the above

65. Consider the following sequence of elements

I.	1	2	3	4	5	6	7	8
II.	1	8	2	6	3	7	4	5
III.	5	4	7	3	1	8	2	6

Assume that the last element of the set is used as pivot element in quick sort, to sort the given elements. Which sequence takes maximum time.

(A) I Only
(B) I and II
(C) I and III
(D) I, II and III

Answer Keys

Hints and Explanations

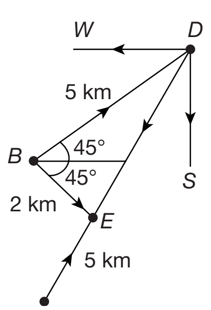
1. Choice (B) is correct. A footpath runs along the road on either side. Similarly, a riverbank runs along the river on either side. Choice (B)

2. I. 2/5th of the weight of a single disc is 13 kg. But we don't know if each disc has the same weight or not. I alone is not sufficient.
We do not know the weight of each disc.
∴ We cannot find the total weight of 25 discs.
II alone is not sufficient
I, II we still cannot answer the question.
Choice (D)

3. Let $f(x) = ax + b$ where a and b are constants.
$f(-4) = 50$ and $f(7) = 6$
$-4a + b = 50$ …… (1)
$7a + b = 6$ …… (2)
$-11a = 44$
$a = -4$
Substituting in (1), we get
$16 + b = 50 \Rightarrow b = 34$
∴ $f(x) = -4x + 34$.
When $x = 8$
$f(x) = -4(8) + 34 = -32 + 34 = 2$
∴ $f(8) = 2$. Ans: 2

4. The right choice is "to call a spade a spade" which means to speak very frankly and openly. None of the other options go as they are negative in connotation. "To see red" is to be afraid, "to throw in the towel" is to accept defeat and "to let the grass grow under one's feet" is to idle too long without any work. Choice (D)

5.



$\angle B = 90°$

$DE = \sqrt{DB^2 + BE^2}$

$= \sqrt{5^2 + 2^2}$ km $= \sqrt{29}$ km ≈ 5.39 km. Choice (D)

6. "Nature" is not preceded by "the" so choices (A) and (D) are ruled out. In (B) the tense is incorrect for a completed action. Choice (C) uses the simple past tense for a completed action and it is correct. Choice (C)

7. All the statements except (D) can be proved false by the passage itself. (A) is not what General Dyer was. Statement (B) too is a distortion of what is stated in the passage. The passage does not state that the victims got a fair trial. In fact, the trial was a travesty of justice and the public supported general Dyer's actions. Statement (C) is out of the scope of the text. Statement (D) is correct as understood from the first two lines of the passage. General Dyer was not a frightened person misbehaving so his actions can neither be understood nor excused. Choice (D)

8. Freon damages ozone layer. A need is felt to substitute Freon with some other coolant. This means that damage to ozone layer is harmful. Hence (D) is the correct answer.
As the cost is not the focus of the argument, (A) is wrong. (B) and (C) cannot be inferred. Choice (D)

9. Choice (B) is apt. The para, when rearranged, is the story of human life, metaphorically presented. 1 mentions two birds. In 3 both are described as "one" eating and the other not eating. 5 follows next as it tells as to what is being eaten, and more importantly, where it is sitting. 4 is a continuation of 5 as it tells the position of the other bird. So 5 and 4 is a definite pair. 2 is then concluding the analogy. 6 explains why it is the story of the human soul. Choice (B)

10. Area of triangle ABC = Area of ABD + Area of ADC
$\frac{1}{2}(AB)(AC)\sin\angle A = \frac{1}{2}(AB)(AD)\sin\angle BAD + \frac{1}{2}$
$(AD)(AC)\sin\angle DAC = (AB)(AC)\sin 120°$
$= (AB)(AD)\sin 60° + (AD)(AC)\sin 60°$

$$AD = \frac{(AB)(AC)\sin 120°}{AB\sin 60° + AC\sin 60°}$$

$= \dfrac{(AB)(AC)}{AB + AC} = \dfrac{60}{11} = 5.45$ cm. Choice (B)

11. Total number of ways of distributing 10 apples among three persons Mahesh, Naresh and Ramesh $= 3^{10}$
Mahesh and Naresh together has to get exactly 7 apples

$\Rightarrow$ Mahesh and Naresh together gets 7 apples and Ramesh gets 3 apples
The number of ways of selecting 7 apples from 10 to distribute to Mahesh and Naresh $= {}^{10}C_7$
The number of ways of distributing these 7 apples to Mahesh and Naresh $= 2^7$

$\therefore$ The total number of ways of distributing 10 apples among the three persons such that Mahesh and Naresh together get 7 apples $= {}^{10}C_7 \times 2^7$

$\therefore$ Required probability $= \dfrac{{}^{10}C_7 \times 2^7}{3^{10}} = \dfrac{\dfrac{10!}{3! \times 7!} \times 2!}{3^{10}}$

$= 15 \times \left(\dfrac{2}{3}\right)^{10}$ Choice (B)

12. The statement formulas given in options (A), (B) and (D) are all equivalent to p.
The statement formula given in option (C),
i.e., $p \wedge F_o \Leftrightarrow F_o$ = contradiction
and NOT equivalent to p. Choice (C)

13. We have $\displaystyle\int_1^5 \frac{\sqrt{x+5}}{\sqrt{x+5} + \sqrt{11-x}}\,dx$

$= \displaystyle\int_1^5 \frac{\sqrt{x+5}}{\sqrt{x+5} + \sqrt{(1+5-x)+5}}\,dx = \frac{5-1}{2}$

$(\because \displaystyle\int_a^b \frac{f(x)}{f(x) + f(a+b-x)}\,dx = \frac{b-a}{2}$ and here

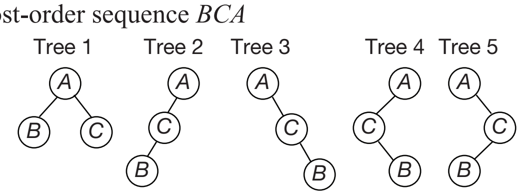
$f(x) = \sqrt{5+x};\ a = 1$ and $b = 5) = 2$ Ans: 2

14. We know that every lattice need not satisfy distributive laws. So, the relation given in option (D) need not be true. Choice (D)

15. The number of different choices available for Rakesh to buy a Zigma $= 3 \times 6 \times 4 \times 2 = 144$
The number of different choices available for Rakesh to buy a Harze $= 4 \times 5 \times 3 \times 2 = 120$

$\therefore$ The total number of different choices available for Rakesh to buy either a Zigma or a Harze $= 144 + 120 = 264$. Ans: 264

16. Post-order sequence *BCA*



All the five trees gives post order sequence *BCA*.
Choice (D)

17. $T(n) = 3T\left(\dfrac{n}{4}\right) + n$

$T(n) = aT\left(\dfrac{n}{b}\right) + f(n)$

$a = 3, b = 4, f(n) = n$

compare $f(n)$ Vs $n^{\log_b^a}$

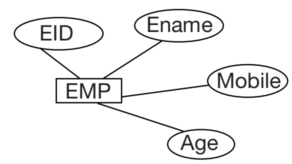
n Vs $n^{\log_4^3}$

n Vs $n^{0.792}$

$f(n) > n^{\log_b^a}$

Case 1 of master theorem
Time complexity $T(n) = \theta(f(n))) = \theta(n)$ Choice (A)

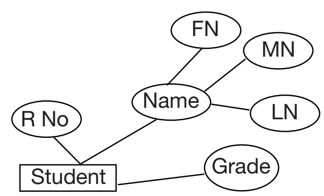
18. Example:



Mobile is a multi valued attribute, so keep mobile attribute in a separate relation (This is defined in 1*NF*)

EId	**Ename**	**Age**

EId	**Mobile**



Name $\rightarrow$ is a composite attribute
FN, *MN*, *LN* $\rightarrow$ are simple component attributes
In the relation only simple component attributes will appear (This is defined by 1NF)
Student

RNo	**FN**	**MN**	**LN**	**Grade**

Choice (C)

19. The value of item A that is read by T_2 is called dirty data because it has been created by a transaction that has not completed and committed yet, hence this problem is also known as the "dirty read problem".
Choice (B)

20. One track contains 20 blocks, means the same track also contains 20 inter block gaps.
Capacity of one track = 20 * 512 + 20 * 64
= 10240 + 1280 = 11520 byes Choice (C)

21. Main memory has n - bit address.

Tag	Set	Block

$\longleftarrow$ *n*-bits $\longrightarrow$

Block size = b bytes

$\Rightarrow$ Bits required for block offset = log b

The cache is m-way set associative.

Number of blocks = s

$\Rightarrow$ number of sets $= \dfrac{s}{m}$

Bits required for set field = log (s/m)

$\therefore$ Tag = n − log (s/m) – log b Choice (D)

22. Number of cycles required using 16-bit processor (for 100 instructions) = (2 * 20) + 1 * 50 + 1 * 30 = 120

Number of cycles required on 32-bit processor for 100 instructions = 100

$\therefore$ Percentage of improvement $= \dfrac{20}{120} * 100$

= 16.67% Ans:16.67

23. The words are defined over $\{a, b, c\}$ such that number of b's is not divisible by 3 or 5 and no 'c' appears after 'a'.

This can be written as

$(L_1 \cup L_2)L_3$ where

L_1 = { number of b's is not divisible by 3}

L_2 = { number of b's is not divisible by 5}

L_3 = { no 'c' appears after 'a'}

L_1, L_2 & L_3 are regular and regular languages are closed under union & concatenation.

$\therefore$ Given language is regular. Choice (A)

24. **Statement I:**

$L_2 = \{w/w \in \{a, b\}^*\}$

$L_1 = \{a^n b^n \text{ I } n \geq 0\}$

L_2 is regular but L_1 is not regular.

$\therefore$ I is not always true.

Statement II:

$L_1 = \phi$

$L_2 = \{a^n b^n \text{ I } n \geq 0\}$

L_1 is regular but L_2 is not regular.

Statement III is also not true always. Choice (D)

25. CRC generator has 11-bits, so the remainder cannot be more than 10.

$\therefore$ Maximum 10-bits present in resulting frame check sequence. Ans: 10

26. 1-way propagation time $= \dfrac{\text{distance}}{\text{speed}}$

$$= \frac{1000 \text{ m}}{2 \times 10^8 \text{ m/s}} = 0.5 \times 10^{-5} \text{ sec}$$

Minimum packet size required is = 2 * propagation time * Bandwidth

$= 2 * 0.5 \times 10^{-5} * 100 \times 10^6$

= 1000 bits. Ans: 1000

27. Choice (C)

28. Let 'V' be the set of vertices. A path between x to y through z is formed by a subset V' of V I $\{x, y, z\}$ and forming a permutation of $V' \cup \{z\}$ for each $i \leq 5$, there are $\binom{5}{i}$ subsets V' of size i, and $(i + 1)!$ permutations of $V' \cup \{z\}$

Thus the number of required paths is

$$\binom{5}{0}1! + \binom{5}{1}2! + \binom{5}{2}3! + \binom{5}{3}4! + \binom{5}{4}5! + \binom{5}{5}6!$$

= 1631

Ans: 1631

29. The address of $A[8][3]$ is $= B + \dfrac{i(i-1)}{2} + j - 1$

$$= 1000 + \frac{8 \times 7}{2} + 3 - 1 = 1030$$

Ans: 1030

30. Total virtual memory required = 16×1024

$= 2^4 \times 2^{10} = 2^{14}$

$\therefore$ 14 bits for logical address.

Choice (C)

31.

1, 3, 5, 6, 3, 1, 3, 5

~~1~~ ~~6~~ 5
3
~~5~~ 1

= 3 page faults

Ans: 4

32.

$$\text{B1}\begin{cases}(1) x = 1 \rightarrow \text{leader} \\ (2) y = 1\end{cases}$$

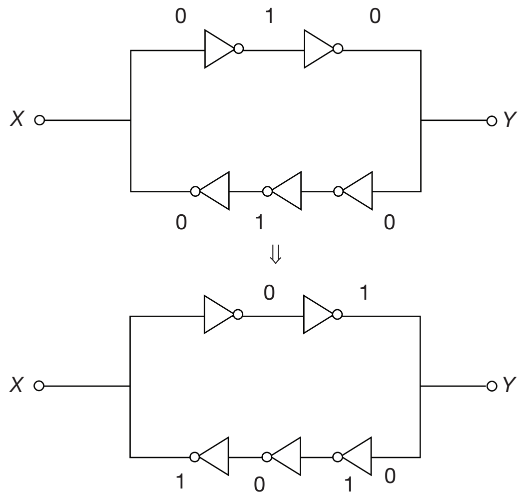
B2 {(3) if $x > i$ goto (9) $\rightarrow$ leader

$$\text{B3}\begin{cases}(4) y = y * x \\ (5) y = 10 \\ (6) t = y * x \\ (7) x = t \\ (8) \text{ goto } (3)\end{cases}$$

B4 {(9) END $\rightarrow$ leader

33. Choice (D)

34.



Choice (D)

35. Memory is specified as $(2^{Addr} \times \text{data})$ bits

So $2^{16} \times 8$ bits = 5, 24, 288 bits   Choice (C)

36. Given $P = \begin{bmatrix} 2 & 131 & -243 & 566 \\ 0 & -2i & 174 & -237 \\ 0 & 0 & 2i & 0 \\ 0 & 0 & -713 & -2 \end{bmatrix}$

The characteristic equation of P is $|P - \lambda I| = 0$

$\Rightarrow \begin{bmatrix} 2-\lambda & 131 & -243 & 566 \\ 0 & -2i-\lambda & 174 & -237 \\ 0 & 0 & 2i-\lambda & 0 \\ 0 & 0 & -713 & -2-\lambda \end{bmatrix} = 0$

$\Rightarrow (2-\lambda)(-2i-\lambda)(2i-\lambda)(-2-\lambda) = 0$

$\Rightarrow (2-\lambda)(2+\lambda)(2i+\lambda)(2i-\lambda) = 0$

$\Rightarrow (4-\lambda^2)(-4-\lambda^2) = 0$

$\Rightarrow -(4-\lambda^2)(4+\lambda^2) = 0$

$\Rightarrow 16-\lambda^4 = 0$

$\Rightarrow \lambda^4 - 16 = 0$

$\therefore$ The characteristic equation of P is $\lambda^4 - 16 = 0$

Hence by Cayley-Hamilton theorem, we have

$P^4 - 16I_4 = 0$ $\rightarrow (1)$

Where I_4 = Identity matrix of order 4.

Multiplying (1) on both sides with P^{-1}, we have

$P^{-1}(P^4 - 16\,I_4) = P^{-1} \times 0$

$\Rightarrow P^3 - 16\,P^{-1} = 0$

$\Rightarrow 16P^{-1} = P^3$ Choice (C)

37. Let A and B denote the events of a randomly selected employee having a Two Wheeler (TW) and a Four Wheeler (FW) respectively.

$\therefore \quad P(A \cup B) = \frac{7}{10}, P(A \cap B) = \frac{2}{5}$ and $P(A/B) = \frac{2}{3}$

We know that $P(A/B) = \dfrac{P(A \cap B)}{P(B)}$

$\Rightarrow P(B) = \dfrac{P(A \cap B)}{P\left(\frac{A}{B}\right)} = \dfrac{\frac{2}{5}}{\frac{2}{3}}$

$\Rightarrow P(B) = \dfrac{3}{5}$

We know that $P(A \cup B) = P(A) + P(B) - P(A \cap B)$

$\Rightarrow \frac{7}{10} = P(A) + \frac{3}{5} - \frac{2}{5}$

$\Rightarrow P(A) = \frac{7}{10} - \frac{3}{5} + \frac{2}{5}$

$\Rightarrow P(A) = \frac{1}{2}$

Hence probability that a randomly selected employee has two wheeler (TW) $= \frac{1}{2}$.   Choice (B)

38. Let H, P and G denote the sets of students, who can speak Hindi, Punjabi and Gujarati respectively.

$\therefore$ $n(H) = 120$, $n(H \cap P) = 35$ and

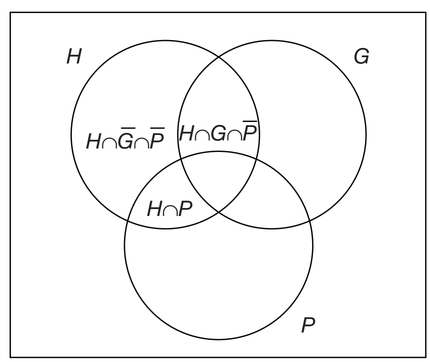
$n(H \cap G \cap \bar{P}) = 40$

We know that $n(H) = n(H \cap \bar{G} \cap \bar{P}) + n(H \cap P) + n(H \cap G \cap \bar{P})$

$\Rightarrow 120 = n(H \cap \bar{G} \cap \bar{P}) + 35 + 40$

$\Rightarrow n(H \cap \bar{G} \cap \bar{P}) = 45$

$\therefore$ The number of students who can speak only Hindi $= n(H \cap \bar{G} \cap \bar{P}) = 45$.



Choice (A)

39. In the given graph G, one can observe that the vertex set $\{a, b, c, d, e, f, g\}$ can be partitioned into two sets $M = \{a, b, c\}$ and $N = \{d, e, f, g\}$ such that any edge in G is between a vertex in M and a vertex in N.

Hence G is a bipartite graph (in fact, a complete bipartite graph).

$\therefore$ The chromatic number of $G = X(G) = 2$ Ans: 2

40. Statement P is nothing but the intermediate value theorem and hence is TRUE.

Counter Example for statement Q:

$$\text{Let } f(x) = \begin{cases} x; & \text{if } 0 \le x < 1 \\ x - 1; & \text{if } 1 \le x \le 3 \end{cases}$$

Then, $f(x)$ assumes every value between $f(0)$ (=0) and $f(3)$ (=2). But $f(x)$ is not continuous at $x = 1 \in [0, 3]$

$\therefore$ Statement Q is not TRUE. Choice (A)

41. From the given circuit $Z = DE + F$

We need expression of Z in terms of A, B, C

ABC = 101, 001 combinations do not occur.

A	B	C	D	E	F	Z = DE + F
0	0	0	0	0	1	1
0	0	1	1	0	0	X
0	1	0	1	1	0	1
0	1	1	1	1	1	1
1	0	0	0	0	0	0
1	0	1	1	0	1	X
1	1	0	0	1	1	1
1	1	1	0	1	0	0

$Z(A, B, C) = \Sigma\, m(0, 2, 3, 6) + \phi(1, 5)$

A \ BC	00	01	11	10
0	1	X	1	1
1		X		1

$Z = \bar{A} + B\bar{C}$ Choice (C)

42. The output of Decoder are active low outputs so

$f(p, q, r) = \overline{\bar{Y}_1, \bar{Y}_2, \bar{Y}_3, \bar{Y}_5} = Y_1 + Y_2 + Y_3 + Y_5$

$= \Sigma m(1, 2, 3, 5)$

p \ qr				
0		1	1	1
1		1		

$= p^1q + q^1r$ Choice (D)

43. Grammars $G1$, $G2$, $G3$ are unambiguous, while $G4$ and $G5$ are ambiguous. Choice (A)

44. The grammer is $LR(1)$. Choice (C)

45. At A we need to place $P(M1)$ to not have Deadlock, at B and C we can place either $P(M2)$ or $P(M3)$ which can be done in 2! ways. Ans: 2

46. The larger possible file will have $32 = 2^5$ indirect blocks. Since each indirect block can point to $512 = 2^9$ blocks the largest file has $512 * 32 = 2^{9+5}$ blocks. Given block size = 1024 bytes = 2^{10} B

The maximum file size is 2^{9+5+10} B

$= 2^{24}$ B = 16 MB Ans: 16

47. RR (T. S. = 3 units):

P_1	P_2	P_1	P_3	P_4	P_2	P_1	P_3	
0	3	6	9	12	14	17	19	20

Ready Queue: $\cancel{P_1} < \cancel{P_2}, \cancel{P_1}, \cancel{P_3}, \cancel{P_4}, \cancel{P_2}, \cancel{P_1}, P_3$

$$\text{Average Turnaround Time} = \frac{19 + 15 + 16 + 8}{4} = 14.5$$

P-SJF:

P_1	P_1	P_1	P_1	P_4	P_3	P_2	
0	2	4	6	8	10	14	20

$$\text{Average Turnaround Time} = \frac{8 + 18 + 10 + 4}{4} = 10$$

HRRN:

P_1	P_2	P_4	P_3	
0	8	14	16	20

At $t = 8$

Response Ratio of process P_2

$$(RR_2) = \frac{6 + 6}{6} = 2$$

$$RR_3 = \frac{4 + 4}{4} = 2$$

$$RR_4 = \frac{2 + 2}{2} = 2$$

At $t = 14$

$$RR_3 = \frac{10 + 4}{4} = 3.5$$

$$RR_4 = \frac{8 + 2}{2} = 5$$

$$\text{Avg. TAT} = \frac{8 + 12 + 10 + 16}{4} = 11.5$$

The order is P – SJF, HRRN, RR. Choice (B)

48. The fun ( ) prints the Inorder traversal of the tree. Choice (C)

49. Tree is connected graph. The value of x will be $(2 \times 200 - 2) = 398$ Choice (B)

50. fun $(x, y, 1)$ will evaluate to xy

fun $(x, y, 1) \Rightarrow$ fun $(x$, fun $(x, y - 1, 1), 0)$

$\Rightarrow$ fun $(x, x\,(y - 1), 0)$

$\Rightarrow$ $x + x\,(y - 1)$

$\Rightarrow$ xy

Similarly fun $(x, y, 2)$ will evaluate to x^y

This can be proved by induction

fun $(x, 0, 2) = 1 = x^0$

fun $(x, 1, 2) = x = x^1$

Similarly fun $(x, y - 1, 2) = x^{y-1}$

fun $(2, 3, 3)$ = fun $(2$, fun $(2, 2, 3), 2)$

= fun $(2, 16, 2)$ [$\because$ fun $(2, 2, 3)$ evaluate to 2^4)

$= 2^{16} = 65536$ Ans: 65536

51. In 1st RTT, 5MSS is sent.

In 2nd RTT, 6 MSS is sent.

In 3rd RTT, 7 MSS is sent.

In 4th RTT, 8 MSS is sent.

In 5th RTT, 9 MSS is sent.

In 6th RTT, 10 MSS is sent.

$\therefore$ Average throughput till 6^{th}

$$RTT = \frac{5+6+7+8+9+10}{6} = \frac{45}{6}$$

$= 7.5\ MSS/RTT$. Ans :7.5

52. Packet size = 20000 bits

Time to transmit the packet from sever to R_1 over 100 Mbps link is $\frac{20000}{100 \times 10^6} = 200$ μsec.

Time to transmit the packet from R_2 over 50 Mbps link is $\frac{20000}{50 \times 10^6} = 400$ μsec.

Time to transmit the packet from R_2 to $H1$ over 1 Gbps link is $\frac{20000}{1 \times 10^9} = 20$ μ sec.

$\therefore$ End-to-end delay = sum of propagation delays of the links + sum of link transmission times

= (100 + 200 msec) + (200 + 400 + 20) μsec

= 300 msec + 620 μsec

= 300 msec + 0.620 msec

= 300.62 msec Ans : 300.62

53. The MTU between Host A and R_1 is 1200 Bytes. The data to be transferred is 2000 Bytes. So 2 packets required and each with both TCP & IP headers.

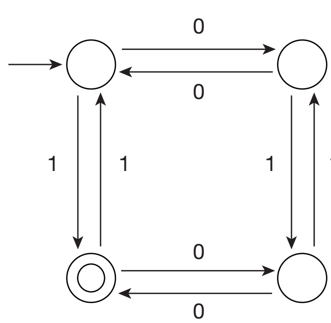
The link R_1 to R_2 has a MTU of 600 B so 1^{st} packet fragmented to 3 packets with separate IP headers.

Also the 2^{nd} packet fragmented to 2 packets with separate IP headers.

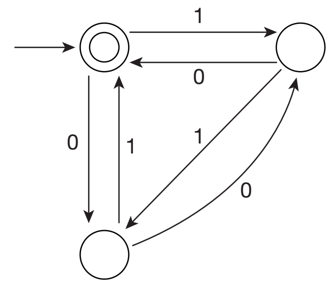
Host B receives 5 packets in which 2 have both TCP & IP headers, 3 have only IP header & 2000 Bytes of data.

$\therefore$ Data received by the Network layer of Host B is $2000 + 5 * 20 + 2 * 20 = 2140$ Bytes. Ans :2140

54. L_1 is regular. The DFA for L_1 is shown below:



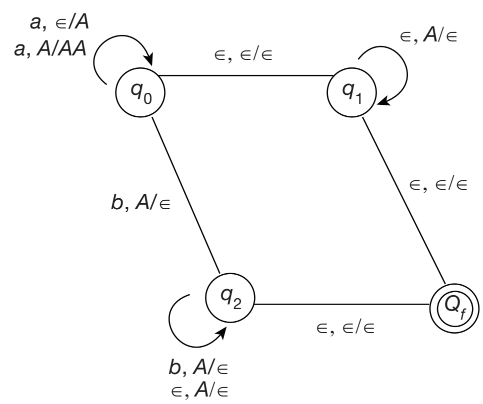
L_2 is not regular. For $k = 1$, we need to construct a DFA which accepts the strings with equal number of 0's and 1's. This is not possible to construct a DFA for this language. L_3 is regular. The DFA for L_3 is shown below.



L_4 is not regular. We can prove this using pumping lemma.

Choice (A)

55. Based on the given description, the PDA will be as below:



State q_0 writes 'A' for each 'a' in input. With no input it goes to q_1 to pop all the pushed A's, and reaches final state.

$q_{1,}$ is used to accept any number of a's.

q_0 goes to q_2 with input b and top of stack A and replaces A with $\in$.

q_2 pops A's for each b. There need to be A's on stack even after processing all b's. With no input it goes to final state.

From this we can observe that the PDA accepts strings of the form, $\{a^i b^j \text{ I } 0 \le j \le i\}$. Choice (D)

56. Given TM, M accepts the language,

$\{x^n \# y^{2^n} \text{ I } n \ge 0\}$

After analyzing the machine we can identify that the logic is to "Replace an 'x' with X and traverse till #. Now replace half of the (remaining) y's with Y". This needs to be repeated till a y is remained in the input and with that accept the string.

Example: for $n = 3$,

$x\,x\,x\,\#\,y\,y\,y\,y\,y\,y\,y\,y\,B$

$\Downarrow$

$X\,x\,x\,\#\,Y\,y\,Y\,y\,Y\,y\,Y\,y$

$\Downarrow$

$X\,X\,x\,\#\,Y\,Y\,Y\,y\,Y\,Y\,Y\,y$

$\Downarrow$

$X\,X\,X\,\#\,Y\,Y\,Y\,Y\,Y\,Y\,Y\,y$

We can replace that left out y with Y and accept the string. (i.e., for each x, strike-off half of y's and for zero x there will be one y).

Hence M_1 is y/y, R

M_2 is y/y, R. Choice (B)

57. The keyboard has single character buffer.

The time interval between two consecutive depressions is 50 ms.

To avoid overwriting of data the processor needs to check the keyboard once every 50 ms. Choice (C)

58. Processor has 20 MHz frequency.

Cycle time $= \dfrac{1}{20\times 10^{6}} = 0.05\times 10^{-6}$ sec.

$= 50 \times 10^{-9}$ sec $= 50n$ sec.

Cache access time = 2 cycles = 2 × 50 = 100n sec.

Main memory access time = 3 cycles = 3 × 50 = 150n sec.

Effective memory access time = 0.9 * 100 + 0.1 * 150

= 90 + 15 = 105n sec. Ans:105

59. Functional dependency $X \rightarrow Y$

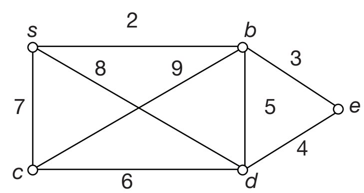
Unique values

R. Project → Location, Hours

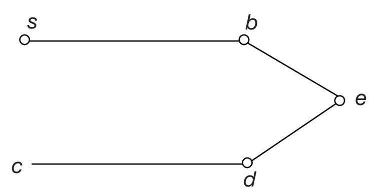
S. Course → Location, Hours, Teacher

W. Teacher → Course, Textbook Choice (C)

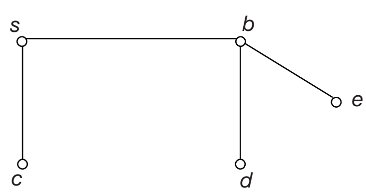
60. Consider the given graph.



Minimum spanning Tree:



Shortest path from s:



Solution set [s]

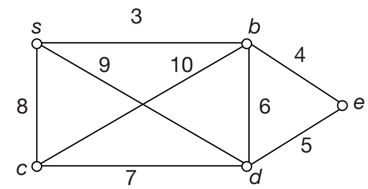
I. Distance [b] = 2
   Distance [c] = 7
   Distance [d] = 8
   Distance [e] = ∞

II. Solution set [sb]
   Distance [c] = min {7, 11} = 7
   Distance [d] = min {8, 7} = 7
   Distance [e] = min {∞, 5} = 5

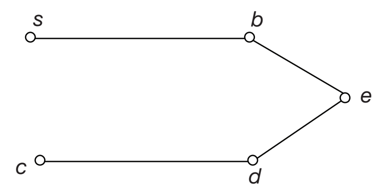
III. Solution set [sbe]
   Distance [c] = min {7, ∞} = 7
   Distance [d] = min {7, 9} = 7

IV. Solution set [$sbec$]
   Distance [d] = min {7, 13} = 7

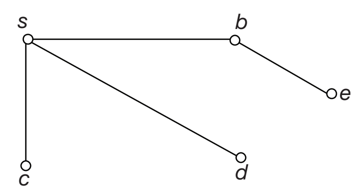
Consider the same graph, with edge weights increased by 1.



Minimum spanning Tree:



Shortest path tree:



Shortest path from node s:

I. Solution set [s]
   Distance [b] = 3
   Distance [c] = 8
   Distance [d] = 9
   Distance [e] = ∞

II. Solution set [sb]
   Distance [c] = min {8, 13} = 8
   Distance [d] = min {9, 9} = 9
   Distance [e] = min {∞, 7} = 7

III. Solution set [sbe]
   Distance [c] = min {8, ∞} = 8

Distance [d] = min {9, 12} = 9

IV. solution set [$sbec$]
   Distance [d] = min {9, 15} = 9

∴ Spanning Tree is same

∴ Shortest path tree may varies. Choice (B)

61. Lets assign a number to statements

	T_1:	T_2:
(1)	$x = x - 50$	$a = a + x$
(2)	$y = y + 50$	$a = a + y$

Sequence 1:
1, 3, 2, 4
$x = 50$
$a = 50$
$y = 250$
$\boxed{a = 300}$
Sequence 2:
3, 1, 2, 4
$a = 100$
$x = 50$
$y = 250$
$\boxed{a = 350}$
Sequence 3:
1, 3, 4, 2
$x = 50$
$a = 50$
$a = 250$
$y = 250$
∴ The value 200 is not possible for 'a'. Choice (A)

62. The number of comparisons required for,
Node $A = 3$
Node $B = 2$
Node $C = 3$
Node $D = 4$
Node $E = 1$
Node $F = 3$
Node $G = 4$
Node $H = 2$
The expected number of comparisons required to find a node at random

$$= \frac{3+2+3+4+1+3+4+2}{\text{Number of nodes}} = \frac{22}{8} = 2.75$$ Choice (D)

63. (1) ASCII (s) = 115
$H(115) = ((115 - 99) + 1) \bmod 10$
$= 17 \bmod 10 = 7$
(2) ASCII (m) = 109
$((109 - 99) + 1) \bmod 10$
11 and 10 = 1
(3) ASCII (o) = 111
$((111 - 99) + 1) \bmod 10$
13 and 10 = 3
(4) ASCII(w) = 119
$((119 - 99) + 1) \bmod 10$
21mod 10 = 1 (collision)
(5) ASCII (g) = 103
$((103 - 99) + 1) \bmod 10$
5 mod 10 = 5
(6) ASCII (v) = 118
$((118 - 99) + 1) \bmod 10$
20 mod 10 = 0
(7) ASCII (e) = 101
$((101 - 99) + 1) \bmod 10$
3 mod 10 = 3 (collision)
(8) ASCII (k) = 107
$((107 - 99) + 1) \bmod 10$
9 mod 10 = 9
(9) ASCII (y) = 121
$((121 - 99) + 1) \bmod 10$
23 mod 10 = 3 (collision)
∴ Collision occurred while hashing 'w', 'e', 'y'
Choice (D)

64. $R \cap S =$

X	Y
11	A
12	B

The same result can be obtained by $R - (R - S)$
$R - S$

X	Y
13	C

$R - (R - S)$

x	y
11	A
12	B
13	C

−

x	Y
13	C

=

x	y
11	A
12	B

Choice (B)

65.
I. 1 2 3 4 5 6 7 8
Quick sort gives worst case Time complexity (maximum time) on a sorted array, that is $O(n^2)$ Time.

II. 1 8 2 6 3 7 4 5 (pivot 5)
Swap

First Iteration: 1 5 2 6 3 7 4 8

1 5 2 4 3 7 6 8

1 3 2 4 $\boxed{5}$ 7 6 8

Second Iteration: 1 3 2 4 $\boxed{5}$ 7 6 8
Pivot = 4 Pivot = 8

1 3 2 $\boxed{4}$ $\boxed{5}$ 7 6 $\boxed{8}$

Third iteration $\boxed{1\ 3\ 2}$ $\boxed{4}$ $\boxed{5}$ $\boxed{7\ 6}$ $\boxed{8}$
Pivot = 2 Pivot = 6

1 5 2 4 3 7 6 8
∴ The time required is $O(n \log n)$
III. first iteration:
5 4 7 3 1 8 2 6 (pivot 6)
5 4 6 3 1 8 2 7

5 4 2 3 1 $\boxed{6}$ 8 7

Second iteration:
5 4 2 3 1 $\boxed{6}$ 8 7

Pivot 1 Pivot 7

1 4 2 3 5 $\boxed{6}$ $\boxed{8}$ $\boxed{7}$

$\boxed{1}$ 4 2 3 5 $\boxed{6}$ $\boxed{7}$ $\boxed{8}$

Third iteration:

4 2 3 5 (pivot 5)

4 2 3

Fourth iteration:

4 2 3 (pivot 3)

3 2 4

2 3 4

∴ The time required is $O(n \text{ long } n)$

∴ I – takes maximum time. Choice (A)

Mock Test 4

Number of Questions: 65 **Total Marks: 100**

Wrong answer for *MCQ will result in negative marks, (–1/3) for 1 Mark Questions and (–2/3) for 2 Marks Question.*

General Aptitude

Number of Questions: 10 **Section Marks: 15**

Directions for question 1: Choose the most appropriate word from the options given below to complete the following sentence.

1. Despite its known toxicity, lead continues to be used, to the great _______ of human and environmental health.
   (A) impediment (B) detriment
   (C) chagrin (D) solace

Directions for questions 2 and 3: Select the correct alternative form the given choices.

2. A 7-year old child assembles an object from lego blocks. The object is in the shape of a cylinder surmounted by a hemisphere of radius 7 cm. If the height of the cylinder is 7 cm, find the volume of the object (in cm^3).
   (A) $\frac{3\pi}{5}(7^2)$ (B) $\frac{5\pi}{3}(7^3)$
   (C) 7^3 (D) $7^3\pi$

3. In a certain code language, if Zoology is called Anthropology, Anthropology is called Ornithology, Ornithology is called Biology, Biology is called Cosmology, Cosmology is called Ecology, Ecology is called Etymology, then what is the study of human called in that language?
   (A) Biology (B) Ecology
   (C) Ornithology (D) Cosmology

Directions for question 4: Select the pair that best expresses a relationship similar to that expressed in the capitalized pair.

4. BIOLOGY: LIFE
   (A) Archaeology: Antiques (B) Astrology: Stars
   (C) Cosmetology: Beauty (D) Mythology: Myths

Directions for question 5: Fill in the blanks from the options given below:

5. _______ summer monsoon _______ been showing a weakening trend _______ the past century with decreasing rainfall over large regions of _______ Indian subcontinent.
   (A) The, has, over, the
   (B) The, has, over, no article
   (C) A, had, across, no article
   (D) The, has, in, the

Directions for questions 6 to 10: Select the correct alternative form the given choices.

6. a, b, c, d are distinct positive integers such that:
   $f(a, b, c, d) = \max(a, b, c, d)$
   $g(a, b, c, d) = \min(a, b, c, d)$
   $h(a, b, c, d)$ = remainder of $(c \times d/a \times b)$
   If $(c \times d) > (a \times b)$
   $h(a, b, c, d)$ = remainder of $(a \times b)/(c \times d)$
   if $(c \times d) < (a \times b)$
   Also, a function $fgh(a, b, c, d) = f(a, b, c, d) \times g(a, b, c, d) \times h(a, b, c, d)$
   the value of fg [h(12, 11, 8, 16), 17, 9, 16] _______

7. Textbooks of medicine say that there is no direct connection between the brain and the lymphatic system, yet a paper published in the journal *Nature* refers to the discovery of exactly such a connection.
   Which one of the statements given below is logically valid and can be inferred from the above sentence.
   (A) A paper published in the journal *Nature* corroborates the fact that there is no direct connection between the brain and the lymphatic system.
   (B) Textbooks of medicine declare that there is no direct connection between the brain and the lymphatic system and this is affirmed by a paper published in the journal *Nature*.
   (C) Texts of medicine proclaim that there is no direct connection between the brain and the lymphatic system but a paper published in the journal *Nature* says that such a connection is indeed there.
   (D) While textbooks of medicine maintain that there is no direct connection between the brain and the lymphatic system, a paper published in the journal *Nature* claims that the brain and the lymphatic system are connected indirectly.

8. The last decade has witnessed a slow but steady realisation within the Indian government that the threats of the future will come from cyberspace. Unfortunately, while the realisation exists, the Indian security establishment has not been jolted into action in the manner in which the Kargil War or the 26/11 terrorist attack on Mumbai galvanised the nation into adopting a series of corrective measures.
   Which of the statement(s) below is/are logically valid and can be inferred from the above passage?
   (i) Although the Indian government realizes that the threats of the future will be from cyberspace, it is yet to accord the seriousness which is due to this threat.
   (ii) Despite the fact that the Indian government realizes that the future threats will come from cyber-

space, it does not consider these threats as devious as other threats which spurred the government to adopt corrective measures.

(iii) The Indian government considers that the threats from cyberspace will not pose a serious threat to the security of the nation.

(iv) The Indian government fails to consider that the threats from cyberspace could pose a threat to the security of a nation.

(A) Only i (B) i and ii
(C) iii and iv (D) i, ii and iii

9. 30 students in class of *BV* School, wrote a test with 4 questions. For each question the number of students who answered correctly, incorrectly and did not attempt are tabulated below. The marks for each question are also listed in the table. There is no negative marking or partial marking.

Q.No.	Marks	Answered correctly	Answered incorrectly	Did not attempt
1	3	15	5	10
2	2	10	7	13
3	2	20	9	1
4	1	11	10	9

If the number of students who attempted all questions is 5, what is the maximum possible number of students who left at least 2 questions unattempted?

(A) 3 (B) 16
(C) 8 (D) None of these

10. The given statement is followed by some courses of action. Assuming the statement to be true, decide which of the given courses of action logically follows for pursuing.

Statement:

There have been steep increases in the government's expenditures on garbage collection, sorting, storage and recycling.

Courses of action:

(i) Government should encourage people to sort their garbage, by providing them separate bins for dry and wet garbage.

(ii) Once garbage is collected from households, to the extent possible it should be directed towards recycling, so that it can cut down on storage costs.

(iii) The routes of the collection vehicles should be planned in such a way that they are used in a most efficient manner.

(A) Only (i) and (ii) follow
(B) Only (ii) and (iii) follow
(C) Only (i) and (iii) follow
(D) All (i), (ii) and (iii) follow

COMPUTER SCIENCE ENGINEERING

Number of Questions: 55 **Section Marks: 85**

Directions for questions 11 to 65: Select the correct alternative from the given choices

11. A letter is selected at random from each of the two words 'FRACTION' and 'DECIMAL'. Probability that the selected letter in a word should NOT be in the other word is ______________

(A) 3/14 (B) 5/14
(C) 7/13 (D) 9/13

12. The value of $\lim_{x \to 3} \log_5[4x^3 + \sqrt{(3x^4 + 5x^2 + 1)}]$ is _______

13. The solution of the recurrence relation $a_n - a_{n-1} = n^2$; $n \geq 1$ with $a_0 = 2$ is ___________

(A) $\dfrac{n^3 + 6n^2 + 2n + 6}{6}$ (B) $\dfrac{2n^3 + 3n^2 + n + 12}{6}$

(C) $\dfrac{n^3 + 3n^2 + 2n + 6}{12}$ (D) $\dfrac{2n^3 + 3n^2 + 4n + 12}{12}$

14. If $S = \{1, \{2, 3\}, 4\}$, then the cardinality of $P(P(A))$ (where $P(S)$ stands for the power set of the set S) is ____________

15. If $P(x)$ and $Q(x, y)$ denote two predicate variables, then which of the following is NOT equivalent to the negation of $(\forall x)\ (P(x) \rightarrow Q(x, y))$?

(A) $\rceil(\forall x)\ (\rceil Q\ (x, y) \rightarrow \rceil P(x))$

(B) $(\exists x)\ \rceil(P(x) \rightarrow Q\ (x, y))$

(C) $(\exists x)\ (P(x) \wedge \rceil Q\ (x, y))$

(D) $(\forall x)\ (P(x) \wedge \rceil Q\ (x, y))$

16. Consider the below C program:

```
int main(void)
{
    int x =1023, c = 0 ;
    while (x ! = 0)
    {
    x = x & (x - 1);
    c = c + 1 ;
    }
    printf ("%d" , c);
}
```

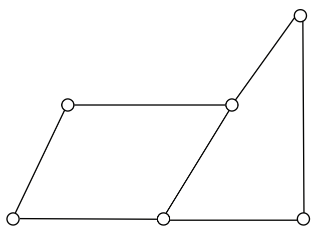
The above program prints _____.

17. Consider the adjacency matrix given below:

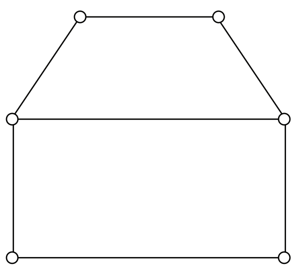
$$\begin{bmatrix} 0 & 1 & 0 & 0 & 0 & 1 \\ 1 & 0 & 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 1 & 0 & 1 \\ 0 & 0 & 1 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 & 0 & 1 \\ 1 & 0 & 1 & 0 & 1 & 0 \end{bmatrix}$$

In Adjacency matrix, rows and columns are indexed by Vertices of graph. Entry is 1 if corresponding vertices are connected by an edge and is 0 otherwise. Which of the following graphs has the above adjacency matrix?

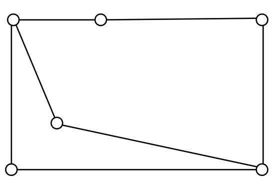
(i)



(ii)



(iii)



(A) (i) & (ii) (B) (i) & (iii)
(C) (ii) & (iii) (D) None of the above

18. An array A[- 32 ... 75] is stored in a memory whose starting address is 209. If each element takes 2 bytes. Then the location of A[50] is ______.

19. A direct access file has fixed size of 10 byte records. The logical location of first byte of record 9 will start at ______.

20. Consider a system with 6 processes ($P_1, P_2, ..., P_6$) with its resource distribution as given below:

Process-id	Allocated resources	Resources needed
P_1	2	2
P_2	3	3
P_3	4	3
P_4	2	2
P_5	2	2
P_6	2	3

The minimum number of processes should be killed to make the above system safe is:

(A) 1 (B) 2
(C) 3 (D) 4

21. Which of the following statement is FALSE?

(A) Every SLR(1) grammar is LALR(1).
(B) Operator precedence parser can parse both ambiguous and unambiguous grammar.
(C) Every operator precedence grammar is LR(0) grammar.
(D) None of the above.

22. Consider below code:

```
i = j = 0;
for (; ;)
{
j++;
if (i > x)
    break;
    i++;
}
```

The value of j, after the loop termination is:

(A) x (B) $x + 1$
(C) $x + 2$
(D) The loop doesnot terminate.

23. Assume that a new memory technology is developed, which is named as NextGenRAM. NextGenRAM is non-volatile. The access latency of NextGenRAM is twice that of an SRAM cell but same as that of a DRAM cell. The read/write capability of NextGenRAM is same as that of a DRAM energy. The cost of NextGenRAM is similar to DRAM, but the density of NextGenRAM is more than DRAM. Also the NextGenRAM cell stops functioning, after 2000 writes are performed to the cell. Then which of the following statement is TRUE?

I. There is an advantage of NextGenRAM over DRAM.
II. There is an advantage of NextGenRAM over SRAM.

(A) I only (B) II only
(C) Both I and II (D) Neither I nor II

24. Which of the following statement is FALSE?

(A) If the pipeline depth increases, then the latency to process a single instruction also increases.
(B) Having a 32-bit wide data bus to memory is a micro-architecture level design choice.
(C) Having a predicted instruction execution is ISA level design choice.
(D) A 2-level global branch prediction is ISA (Instruction set Architecture) level Design choice.

25. Consider the following languages:
$L_1 = \{a^n b^n \mid n \in N, N \text{ is a set of natural numbers}\}$
$L_2 = \{b^n a^n \mid n \in N, N \text{ is a set of natural numbers}\}$
Then the language $L_1 \cap L_2$ is:
(A) Regular (B) non-regular
(C) CFL but not regular (D) not a CFL

26. Consider a set of Turing decidable languages D and a set of Turing recognizable languages R. Then which of the following is always TRUE?
(A) $D \equiv R$ (B) $D \subset R$
(C) $R \subset D$ (D) $D \not\subset R$

27. Which of the following IPv4 address is used by hosts when they are being booted?
(A) 0.0.0.0 (B) 127.0.0.0
(C) 0.0.0.1 (D) 255.255.255.255

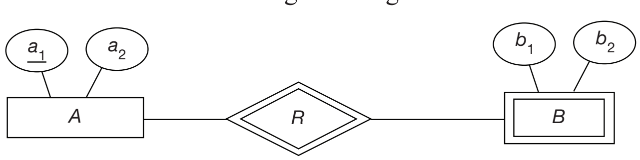
28. Which of the following statement(s) is/are TRUE?
I. A passive hub connects the wires coming from different branches.
II. A repeater can connect two LANs.
III. A Bridge can check the MAC address contained in the frame to forward or drop it.
(A) I, II only (B) II, III only
(C) I, III only (D) I, II, III

29. A Hash table T with 40 slots, stores 5000 elements, what is load factor ($\propto$)?
(A) 250 (B) 125
(C) 500 (D) 400

30. Consider the elements 1, 2, 3, 4, 5, 6, 7 construct a complete binary tree with the given elements in the given sequence. To convert the tree into MAX-HEAP what is the number of swaps required?
(A) 7 (B) 5
(C) 4 (D) 3

31. To calculate the value of a^n, by using Divide - and - conquer. Which of the following Recurrence relation shows the procedure?
(A) $T(n) = T(n-1) + T(1)$
(B) $T(n) = T\left(\frac{n}{2}\right) + T\left(\frac{n}{2}\right) + C$
(C) $T(n) = T\left(\frac{n}{4}\right) + \log n$
(D) $T(n) = T\left(\frac{n}{2}\right) + C$

32. Consider the following ER-Diagram:



For a weak entity set to be meaningful, it must be associated with another entity set, that is called
(A) Neighbor set (B) Strong Entity set
(C) Weak Entity set (D) None of the above

33. What does the following SQL query return?
SELECT *
FROM Student, Department.
(A) It returns the Natural JOIN of student and department.
(B) It returns the CROSS PRODUCT of student and department.
(C) It returns the JOIN of student and department.
(D) It returns the UNION of student and department.

34. Which of the following is/are functionally complete set of Boolean operators?
(A) (NOT, XOR) (B) (AND, OR)
(C) (NOT, OR) (D) All the above

35. Sensors are used to monitor the pressure and the temperature of a chemical solution stored in a boiler. The circuitry for each sensor produces a HIGH voltage (Logic 1) when a specified maximum value is exceeded. An alarm requiring a Low voltage (Logic 0) input must be activated when either the pressure or the temperature is excessive. The circuit for this application uses _______ gate.
(A) NAND (B) NOR
(C) AND (D) XOR

36. The maximum volume of a cylindrical cistern with open top of surface area (Area of bottom and side) 108π square feet is __________
(A) 216π cubic feet (B) 432 cubic feet
(C) 864 cubic feet (D) 1728 cubic feet

37. If the eigenvalues of a 3×3 matrix A are -1, 2 and 5 then the determinant of the inverse of the matrix $A + 2I_3$, where I_3 is the identity matrix of order 3×3 is _____
(A) $\frac{-1}{10}$ (B) $\frac{1}{10}$
(C) $\frac{-1}{28}$ (D) $\frac{1}{28}$

38. In a city, 60% of the youngsters are engineering graduates and 40% of the youngsters are science graduates. Among the engineering graduates, 45% are self employed where as 30% of the science graduates are self employed. If an youngster is selected at random from that city, who is self employed, then the probability that the person is a science graduate is _____________

39. Which of the following statements is TRUE?
(A) The number of functions that can be defined from $A = \{2, 3, 5, 7, 9\}$ to $B = \{6, 4, 5, 3, 1\}$ is zero.
(B) The number of one-one functions that can be defined from $A = \{a, b, c, d, e\}$ to $B = \{3, 5\}$ is 32.
(C) The number of onto functions that can be defined from $A = \{p, q, r\}$ to $B = \{1, 2, 3, 4, 5\}$ is 60.
(D) The number of bijections that can be defined from $A = \{a, b, c, d, e\}$ to $B = \{p, q, r, s, t\}$ is 120.

40. Match each of the graphs given in Group-I with its chromatic number in Group-II

Group-I	**Group-II**
P: A cycle graph of order 5	1. 2
Q: A wheel graph of order 6	2. 3
R: A bipartite graph of order 7	3. 4
S: A tree of order 8	4. 5

(A) P–1, Q–2, R–3, S–4
(B) P–3, Q–1, R–1, S–2
(C) P–2, Q–3, R–1, S–1
(D) P–2, Q–3, R–4, S–1

41. Consider the code segment:
int fun (int x)
{if ($x <= 1$) return 1; $x = (x - 1)(x - 1) - 2 - x * x + 3 * x$;
fun (x); print$f$ (“%d”, x)}
What is the output when fun(6) is called?
(A) 5 5 5 5 5 (B) 1 1 1 1 1
(C) 5 4 3 2 1 (D) 1 2 3 4 5

42. Consider below process table:

Process	Arrival time	Burst time
P_1	1	6
P_2	2	10
P_3	4	14
P_4	8	12

If the Longest remaining time First scheduling (LRTF) algorithm is used then the completion time of process P_3 is ______.

43. Consider a system with physical address “F” bits, logical address “L” bits and the page size “P” Mb. The size of page table (in bits) is ______.
(A) $[F - 20 - \log_2 P][2^{L-(20+\log_2 P)}]$ bits
(B) $[P - 20 - \log_2 F][2^{P-(20+\log_2 F)}]$
(C) $[F - 20 - \log_2 F][2^{P-(20+\log_2 P)}]$
(D) Date Inadequate

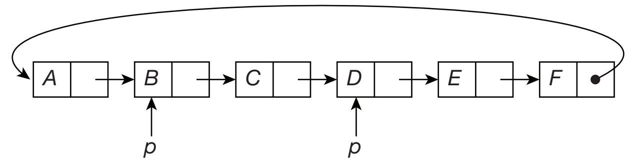
44. Consider a system with five processes P_1, P_2, P_3, P_4, P_5 with resources R_1, R_2, R_3, R_4, R_5:

	Allocated resources $R_1\ R_2\ R_3\ R_4\ R_5$	Maximum resources needed $R_1\ R_2\ R_3\ R_4\ R_5$
P_1	1 0 0 1 2	1 1 1 1 2
P_2	2 1 0 1 1	3 2 1 1 1
P_3	1 2 3 0 1	2 2 3 0 1
P_4	0 1 1 1 0	1 2 2 1 0
P_5	0 0 0 1 0	1 1 1 1 0

Which of the following resources availability makes above system deadlock free?

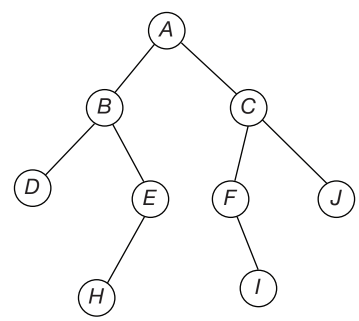
	R_1	R_2	R_3	R_4	R_5
(A)	1	0	0	0	0
(B)	0	0	0	1	0
(C)	0	0	0	0	1
(D)	0	0	1	0	0

45. Consider below linked list:



struct SL
{int data;struct SL *link;} ;
“p” and “q” are pointers pointing to the nodes as shown in above figure. Consider the code snippet:
struct node * temp;
$q = q \rightarrow$ link;
$q \rightarrow$ link $\rightarrow$ link $\rightarrow$ link $= p \rightarrow$ link $\rightarrow$ link;
$p \rightarrow$ link = NULL;
The above code results in:
(A) The list that remains same
(B) deletion of two elements.
(C) deletion of the node to which pointer “p” points.
(D) deletion of the node to which pointer “q” is pointing

46. Consider below binary tree:



```
Consider the routine fun ()
    struct BT
    {
    struct BT *left;
    int data;
    struct BT *right;
    };
struct BT* fun (struct BT * t)
    {
      if (t)
      {
        fun (t → left);
        printf ("%d", t → data);
        fun (t → right);
        printf("%d", t → data);
      }
    }
```

if root node is passed as a parameter to fun ( ), the output is:

(A) $D\,B\,H\,H\,E\,E\,B\,D\,A\,A\,C\,F\,F\,I\,I\,C\,J\,J$
(B) $A\,B\,B\,A\,D\,D\,E\,E\,H\,H\,C\,C\,F\,F\,I\,I\,J\,J$
(C) $D\,D\,B\,H\,H\,E\,E\,B\,A\,F\,I\,I\,F\,C\,J\,J\,C\,A$
(D) $D\,D\,B\,B\,H\,H\,E\,E\,A\,F\,F\,I\,I\,J\,J\,C\,C\,A$

47. Consider the grammar given below:
$A \rightarrow AA + | AA * | a$.
The grammar is:
(A) $LL(1)$
(B) $SLR(1)$ but not $LL(1)$
(C) $LALR(1)$ but not $SLR(1)$
(D) $LR(1)$ but not $LALR(1)$

48. Consider the following SDT:
$X \rightarrow a\,X$ {print "x"}
$X \rightarrow b\,X$ {print "y"}
$X \rightarrow a$ {print "z"}
$X \rightarrow b$ {print "z"}
If the input is $a\,a\,b\,b\,a\,a\,b$ then the output is:
(A) $z\,x\,y\,x\,x\,y\,x$ (B) $x\,y\,x\,y\,x\,x\,z$
(C) x $x\,y\,y\,x\,x\,z$ (D) $z\,x\,x\,y\,y\,x\,x$

49. Consider the following code segment (which is in a high-level language):

```
int a [1000];
int S1 = S2 = S3 = S4 = 0;
for (i = 0; i < 1000; i++)// loop 1
     a[i] = i + 1;
   for (i = 0;i < 1000; i++) //loop 2
   {
   if(i % 4 = = 0) // cond 1
     S1 + = a[i];
   else
     S2 + = a[i];
   if(i % 2 = = 0) // cond 2
     S3 + = a[i];
   else
     S4 + = a[i];
   }
```

What are the branch prediction accuracies of loop 2, cond 1, cond 2 using a 2-bit counter-based prediction scheme (Assume that initially Predictor has False)?
(A) 100%, 75%, 0% (B) 99.7%, 75%, 50%
(C) 99.7%, 25%, 50% (D) 100%, 25%, 0%

50. Consider a processor $P1$. The CPU has a one-level cache. The cache has 128 Bytes with a block size of 32 Bytes. The cache uses LRU replacement policy. The cache is direct mapped cache. A program is executed on this processor. The program tests only the memory read performance by issuing read requests to the cache. Initially the cache is empty. The cache accesses below blocks in the order from left to right.
A, B, A, H, B, G, H, H, A, E, H, D, H, G, C, C, G, C, A, B, H, D, E, C, C, B, A, D, E, F.
Each letter represents a unique cache block.
When the cache accessed for these blocks (as mentioned above), below cache misses occurred.
A, B, A, H, B, G, A, E, D, H, C, G, C, B, D, A, F.
By using this, identify which blocks are competing for same cache block?
I. A and B II. A and E
III. D and H IV. C and F
(A) I, II, III, IV (B) II, IV
(C) I, III (D) I, III, IV

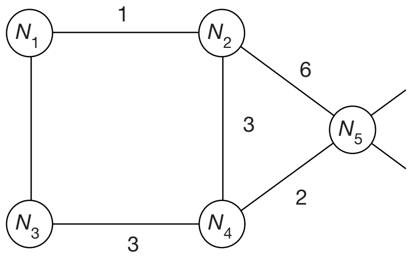
51. Consider below sequence of instructions which are executed on a 5-stage pipeline having the stages:
Instruction Fetch (IF), Instruction Decode and Register Fetch (ID), Execute (EX), Memory access (MA) and Write Back (WB).
ID can happen in First-phase of clock cycle. WB can happen in the second-phase of the clock cycle.
I_1: LOAD R_1, 50(R_6) $R_1 \leftarrow M[50 + R_6]$
I_2: ADD R_2, R_3, R_1 $R_2 \leftarrow R_3 + R_1$
I_3: ADD R_1, R_6, R_4 $R_1 \leftarrow R_6 + R_4$
I_4: STORE R_2, 20(R_4) $M[20 + R_4] \leftarrow R_2$
I_5: AND R_1, R_1 R_4 $R_1 \leftarrow R_1 \wedge R_4$
Each stage requires one clock cycle. If there is no forwarding to hazard detection then the number of stalls that occur during the execution of the program is ________.

52. Which of the following language(s) is/are regular?
L_1 = {ω/ω is the binary representation of a number greater than 3}
L_2 = {ω/ω is some string from L with exactly one character deleted}. (Here L is regular)
$L_3 = \{a^n\, a^n\, a^n \mid n \geq 0\}$
(A) L_1 and L_2 only (B) L_2 and L_3 only
(C) L_1 only (D) L_1, L_2, L_3

53. Consider the following grammar:
$S \rightarrow 0S1 \mid 1X \mid X0$
$X \rightarrow 1X \mid 0X \mid \varepsilon$
Which of the following specifies the language accepted by this grammar?
(A) {ω/ω contains unequal number of 0's and 1's}
(B) {ω/ω contains more number of 1's than 0's}
(C) Complement of the language $\{0^n\, 1^n \mid n \geq 0\}$
(D) {ω/ω contains more number of 0's than 1's}

54. Which of the following language is not context-free but decidable?
I. $\{a^n\, b^m\, a^n\, b^m \mid m, n >= 0\}$
II. {$\omega \in \{a, b\}^*$ | The length of ω is odd and first half contains all a's}
III. {$\omega \in \{a, b\}^*$ | the number of b's in ω is a multiple of the number of a's in ω}
IV. {$\omega \in \{a, b\}^*$ | the number of times 'ab' appears as a substring is equal to the number of times 'ba' appears as a substring}
(A) I, III only (B) II, IV only
(C) I, II, III (D) I, II, III, IV

55. Consider the network shown below:



Assume that each node knows the cost to reach its neighbours. By using Distance-vector algorithm, what could be the forwarding table at node N_5?

(A)

Destination	Next hop
N_1	N_2
N_2	N_2
N_3	N_4
N_4	N_4

(B)

Destination	Next hop
N_1	N_4
N_2	N_2
N_3	N_2
N_4	N_4

(C)

Destination	Next hop
N_1	N_4
N_2	N_4
N_3	N_4
N_4	N_4

(D)

Destination	Next hop
N_1	N_2
N_2	N_4
N_3	N_4
N_4	N_2

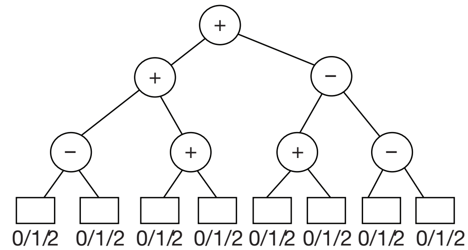
56. Which of the following IP addresses belong to the subnet 137.132.96.0/20?

(i) 137.132.100.0 (ii) 137.132.115.255
(iii) 137.132.102.255 (iv) 137.132.111.0

(A) (i), (ii), (iii), (iv) (B) (i), (iii), (iv)
(C) (iii), (iv) (D) (i), (iii)

57. Consider the Transmission of a 10000 bit frame on 10 Mbps channel with a propagation delay of 250 ms. The sender window size is 7 and probability of error in single frame is 0.001 then the channel utilization for go-back-N protocol (in percentage) is ________ .

58. Consider the given expression tree, Each leaf represents a numerical value, which can be 0 or 1 or 2. What is the maximum possible value of the tree?



(A) 9 (B) 11
(C) 10 (D) 12

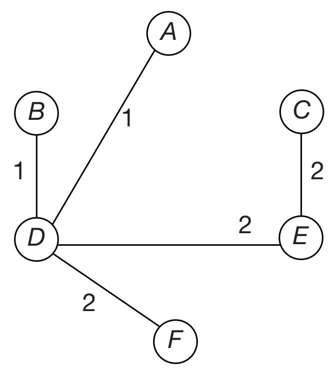
59. Consider the given Recurrence Relation:

$$T(n) = 4T\left(\frac{n}{2}\right) + n^2/\log n$$

What is the time complexity of given recurrence relation?

(A) $\theta(n^2.\log n)$ (B) $\theta(n^3)$
(C) $\theta(n^2.\log.\log n)$ (D) $\theta(n.\log n)$

60. Consider the following weighted undirected graph G,



What is the total weight of minimum spanning tree T, such that the nodes A, B, C must be leaf nodes in the tree T?

(A) 8 (B) 5
(C) 7 (D) 6

61. Consider the following Relation:

Student

RNo	Name

Assume that there are 100 tuples in the student Relation. Both the columns individually contains unique values, then which of the following is correct?

(A) Student Relation is in 1 NF only
(B) Student Relation is in 1 NF, 2 NF only
(C) Student Relation is in 1 NF, 2 NF, 3 NF only
(D) Student Relation is in 1 NF, 2 NF, 3 NF, BCNF

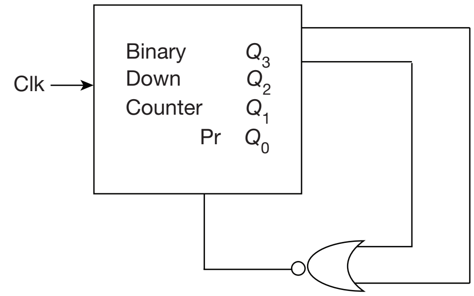
62. In a Relational database there are 3 relations:

Student (Sname)

Department (DName)
Register (Sname, DName)
Which of the following relational algebra expression returns the name of departments that have no students at all?
(A) Department – π_{Dname} (Register)
(B) π_{Dname} Department
(C) Department – π_{Dname} ((Student × Department) – Register)
(D) None of the above

63. Let $f(w, x, y, z) = \Sigma m(0, 2, 5, 6, 7, 8, 9, 10, 11, 13, 15)$. Which of the following expressions are not equivalent to f?
(P) $w^1x^1z^1 + w^1yz^1 + xz + wx^1$
(Q) $x^1z^1 + wz + xz + w^1x$
(R) $wz + xz + x^1z^1 + w^1yz^1$
(S) $x^1z^1 + xz + w^1xy + wx^1$
(A) P and Q (B) R only
(C) Q and S (D) Q only

64. A Binary down sequence, asynchronous counter with synchronous and active high present input is shown in following figure. With the decoding logic shown the counter works as a (consider initially all flip flops at preset state)



(A) Mod - 3 counter (B) Mod - 12 counter
(C) Mod - 13 counter (D) Mod - 14 counter

65. Plain Text: THIS TASK IS IMPOSSIBLE
Key: WANTED
Convert the above plain text to cipher text with key being WANTED, by using Transposition cipher.
(A) IISA SSSB TIIC HKOE AMBD TSPL
(B) AMBD HKOE TIIC IISA SSSB TSPL
(C) HKOE AMBD TIIC IISA SSSB TSPL
(D) TIIC HKOE AMBD IISA SSSB TSPL

Answer Keys

1. B	**2.** B	**3.** C	**4.** D	**5.** A	**6.** 68	**7.** C	**8.** A	**9.** C	**10.** D

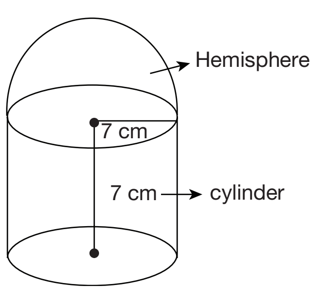
Hints and Explanations

1. 'Toxicity' gives the clue to the correct answer. Something which is toxic is detrimental (harmful). Hence it is logical to say that despite its known 'toxicity', lead continues to be used to the detriment of human and environmental health. The word solace (relief; comfort) runs contrary to what is stated in the sentence. The word chagrin (annoyance) is too mild to be used for something which is toxic. The word impediment (hindrance; obstacle) does not make sense here. Choice (B)

2.



Volume of the hemisphere $= \left(\frac{1}{2}\right)\left(\frac{4}{3}\right)\pi r^3$

$= \left(\frac{2}{3}\right)(\pi)(7^3)$

Volume of the cylinder $= \pi r^2 h = 7^3\pi$

Total volume $= (\pi)7^3\left[1 + \frac{2}{3}\right] = \frac{5\pi}{3}(7^3)$ Choice (B)

3. The study of man is called Anthropology. Form the point, "Anthropology is called ornithology", we can say that Ornithology is the word that is used to refer to Anthropology. Choice (C)

4. Biology is the study of life, Mythology is the study of myths. Archaeology is not the study of antiques, it is the specific study of historic or prehistoric peoples and their cultures by analysis of their artifacts, inscriptions, monuments etc, especially those that have been excavated. Astrology is the study that assumes and attempts

to interpret the influence of heavenly bodies on human affairs. Cosmetology is the art or profession of applying cosmetics. Only option D expresses a relationship which is similar to that expressed by the headwords. Choice (D)

5. The reference is to a specific monsoon hence, the definite article 'the' is more appropriate in the first blank. The present perfect continuous tense 'has been showing' is apt in the second blank because here, the reference is to a trend which started sometime in the past and is still continuing. In the third blank, the reference is to something which took place during a specific time period. This is best denoted using the preposition 'over'. The definite article is required in the fourth blank because the reference is to a particular subcontinent. Choice (A)

6. $h\,(12, 11, 8, 16) = 12 \times 11 > 8 \times 16$
$132 > 128$
Remainder when 132 is divided by 128 = 4.
$fg\,(h(12,11,8,16),17,9,16) = fg\,(4,17,9,16)$
$= f\,(4,17,9,16) \times g\,(4,17,9,16)$
$= 17 \times 4 = 68.$
Ans: 68

7. Options A and B run contrary to what is stated. Option D is incorrect because it is not mentioned that the brain and the lymphatic system are connected 'indirectly'. Only option C can be logically inferred from the given sentence. Choice (C)

8. Only statement (i) can be inferred from the given passage. It cannot be inferred from the passage that the government does not consider cyber threats as serious as other security threats. Options (iii) and (iv) are illogicall. Choice (A)

9. There are 33 instances of students leaving out a question (The sum of the 4 numbers in column 5) Exactly 5 students attempted all 4 questions. We distribute there 33 instances over all the remaining 25 students there would be 8 more instances. We can collect them to at the most 8 students.
∴ The maximum possible number of students who left out at least 2 questions is 8. Choice (C)

10. All I, II and III are appropriate and apt courses of action. Choice (D)

11. The number of ways of selecting one letter each from the words 'FRACTION' and 'DECIMAL' is $8 \times 7 = 56$. The selected letter in a word will not be in the other word only if the common letters are not selected.
The common letters in the two words are *A*, *C* and *I*.
The number of ways of selecting the letters from the words such that the selected letter in a word should not be in the other word = (The number of ways of selecting a letter from *F*, *R*, *T*, *O* and *N*) × (The number of ways of selecting a letter from *D*, *E*, *M* and *L*)
$= 5 \times 4 = 20$
∴ The required probability $= \dfrac{20}{56} = \dfrac{5}{14}$. Choice (B)

12. We have $\lim\limits_{x\to 3} \log_3[4x^3 + \sqrt{(3x^4 + 5x^2 + 1)}]$
$= \log_5\left(\lim\limits_{x\to 3}[4x^3 + \sqrt{(3x^4 + 5x^2 + 1)}]\right)$
$= \log_5(108 + \sqrt{289})$
$= \log_5 125$
$= \log_5 5^3$
$= 3$
Ans: 3

13. Given recurrence relation is:
$a_n - a_{n-1} = n^2;\ n \geq 1 \to (1)$
and $a_0 = 2$
$a_n - a_{n-1} = n^2$
$\Rightarrow\ a_n = a_{n-1} + n^2$
$\therefore\ a_1 = a_0 + 1^2$
$a_2 = a_1 + 2^2 = a_0 + 1^2 + 2^2$
$a_3 = a_2 + 3^2 = a_0 + 1^2 + 2^2 + 3^2$
$a_4 = a_3 + 4^2 = a_0 + 1^2 + 2^2 + 3^2 + 4^2$
$a_n = a_{n-1} + n^2 = a_0 + 1^2 + 2^2 + 3^2 + \ldots + n^2$
$= a_0 + \dfrac{n(n+1)(2n+1)}{6}$
$= 2 + \dfrac{n(2n^2 + 3n + 1)}{6}$
$= \dfrac{2n^3 + 3n^2 + n + 12}{6}$ Choice (B)

14. Given $A = \{1, \{2, 3\}, 4\}$
∴ The cardinality of the set $P(A)$ = Numbers of elements in $P(A) = 2^{n(A)} = 2^3 = 8$
∴ The cardinality of $P(P(A)) = 2^{n(P(A))} = 2^8 = 256$.
Ansr: 256

15. We have negation of $(\forall x)\,(P(x) \to Q(x, y))$
$\Leftrightarrow \rceil[(\forall x)\,(P(x) \to Q(x, y))]$
$\Leftrightarrow \rceil(\forall x)\,(\rceil Q(x, y) \to \rceil P(x))$
$(\because A(x) \to B(x) \Leftrightarrow \rceil B(x) \to \rceil A(x))$
which is same as option (A)
$\Leftrightarrow (\exists x)\,\rceil(\rceil(\rceil Q\,(x, y)) \vee \rceil P(x))$
$(\because \rceil(\forall x)\,A(x) \Leftrightarrow (\exists x)\,\rceil A\,(x)$
and $A(x) \to B(x) \Leftrightarrow \rceil A\,(x) \vee B(x))$
$\Leftrightarrow (\exists x)\,(\rceil Q(x, y)\,\rceil P(x))$
$(\because \rceil(\rceil A\,(x)) \Leftrightarrow A(x)$ and $\rceil(A\,(x) \vee B(x))$
$\Leftrightarrow (\rceil A\,(x) \wedge \rceil B(x)))$
$\Leftrightarrow (\exists x)\,(P(x) \wedge \rceil Q\,(x, y))$
$(\because A(x) \wedge B(x) \Leftrightarrow B(x) \wedge A\,(x))$
which is same as option (C)
Also, consider $\rceil((\forall x)\,(P(x) \to Q(x, y)))$
$\Leftrightarrow (\exists x)\,\rceil(P(x) \to Q(x, y))$
Which is same as option (B)
And the predicate formula given in option (D) is NOT equivalent to the negation of $(\forall x)\,(P(x) \to Q(x, y))$
Choice (D)

16. Given program prints number of 1's in the binary representation of given number (i.e., '*x*'). As x =1023 it prints 10. Ans: 10

17. Choice (A)

18. Address (A[5]) = 209 + (50 − (−32) × 2
= 209 + (82) × 2
= 373

Ans: 373

19. Record 9 will start at byte
((9−1) × 10) + 1
= 80 + 1 = 81

Ans: 81

20. Kill any 1 process to make the system safe.

Choice (A)

21. Choice (C)

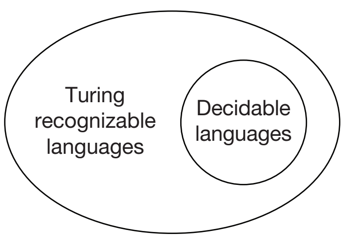
22. Choice (C)

23. The developed NextGenRAM has an advantage over DRAM, as it is non-volatile.
Also NextGenRAM has an advantage over SRAM, as it has lower cost than SRAM. Choice (C)

24. A 2-level global branch prediction is micro-architecture level Design choice. Choice (D)

25. Given, $L_1 = \{a^n\, b^n \mid n \in N\}$
$L_2 = \{b^n\, a^n \mid n \in N\}$
$\Rightarrow \quad L_1 \cap L_2 = \varnothing$
and $\varnothing$ is regular so $L_1 \cap L_2$ is regular. Choice (A)

26. Decidable languages are subset of Turing recognizable languages.



Choice (B)

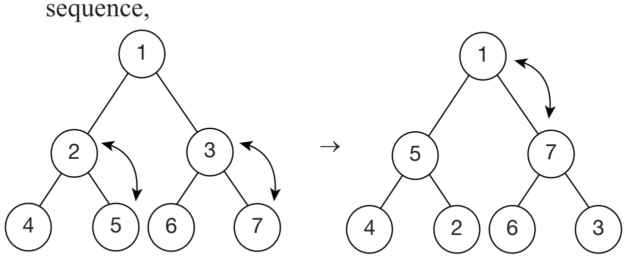
27. The address used by hosts during booting is 0.0.0.0. Choice (A)

28. A repeater can't connect two LANs. It is used to connect two segments of the same LAN. Choice (C)

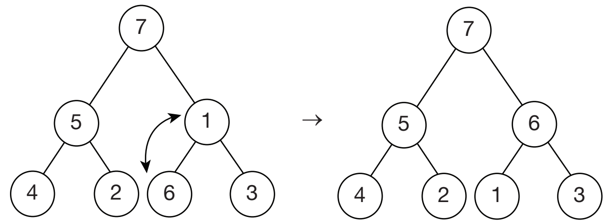
29. Load factor (α) $= \dfrac{\text{Number of elements}}{\text{Number of slots}} = \dfrac{5000}{40} = 125$

Choice (B)

30. Given elements 1, 2, 3, 4, 5, 6, 7
First construct a complete binary tree with the given sequence,



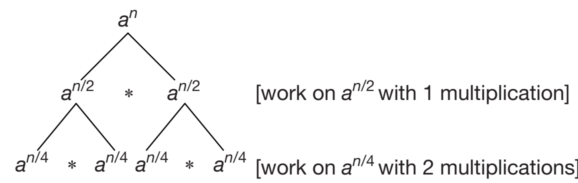
2 - Swaps 1 - Swap



1 - Swap

$\therefore$ 4-Swaps required to convert the tree into MAX-HEAP. Choice (C)

31.



At each level we consider only 'half' problem, so the recurrence relation would be

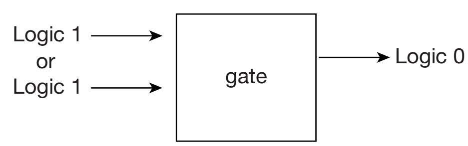
$T(n) = T\left(\dfrac{n}{2}\right) + C$ Choice (D)

32. B is weak entity set, it should be associated with the attributes of strong entity set that is A. Choice (B)

33. If no specific condition is given, the query will return cross product of student and department. Choice (B)

34. Functionally complete set are
(NOT, AND) and (NOT, OR) Choice (C)

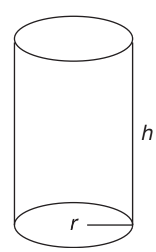
35. The boiler temperature or pressure when exceeds a specific maximum value, then alarm has to be activated. Pressure, temperature sensors produce HIGH voltage (Logic 1) when exceeds maximum value. Alarm requires low voltage (Logic 0) to get activated.



The above circuit can be implemented by NOR gate.

Choice (B)

36.



Let r and h be the radius and height of the cylindrical cistern with surface = 108π sq. feet

$\therefore \quad 2\pi rh + \pi r^2 = 108\pi$

$\Rightarrow \quad 2rh = 108 - r^2$

$\Rightarrow \quad h = \dfrac{108 - r^2}{2r} \rightarrow (1)$

Volume of the cylindrical cistern $= C = \pi r^2 h$

$= \pi r^2 \left(\dfrac{108 - r^2}{2r} \right)$

$\therefore \quad V = \dfrac{\pi}{2}(108r - r^3) \rightarrow (2)$

Let $f(r) = \dfrac{\pi}{2}(108r - r^3)$

$\therefore$ We have to find the maximum value of V.

$f'(r) = \dfrac{\pi}{2}(108 - 3r^2)$

$f'(r) = 0$

$\Rightarrow \quad \dfrac{\pi}{2}(108 - 3r^2) = 0$

$\Rightarrow \quad 108 - 3r^2 = 0$

$\Rightarrow \quad r^2 = 36 \quad \Rightarrow \quad r = 6$

And f'' (r) $= -3\pi r < 0$ for $r = 6$

$\therefore \quad f(r)$ is maximum at $r = 6$

Hence the maximum volume of the cistern

$= V$ at $x = 6$

$= \dfrac{\pi}{2}(108 \times 6 - 6^3)$

$= 216\pi$ cubic feet. Choice (A)

37. Given –1, 2 and 5 are the eigenvalues of A.

$\therefore \quad -1 + 2, 2 + 2$ and $5 + 2$ are the eigenvalues of $A + 2I_3$

i.e., 1, 4 and 7 are the eigenvalues of $A + 2I_3$

$\therefore$ Det $(A + 2I_3) = |A + 2I_3|$ = Product of the eigenvalues of $A + 2I_3$

$= 1 \times 4 \times 7 = 28$

$\Rightarrow$ Determinant of inverse of $A + 2I_3$

$= |(A + 2I_3)^{-1}| = \dfrac{1}{|A + 2I_3|} = \dfrac{1}{28}$ Choice (D)

38. Let B_1 and B_2 denote the events of selecting an engineering graduate and a science graduate respectively.

Let A be the event of selecting a youngster who is self employed.

$\therefore \quad P(B_1) = \dfrac{60}{100} = 0.6, P(B_2) = \dfrac{40}{100} = 0.4$

$P(A/B_1) = \dfrac{45}{100} = 0.45$ and $P(A/B_2) = \dfrac{30}{100} = 0.3$

If the youngster selected is found to be self employed, then the probability that the person is a science graduate

$$= P(B_2/A) = \frac{P(B_2) \cdot P\left(\frac{A}{B_2}\right)}{P(B_1) \cdot P\left(\frac{A}{B_1}\right) + P(B_2) \cdot P\left(\frac{A}{B_2}\right)}$$

(By Baye's Theorem)

$$= \frac{0.4 \times 0.3}{(0.6 \times 0.45) + (0.4 \times 0.3)} = \frac{12}{39} = 0.3077$$

Ans: 0.29 to 0.31

39. We know that, one can define a function from any finite non-empty set to any finite non-empty set.

One can define a one-one function from A to B, only if $n(A) \leq n(B)$.

One can define an onto function from A to B only if $n(A) \geq n(B)$.

Hence options (A), (B) and (C) are not true.

One can define a bijection from A to B, if $n(A) = n(B)$.

$\therefore$ The number of bijections from $A = \{a, b, c, d, e\}$ to $B = \{p, q, r, s, t\}$ is $5! = 120$. Choice (D)

40. We know that the chromatic number of a cycle graph of odd order is 3, a wheel graph of even order is 4 and a bipartite graph as well as a tree is 2.

$\therefore$ The correct matching is

$P - 2, Q - 2, R - 1$ and $S - 1$ Choice (C)

41. fun (6) prints 1 2 3 4 5. Choice (D)

42.

	P_1	P_2	P_3	P_4	P_3	P_4	P_3	P_4	P_2	P_3	P_4	P_2	P_3	P_4	P_2	P_3	P_4	P_1	P_2	P_3	P_4	

0 1 2 4 8 10 11 12 13 14 15 16 17 18 19 20 21 22 23 24 25 26 27

In this way process P_3 completes 42 Ans: 42

43. Page size = ∀P" Mb

$= 2^{20+\log_x^P}$

Bits required for page $= (20 + \log_2 P)$ bits

Number of frames $= 2^{[F-(20+\log_2 P)]}$

Number of pages $= 2^{[L-(20+\log_2 P)]}$

Page table size $= [F - 20 - \log_2 P] * 2^{[L-(20+\log_2 P)]}$ bits

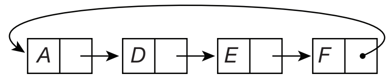
Choice (A)

44. Need matrix = max – Allocated

	R_1	R_2	R_3	R_4	R_5
P_1	0	1	1	0	1
P_2	1	1	1	0	0
P_3	1	0	0	0	0
P_4	1	1	1	0	0
P_5	1	1	1	0	0

Choice (A)

45. It deletes two elements. The resultant list will be

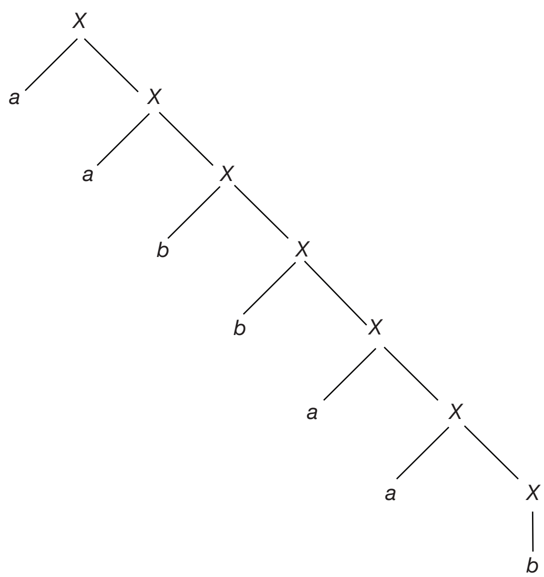


Choice (B)

46. Choice (C)

47. Given grammar is SLR(1) but not LL(1). Choice (B)

48.



Choice (D)

49. Using a 2-bit counter-based prediction scheme, the predictor will be initially False.
This scheme needs two consecutive wrong predictions to change its prediction.
For loop 2, first two predictions are F and F. And in 3rd prediction it predicts T. This prediction continues till $i = 1000$. But this is wrong prediction.

$\therefore$ In total 1001 predictions, 3 are wrong predictions.

$\therefore$ prediction accuracy for loop 2 is $\frac{998}{1001} \times 100 = 99.7\%$

For cond 1, which is tested for 1000 times, correct predictions using 2-bit predictor is 750.
Initially the predictor has Not-taken. (NT). Then the 2-bit predictor will not change to Taken, until two successive mis-predictions happen. But this will never happen.
The predictor mis-predicts 250 times. (1000/4 = 250).

$\therefore$ Cond 1 prediction accuracy $= \frac{750}{1000} \times 1000 = 75\%$.

For cond 2, which is tested for 1000 times, correct predictions using 2-bit predictor is 500.
Initially the predictor has Not-taken. Then the 2-bit predictor will not change to taken until two successive Mis-predictions happen. But this will never happen.

$\therefore$ The predictor Mis-predicts 500 times. (1000/2 = 500).

$\therefore$ Cond 2 prediction accuracy $= \frac{500}{1000} \times 100 = 50\%$.

Choice (B)

50. Required cache blocks by the program are:
A, *B*, *A*, *H*, *B*, *G*, *H*, *H*, *A*, *E*, *H*, *D*, *H*, *G*, *C*, *C*, *G*, *C*, *A*, *B*, *H*, *D*, *E*, *C*, *C*, *B*, *A*, *D*, *E*, *F*.
Cache has 128 Bytes.
Block size = 32 Bytes.

Blocks in cache $= \frac{128}{32} = 4$.

Misses occurred for the blocks:
A, *B*, *A*, *H*, *B*, *G*, *A*, *E*, *D*, *H*, *C*, *G*, *C*, *B*, *D*, *A*, *F*.
As there is a miss for *A* (in 3rd position), we can understand that both *A* and *B* are competing for same block location.
D and *H* are competing for same block (as after accessing *D*, we are getting a miss for *H*).
C and *G* are competing for same block (as after accessing *C*, we are getting a miss for *G*).
E and *F* are competing for the same block.

Choice (C)

51. The pipeline diagram during the execution of the program is shown below:

	1	2	3	4	5	6	7	8	9	10	11	12
I_1	IF	ID	EX	MA	WB							
I_2		IF	Stall	Stall	ID	EX	MA	WB				
I_3			IF			ID	EX	MA	WB			
I_4				IF			Stall	ID	EX	MA	WB	
I_5					IF				ID	EX	MA	WB

$\therefore$ 3-stalls occur during the execution.
I_2 stalled till R_1 value is available. I_4 stalled till R_2 is available.

Ans: 3

52. L_1 is regular and its regular expression is
$0^* \, 1 \, (0 + 1) \, (0 + 1) \, (0 + 1)^*$
L_2 is regular. We can check this by taking an example regular language.

If L contains even number of 1's then L_2 contains odd number of 1's (by deleting '1' from all the strings of L). L_3 is regular. It can be written as, $\{a^{3n} \mid n \geq 0\}$.
i.e., L_3 contains number of a's which is a multiple of a.

Choice (D)

53. Given grammar,
$S \rightarrow 0S1 \mid 1X \mid X0$
$X \rightarrow 1X \mid 0X \mid \varepsilon$
Let us derive some strings from given productions:

$S \rightarrow 0S1$
$\rightarrow 01X1$
$\rightarrow 011$
$n_0(\omega) < n_1(\omega)$

$S \rightarrow 0S1$
$\rightarrow 0\,X\,01$
$\rightarrow 001$
$n_0(\omega) > n_1(\omega)$

$S \rightarrow 0S1$
$\rightarrow 01X1$
$\rightarrow 010X1$
$\rightarrow 010X1$
$\rightarrow 0101 \Rightarrow n_0(\omega) = n_1(\omega)$

$S \rightarrow 1X$
$\rightarrow 11X$
$\rightarrow 11$

The strings can start with either 0 or 1. From these derivations, we can conclude that given grammar is complement of $\{0^n\, 1^n \mid n \geq 0\}$

Choice (C)

54. $\{a^n\, b^m\, a^n\, b^m \mid m, n >= 0\}$
This language is decidable but not context-free. The PDA can't check this kind of equality. (Let the PDA pushed n a's and m b's onto the stack but next it has to compare m b's with n a's. So this is not CFG).
$\{\omega \in \{a, b\}^* \mid$ the length of ω is odd and the first half is all a's$\}$:
We can design a FA which checks whether the length of a string is odd or not. So is CFG. But checking whether the first half is all a's or not is done by using a stack memory.
Hence this is CFL.
$\{\omega \in \{a, b\}^* \mid$ the number of b's in ω is a multiple of the number of a's in $\omega\}$:
This is not CFL. But is decidable. A non-deterministic TM is required to guess the multiple k such that the number of b's is k times the number of a's.
$\{\omega \in \{a, b\}^* \mid$ the number of times 'ab' appears as a substring is equal to the number of times 'ba' appears as a substring$\}$:
This is regular. The regular expression is given as $\varepsilon + a(a + bb^*\, a) + b(b + aa^*\, b)^*$.
Hence the correct choice is (A).

Choice (A)

55. Using Distance vector routing, the initial distance table entries are shown below:

Neighbours	N_1	N_2	N_3	N_4	N_5
N_2	∞	∞	∞	∞	∞
N_4	∞	∞	∞	∞	∞
N_5	∞	6	∞	2	0

Neighbours	N_1	N_2	N_3	N_4	N_5
N_2	1	0	∞	3	6
N_4	∞	3	3	0	2
N_5	7	5	5	2	0

Neighbours	N_1	N_2	N_3	N_4	N_5
N_2	1	0	3	3	5
N_4	4	3	3	0	2
N_5	6	5	5	2	0

Neighbours	N_1	N_2	N_3	N_4	N_5
N_2	1	0	3	3	5
N_4	4	3	3	0	2
N_5	6	5	5	2	0

For warding table of N_5:

Destination	Next hop
N_1	N_4
N_2	N_4
N_3	N_4
N_4	N_4

Choice (C)

56. Given subnet 137.132.96.0/20.
IP address is 137.132.96.0
Its Binary equivalent is
10001001.10000100.01100000.00000000
Subnet mask is /20. i.e., the IP address of mask is
11111111.11111111.11110000.00000000
So the address range using this mask is 137.132.96.0 to
10001001.10000100.01101111.11111111
i.e., from 137.132.96.0 to 137.132.111.255
only (i), (iii) and (iv) are in this range.

Choice (B)

57. Channel utilization for go-back-N protocol is

$$= \frac{N(1 - P)}{(1 + 2a)(1 - P + NP)}$$

N is window size.
P is probability of error in a frame

$$a = \frac{\text{Propagation delay}}{\text{Transmission delay}}$$

$$\text{Transmission delay} = \frac{10000}{10 \times 10^6} = 1 \text{ msec}$$

$$a = \frac{250}{1} = 250$$

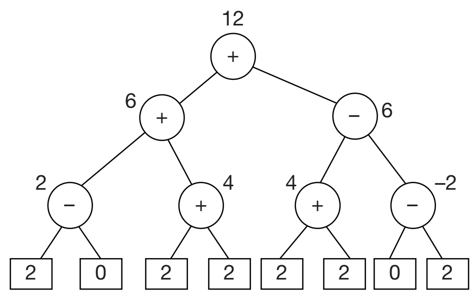
Channel utilization

$$= \frac{7 \times (1 - 0.001)}{(1 + 2 \times 250)(1 - 0.001 + 7 \times 0.001)} = \frac{6.993}{504.006}$$

$= 0.0138$

$\cong 1.38\%$ Ans: 1.38

58.



The maximum possible value of the tree is 12.

Choice (D)

59. $T(n) = 4T\left(\frac{n}{2}\right) + \frac{n^2}{\log n} \Rightarrow 4T\left(\frac{n}{2}\right) + n^2 \log^{-1} n$

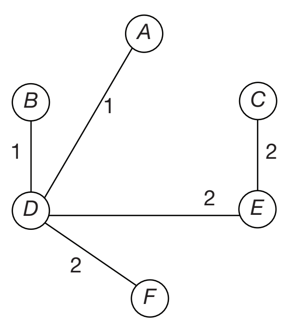
Compare the given Relation with

$T(n) = aT\left(\frac{n}{b}\right) + n^k \log^p n$

If $p = -1$, then according to master method time complexity is $T(n) = \theta(n^{\log_b^a} \cdot \log \cdot \log n)$

$= \theta(n^2 \cdot \log \cdot \log n)$ Choice (C)

60. Minimum spanning Tree T:



Leaf node:

The degree of node must be 1.

In the Tree T (A, B, C) nodes are leaf nodes.

Total weight = 2 + 2 + 2 + 1 + 1 = 8 Choice (A)

61. A Relation with only two attributes with unique values will be in 1 NF, 2 NF, 3 NF, BCNF.

Student

RNo	Name

Case 1:

It can have one FD

RNo → Name

It is in 1 NF, 2 NF, 3 NF, BCNF.

Case 2:

It can have one FD

Name → RNo

It is in 1 NF, 2 NF, 3 NF, BCNF.

Case 3:

It can have 2 FDs.

RNo → Name

Name → RNo

It is in 1 NF, 2 NF, 3 NF, BCNF Choice (D)

62. Assume some data:

Student

SName
A
B
C

Department

DName
Sales
Tax
Finance

Register

Sname	DName
A	Sales
B	Tax

Department π_{Dname} (Register)

DName
Sales
Tax
Finance

−

DName
Sales
Tax

=

DName
Finance

In the Finance department, there are no students.

Choice (A)

63. Minterms of P

$w^1x^1z^1 + w^1yz^1 + xz + wx^1$

00×0 0×10 ×1×1 10××

0, 2 2, 6 5,7,13,15 8,9,10,11

$\Sigma m(0, 2, 5, 6, 7, 8, 9, 10, 11, 13, 15)$

min terms of Q

$x^1z^1 + wz + xz + w^1x$

$x0x0$ $1xx1$ $x1x1$ $01x\,x$

0, 2, 8, 10 9, 11, 13, 15 5, 7, 13, 15 4, 5, 6, 7

$\Sigma m(0, 2, 4, 5, 6, 7, 8, 9, 10, 11, 13, 15)$

which is not equal to f

Choice (D)

64.

Clk	Q_3	Q_2	Q_1	Q_0	Preset = $\overline{Q_3 + Q_2}$
0	1	1	1	1	0
1	1	1	1	0	0
2	1	1	0	1	0
:	:	:	:	:	:
:	:	:	:	:	:
10	0	1	0	1	0
11	0	1	0	0	0
12	0	0	1	1	1
13	1	1	1	1	0

Active high preset, so when output of NOR gate is 1, then preset activated, and output becomes 1111 in next clk pulse (synchronous input)

From the above table, we can understand that after 13 clk pulses the counter came to original state. So it is Mod 13 counter Choice (C)

65.

6	1	4	5	3	2
W	*A*	*N*	*T*	*E*	*D*
T	*H*	*I*	*S*	*T*	*A*
S	*K*	*I*	*S*	*I*	*M*
P	*O*	*S*	*S*	*I*	*B*
L	*E*	*A*	*B*	*C*	*D*

Give the numbering to the letters in the keyword. Plain text is written as it is. If some gaps are there, fill it with *A*, *B*, C, ..., *Z*

In the cipher text, the letters under Number 1 column would appear first then Number 2 column and so on

1. HKOE 2. AMBD
3. TIIC 4. IISA
5. SSSB 6. TSPL Choice (C)

Mock Test 5

Number of Questions: 65 **Total Marks: 100**

Wrong answer for MCQ will result in negative marks, (–1/3) for 1 Mark Questions and (–2/3) for 2 Marks Question.

General Aptitude

Number of Questions: 10 **Section Marks: 15**

Directions for question 1: Choose the most appropriate word from the options given below to complete the following sentence:

1. If I ___________ you I would not have taken the help of an outsider to solve my personal problems.
(A) was (B) were
(C) am (D) will be

Directions for questions 2 and 3: Select the correct alternative form the given choices.

2. Ram and Shyam started simultaneously from two different stations towards each other with speeds of x kmph and y kmph respectively. To cross each other, Ram travelled y times the distance travelled by Shyam. If the speed of Ram is 4 kmph, then the speed (in kmph) of Shyam is ______.

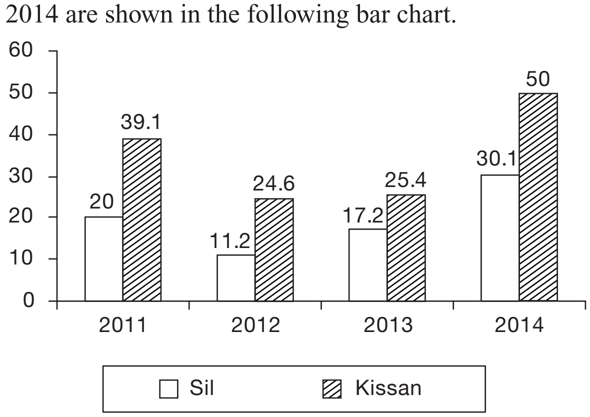
3. How is Khadar's wife's daughter's mother's daughter-in-law's husband's father related to Khadar?
(A) Grand-father (B) Father
(C) Father-in-law (D) Himself

Directions for question 4: Which one of the following combinations is incorrect?

4. (A) Beatific–Mundane
(B) Empirical–Experiential
(C) Gaunt–Emaciated
(D) Momentous–Critical

Directions for question 5: Select the correct alternative form the given choices.

5. The sales (in crores of ₹) of Kissan and Sil Mixed Fruit jams in Khaogali in each of the years from 2011 to 2014 are shown in the following bar chart.



The ratio of sales of Kissan to that of Sil is the highest in ______.
(A) 2012 (B) 2011
(C) 2013 (D) None of these

Directions for question 6: Select the alternative meaning of the underlined part of the sentence:

6. The government officials have promised the moon on the issue of regulation for industrial relations and so, have decided not to sign any new ventures.
(A) passed the buck
(B) broadened their horizons
(C) stood their ground
(D) heard something on the grapevine

Directions for question 7: The given statement is followed by some course of action. Assuming the statement to be true, decide the correct option:

7. Healthcare workers often reuse syringes or needles for multiple uses which increases the chance of infection and transmission of ailments, thus exposing people to a host of diseases from clinics, nursing homes and hospitals.
(i) Hospitals must encourage staff to incorporate smart disposal techniques.
(ii) Healthcare workers and patients must be made aware of WHO policy guidelines on safe injection practices.
(iii) Patients acquiring diseases from hospitals and nursing homes must be treated free of cost.
(iv) The government of India must make it mandatory for hospitals to switch from disposable syringes to Auto Disposable (AD) syringes.
(A) (i) and (iii) (B) (ii) and (iii)
(C) (i) and (ii) (D) (ii) and (iv)

Directions for questions 8 and 9: Select the correct alternative form the given choices.

8. Evaluate $\sqrt{5+\sqrt{5-\sqrt{5+\sqrt{5...}}}}$.

(A) $\dfrac{\sqrt{13}-1}{2}$ (B) $\dfrac{\sqrt{17}-1}{2}$

(C) $\dfrac{\sqrt{17}+1}{2}$ (D) $\sqrt{17}$

9. America had entered the world war since Japan had attacked Pearl Harbour.
Which one of the statements below is logically valid and can be inferred from the above sentence?

(A) Japan was feeling restless.
(B) America would not have entered the world war, if Japan would not have attacked Pearl Harbour.
(C) Japan and America are enemies.
(D) None of these

Directions for question 10: Out of the four sentences, select the most suitable sentence with respect to grammar and usage:

10. (A) Today's tip would have been sufficient to buy a full meal three years ago.
(B) Todays tip would pay for a full meal three years ago.
(C) Today's tip would be sufficient for a three- years-ago meal.
(D) A tip today would costed one a meal three years back.

Computer Science Engineering

Number of Questions: 55 **Section Marks: 85**

Directions for questions 11 to 65: Select the correct alternative from the given choices

11. The non-identity element (the element other than the identity element) which is the inverse of itself in the abelian group (G, X_7) with $G = \{1, 2, 3, 4, 5, 6\}$ under the binary operation of "multiplication module 7" is ______.

12. The value of the definite integral $\int_0^{\pi} \sin^8 x\, dx$ is______.

(A) $\frac{7^2.5^2.3^2.1^2}{8!}\pi$ (B) $\frac{8^2.6^2.4^2.2^2}{7!}\pi$

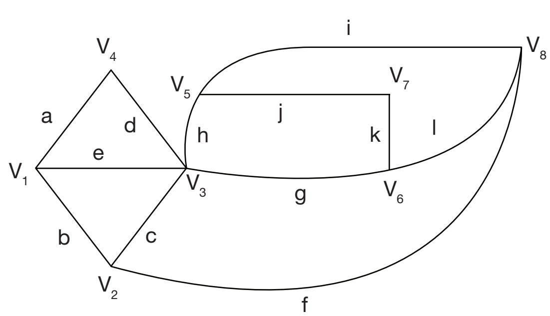
(C) $\frac{7^2.5^2 3^2.1^2}{8!}\cdot\frac{\pi}{2}$ (D) $\frac{8^2.6^2.4^2.2^2}{7!}\cdot\frac{\pi}{2}$

13. In the LU decomposition of a matrix $A = \begin{bmatrix} 3 & 1 & 2 \\ 6 & 4 & 5 \\ 9 & 7 & 11 \end{bmatrix}$ with each of the principal diagonal element of L being equal to 1, the matrix L is equal to _____.

(A) $\begin{bmatrix} 1 & 0 & 0 \\ 2 & 1 & 0 \\ 3 & 2 & 1 \end{bmatrix}$ (B) $\begin{bmatrix} 1 & 2 & 3 \\ 0 & 1 & 2 \\ 0 & 0 & 1 \end{bmatrix}$

(C) $\begin{bmatrix} 1 & 0 & 0 \\ 2 & 1 & 0 \\ 1 & 3 & 1 \end{bmatrix}$ (D) $\begin{bmatrix} 1 & 2 & 1 \\ 0 & 1 & 3 \\ 0 & 0 & 1 \end{bmatrix}$

14. Consider the graph G given below:



G

Which of the following sets of edges is NOT a perfect matching of G?
(A) $\{a, c, i, k\}$ (B) $\{d, e, f, j\}$
(C) $\{b, d, j, l\}$ (D) $\{a, f, g, j\}$

15. The number of non-negative integral solutions of the inequality $x_1 + x_2 + x_3 + x_4 < 13$ is ______.

16. Consider the grammar ('X' is start symbol)
$X \rightarrow Y Z a \mid Z$
$Y \rightarrow S Y \mid \in$
$Z \rightarrow c \mid \in$
$S \rightarrow s \mid b$
The follow(S) is:
(A) $\{c, s, b\}$
(B) $\{s, b, \$\}$
(C) $\{s, b\}$
(D) $\{s, b, c, a\}$

17. Consider the code:
int x, y;
$x = y + 15$;
Checking the type of variable while assigning in the Code is done during:
(A) Run time
(B) Load time
(C) Compile time
(D) Link time

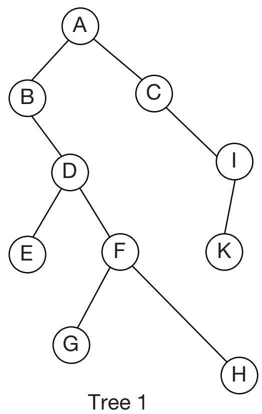
18. Consider a system with five processes and a single resource of multiple instances.

	Allocation	Maximum needed
P_1	2	4
P_2	2	3
P_3	4	10
P_4	3	8
P_5	1	6

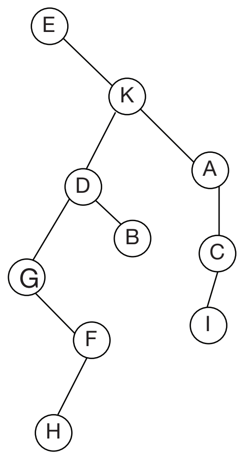
Then minimum number of resources need to be available, for the system to be in safe state is ______.

19. Consider a counting semaphore value as 25, if 33 down operations are performed followed by 40 up operations, then resultant value of semaphore is ______.

20. Consider below trees:



Tree 1



Tree 2

Which traversal of Tree 1 and Tree 2 will produce same sequence?

(A) Pre order, Post order (B) Post order, In order
(C) In order, Post order (D) Post order, Pre order

21. Number of possible permutations that can be obtained using stack if the input sequence is 1, 2, 3, 4, 5 (in the order) is ______.

22. The maximum number of elements in a heap of height 10 (Assume height of root node as 0) is ______.

23. Consider a branch predictor which uses a Branch History Table (BHT). Program Counter (PC) uses 8-bits to select the BHT entry and the history covers the last 8 branches and uses 2-bit predictor. The number of bits required for the storage of BHT is __________.

24. Consider a main memory which has 32-bit address. There is a 4-way set-associative cache. 5-bits of main memory address are used for set index and 4-bits required for Byte offset. The number of bytes required for cache data portion is __________.

25. Consider the regular expression:
$2^* (1 + \varepsilon) (01)^* (0 + \varepsilon)$,
over the alphabet $\Sigma = \{0, 1, 2\}$. Which of the following gives the language specified by given Regular expression?

(A) $\{w|$ the start and end symbols of w are not same$\}$
(B) $\{w|$ every 0 that is not right most symbol is immediately followed by a 1 and every 1 that is not rightmost symbol is immediately followed by a 0$\}$
(C) $\{w|$ There is an equal number of 0's and 1's in $w\}$
(D) $\{w|$ every 0 that is not right most symbol is immediately followed by a 1$\}$

26. Which of the following language(s) is/are closed under union, intersection and complementation?

(i) Regular language
(ii) Context-free language
(iii) Recursive language
(iv) Recursively enumerable language

(A) (i) only (B) (i), (iii) only
(C) (i), (iii), (iv) only (D) (i), (ii), (iii), (iv)

27. Consider 8 stations numbered 1 to 8, whose addresses are 10101, 01100, 11101, 00010, 00101, 01010, 11100, 10011 respectively. These 8 stations want to send data through a single channel using Binary countdown protocol. Then the station which starts transmission of data out of all 8 stations is __________.

28. Using RSA public key cryptography, if $p = 7$, $q = 11$ and $d = 7$ then which of the following is a valid 'e' value?

(A) 108 (B) 170
(C) 43 (D) 10

29. Which of the following algorithms sort 'n' integers having the range (1 to n^2), in ascending order in $O(n)$ time?

(A) Radix sort (B) Selection sort
(C) Merge sort (D) Quick sort

30. Which of the following is FALSE about Weak Entity?

I. A Weak Entity set has no primary keys unless attributes of the strong entity set on which it depends are included.
II. Weak entities can be deleted automatically when their strong entity is deleted.

(A) I only (B) II only
(C) Both I and II (D) Neither I nor II

31. Which of the following is asymptotically smaller?

(A) $\log_2 (n!)$ (B) $\log_2 (\log n)$
(C) $\log (\log n^2)$ (D) $\log (\log_2 n!)$

32. $\pi_A (\sigma_B (R \times S))$ is equivalent to which of the following?

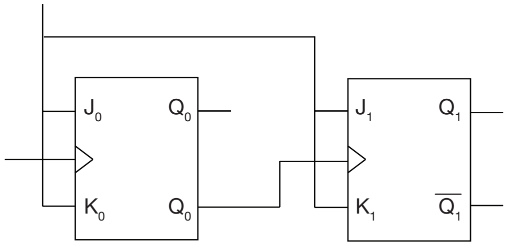
(A) Select A
From R, S
Where B

(B) Select DISTINCT(A)
From $R \times S$
Where B

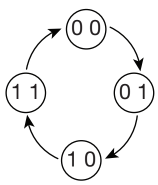
(C) Select DISTINCT(A)
From R, S
Where B

(D) All the above

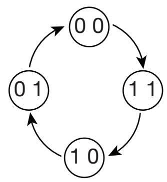
33. For the counter shown in figure, find the state diagram for the states $Q_1\, Q_0$?



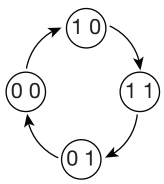
(A)



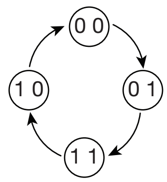
(B)



(C)



(D)



34. Consider the following Relation:
CREATE TABLE Authoring
(ArticleID INT REFERENCES Article(ID) ON DELETE SET NULL
AuthorID INT REFERENCES Author(ID) ON DELETE CASCADE)

I. If we delete a tuple from Article, some attributes of Authoring may have their values SET to NULL.
II. If we delete a tuple from Authoring, any tuples in Author referred to by this tuple are also deleted.

Which of the following is TRUE?
(A) I only (B) II only
(C) I and II (D) None of these

35. Consider the following schema.
Student (Roll-No, Name, Gender, Age, Marks, Address)
Among the given attributes Roll No, Name, Age are uniquely identified. Which of the following is NOT a super key?
(A) {Roll No, Name, Age, Gender, Marks}
(B) {Age, Gender, Marks, Address}
(C) {Gender, Marks, Address}
(D) {Gender, Marks, Address, Name}

36. If the system of linear equations
$2x_1 + 3x_2 + 5x_3 + 7x_4 = 0$
$-2x_2 + ax_3 = 0$
$3x_3 + 2x_4 = 0$
$6x_2 + bx_4 = 0$
has a non-trivial solution, then 'a' and 'b' are related by _____.
(A) $a + 2b = 0$ (B) $a - 2b = 0$
(C) $2a + b = 0$ (D) $2a - b = 0$

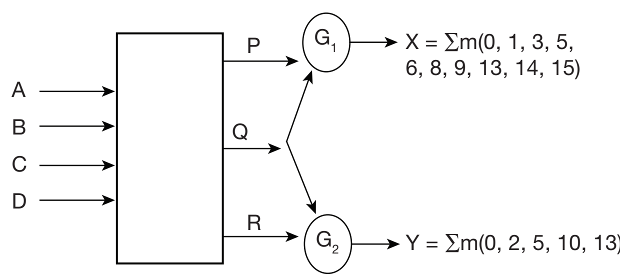
37. The coefficient of x^3 in the Maclaurin's series expansion of $(1 - x)^{5/2}$ is ______.

38. A fair die is rolled twice. Let X denote the number on the die in the first roll and let Y denote the number on the die in the second roll. Then the value of:
$P(X + Y = 6/X - Y = 2)$
is ______.
(A) $\frac{1}{2}$ (B) $\frac{1}{4}$
(C) $\frac{1}{8}$ (D) $\frac{1}{16}$

39. Consider a relation $R = \{(x, y)/x, y \in Z^+$ and 'xy' is a perfect square$\}$ over the set of positive integers. Which of the following statements is/are TRUE about the relation R?
I. R is an equivalence relation.
II. R is a partial ordered relation.
(A) I only (B) II only
(C) Both I and II (D) Neither I nor II

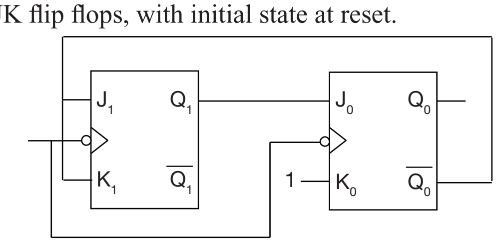
40. The dual of the statement formula "$p \to (\neg q \to r)$" is _____.
(A) $\neg p \to (q \to r)$ (B) $p \to (q \to \neg r)$
(C) $\wedge p \neg q \wedge r$ (D) $p \wedge q \wedge r$

41. Given Combinational network with four inputs A, B, C, D and three intermediate outputs P, Q, R and two outputs X and Y as shown in figure.



Assuming that G_1 is NAND gate, and G_2 is AND gate, find the smallest function 'Q'. (with minimum number of min terms) which makes it possible to produce X and Y?
(A) $\bar{A}\bar{C}D + A\bar{C}\bar{D} + \bar{A}B + B\bar{C}\bar{D}$
(B) $\bar{A}\bar{B} + \bar{A}C\bar{D} + \bar{A}C\bar{D} + \bar{B}C\bar{D}$
(C) $\bar{A}\bar{B} + \bar{A}C + B\bar{C}$
(D) $\bar{A}\bar{B}\bar{D} + \bar{A}BD + A\bar{B}C + B\bar{C}$

42. Consider the following synchronous counter with JK flip flops, with initial state at reset.



If the JK flip flops have to be replaced by D flip flops, for the same sequence then the D flip flop inputs D_1, D_0 are (corresponding to Q_1, Q_0 flip flops)

(A) $D_1 = Q_1 \oplus Q_0, D_0 = Q_1 \bar{Q}_0$

(B) $D_1 = Q_1 \odot Q_0, D_0 = Q_1 \bar{Q}_0$

(C) $D_1 = Q_1 + Q_0, D_0 = Q_1 \oplus Q_0$

(D) $D_1 = Q_1 \odot Q_0, D_0 = Q_1 + \bar{Q}_0$

43. Consider a word addressed memory hierarchy system with the following parameters:
Block size = 16 words
Main memory size = 64 blocks
Cache size = 8 blocks
The cache uses direct mapped technique. The tag values in the cache directory are:

Cache line number	Tag
0	000
1	101
2	100
3	010
4	101
5	010
6	100
7	001

Then which of the following main memory addresses will be a hit in cache?

(i) $(37A)_{16}$ (ii) $(22C)_{16}$
(iii) $(00C)_{16}$ (iv) $(1B9)_{16}$

(A) (i), (ii), (iii), (iv) (B) (ii), (iv)
(C) (i), (iii) (D) (ii), (iii)

44. Consider the following bit pattern:
1010 1101 0001 0000 0000 0000 0000 0000
Which of the following statements is/are correct?

(i) If the given bit pattern represents a 2's complement integer then its decimal equivalent is $(-1391460352)_{10}$.
(ii) If the given bit pattern represents an unsigned integer then its decimal equivalent is $(2804507955)_{10}$.
(iii) If the given bit pattern represents an IEEE 754 single precision floating point number then its decimal equivalent is $(-8.185 * 10^{-12})$

(A) (i) only (B) (i) and (iii)
(C) (ii) and (iii) (D) (i), (ii), (iii)

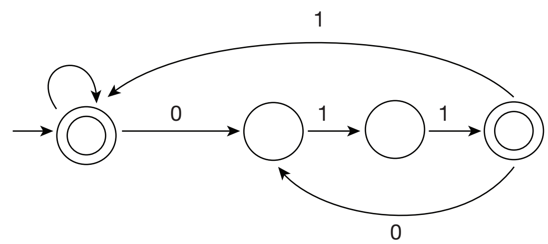
45. Which of the following statement is TRUE?

I. Assuming the same cache size and same block size, increasing set associativity of a cache reduces conflict misses.
II. Assuming the same set associativity and the same block size, increasing the size of a cache reduces compulsory misses.
III. Smaller caches have shorter hit time than larger caches.
IV. Increasing set associativity increases hit time.

(A) I, II, III (B) II, III, IV
(C) I, III, IV (D) I, II, IV

46. Construct a minimized DFA, M which accepts the binary strings w such that when you reverse w you get a binary integer that is divisible by 5.
If M has x states and y self-loops then the product of $x * y$ is ________.

47. Consider the following languages:
L_1 is the language described by 1* (0111*)*.
L_2 is the language of strings with atleast one 0 and atleast two 1's.
L_3 is the language of below finite automata:



L_4 is the language described by (0 + 1)* 01 (0 + 1)* 1.
Which of the following is TRUE?

(i) $L_1 = L_3$ (ii) $L_1 \subset L_4$ (iii) $L_4 \subset L_2$

(A) (i) only (B) (i), (iii) only
(C) (ii), (iii) only (D) (i), (ii), (iii)

48. Which of the following language is Decidable?

I. Checking whether a given natural number is prime or not.
II. {<M>| M is a DFA and $L(M) = \Sigma^*$}
III. Post correspondence problem (PCP).

(A) (I), (II) (B) (II), (III)
(C) (I), (III) (D) (I), (II), (III)

49. Consider sending a 2500 Byte datagram into a link which has a maximum transmission unit (MTU) of 700 Bytes. The datagram has an identification number 422. The number of fragments generated and their respective fragmentation offset values will be:

(A) 4; 0, 680, 1360, 2040
(B) 5; 0, 700, 1400, 2100, 2800
(C) 4; 0, 85, 170, 255
(D) 5; 0, 85, 170, 255, 340

50. Four equal-sized datagrams belonging to the same message leave for the destination one after another. These datagrams travel through different paths as given below:

Datagram	Path length	Visited switches
1	3000 km	1, 3, 5
2	10,800 km	1, 2, 5
3	13,000 km	1, 2, 3, 5
4	10,000 km	1, 4, 5

Assume that the delay for each switch is 2, 9, 23, 7 and 18 ms respectively. If the propagation speed is $2*10^8$ m, then the delays of the datagrams 1, 2, 3, 4, respectively is:

(A) 15 m sec, 54 m sec, 65 m sec, 50 m sec.
(B) 58 m sec, 83 m sec, 116 m sec, 77 m sec.

(C) 15 m sec, 83 m sec, 65 m sec, 77 m sec.
(D) 58 m sec, 54 m sec, 116 m sec, 50 m sec.

51. A multicast address for a group is 232.48.60.9. What is its equivalent 48-bit Ethernet address for a LAN using TCP/IP?
(A) 01:00:5E:7F:30:C0
(B) 01:1B:C2:43:03:C0
(C) 33:33:5E:30:3C:09
(D) 01:00:5E:30:3C:09

52. Quick sort algorithm is run on two inputs shown below to sort in ascending order:
(i) A sequence of 'n' even numbers, 2, 4, 6, 8… n.
(ii) A sequence of 'n' odd numbers, 1, 3, 5, 7…n.
Let A_1 and A_2 be the number of comparisons made for the inputs (i) and (ii) respectively, then:
(A) $A_1 > A_2$
(B) $A_1 < A_2$
(C) $A_1 = A_2$
(D) Cannot be determined

53. A binary search tree is used to locate the number 86. Few probe sequences are given below:
I. 102, 78, 98, 87, 90, 88, 86
II. 200, 190, 198, 76, 84, 77, 85, 86
III. 140, 139, 110, 120, 109, 86
IV. 100, 96, 92, 90, 83, 84, 86
Which of the following probe sequence(s) is/are possible to locate '86'?
(A) I and II (B) I and III
(C) III and IV (D) IV only

54. Given the alphabets A, B, C, D, E, F, G and H with the probabilities
$\frac{2}{40}, \frac{2}{40}, \frac{3}{40}, \frac{4}{40}, \frac{6}{40}, \frac{6}{40}, \frac{13}{40}$ respectively.
The average Huffman code size in bits per symbol is ________.
(A) $\frac{99}{40}$ (B) $\frac{101}{40}$
(C) $\frac{111}{40}$ (D) $\frac{121}{40}$

55. The following relation schema can be used to register information on the repayments on loans.
Repayment (Borrower-Id, name, address, loan-amount, request-date)
A borrower is identified with a unique borrower-id, and has only one address and name. Borrowers can have multiple simultaneous loans, but they always have different request-dates.
What is the key for Repayment?
(A) Borrower-Id
(B) Borrower-Id, request-date
(C) Borrower-Id, loan-amount
(D) request-date, loan-amount

56. Consider the SQL query given below:
DELETE
FROM Loan A
WHERE loan-amount = (SELECT SUM (repayment - amount))
FROM Loan-Payment B
WHERE B.Customer-Id = A.Customer-Id AND B.request-date = A.request-date
The above query
(A) Deletes all information of customers who have requested loan amount on same day.
(B) Deletes all information on ended loans, where the total repaid amount equals the lend amount.
(C) Deletes all information of customers whose have requested the same amount.
(D) None of the above

57. Match the following:

Set–1	Set–2
(P) Belady's anomaly	(a) Round Robin scheduling
(Q) Banker's algorithm	(b) Deadlock avoidance
(R) Time sharing system	(c) Deadlock prevention
(S) Simple Paging	(d) FIFO page replacement policy
	(e) Internal fragmentation
	(f) External fragmentation
	(g) Priority scheduling

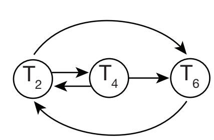
(A) P – g, Q – c, R – g, S – f
(B) P – d, Q – b, R – a, S – e
(C) P – d, Q – b, R – g, S – f
(D) P – d, Q – c, R – a, S – e

58. Consider the following transaction schedule:

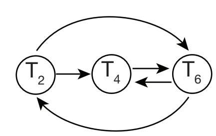
T_2	T_4	T_6
	R(Q)	
W(Q)		
		W(Q)
	R(Q)	
W(Q)		
	W(Q)	

Which of the following is the precedence graph for the above schedule?

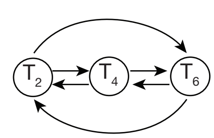
(A)



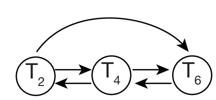
(B)



(C)



(D)



59. Consider the following code:

```
procedure main
    procedure A
        procedure B
            procedure C
              ¦
              end
        end
    end

    procedure D
        ¦
        ¦
        end
end
```

The nesting depth of procedures A, B, C, D is:
(A) 1, 2, 3, 4 (B) 1, 2, 3, 1
(C) 2, 3, 4, 2 (D) 2, 3, 4, 5

60. Consider the grammar:
$G_1 : X \rightarrow X\,y \mid x$
$G_2 : X \rightarrow Y\,X\,y \mid x$
$Y \rightarrow \in$
Which of the following is True?
(A) Only G_1 is LR (1)
(B) Only G_2 is LR (1)
(C) Both G_1 and G_2 are LR (1)
(D) None of the above

61. Consider an AVL tree with root node as "a". Inorder predecessor of root as b, Inorder successor of root as c, the left child of root as d and the right child of root as e. Then which of the following relation is TRUE.
(A) $d < b < a < c < e$ (B) $a < b < c < d < e$
(C) $b < d < a < e < c$ (D) $e < c < a < b < d$

62. Consider the routine fun():
void fun(int x)
{if (x > = 2){fun (x/2); fun (x/2); printf ("#");}}
Number of times the printf() executed when fun(16) is called is ______.

63. Consider the following process table:

	Arrival time	Burst time
P_1	1	4
P_2	2	8
P_3	3	5
P_4	4	6

If Round Robin scheduling (with time slice = 2 units) is used to schedule above processes, then the number of context switches (don't consider start and end context switches) is ________.

64. Consider the postfix expression:
$a\ b + c * d\ e\ f\ g$ ^ ^ - /
consider the following statements:
$S1$: +, − has high precedence over ^ .
$S2$: ^ has high precedence over *, / and ^ associates from left to right.
$S3$: / has high precedence over *
Which of the above statements are TRUE?
(A) $S1$, $S2$ (B) $S1$, $S3$
(C) only $S3$ (D) None of the above

65. Consider a system with 1 GB physical memory and 64-bit virtual address space if the page size is 1 MB then the size of the page table is (size in Tb) ______.

Answer Keys

1. B	**2.** 2	**3.** D	**4.** A	**5.** A	**6.** C	**7.** D	**8.** C	**9.** B	**10.** A

Hints and Explanations

1. The given statement is a hypothetical one. An unreal situation is presented here so the verb "were" is apt. Choice (B)

2. Let t hours be the time taken to cross each other.
Then, distance covered by Ram, to meet the other $= xt$ km → (1)
The distance covered by Shyam, to meet the other $= yt$ km → (2)
But, as per data, (1) is y times (2).
Hence, $xt = (y)\,(yt)$;
$\Rightarrow x = y^2$.
It is given that $x = 4$; hence $y = 2$. Ans: 2

3. Khadar's wife's daughter is Khadar's daughter whose mother is Khadar's wife. Khadar's wife's daughter-in-law is Khadar's daughter-in-law. Her husband's father is Khadar himself. Choice (D)

4. Except (A) all the other combinations have a synonymous relationship. "Empirical" is that which can be practically proved while "emaciated" is lean and weak. Momentous means significant. In (A) both the words are antonyms. Beatific means sublime while mundane is common or coarse. Choice (A)

5. The ratio of sales of Kissan to Sil is the highest in the year 2012 and this highest ratio equals 2.19.

Choice (A)

6. The right idiom to fit the bill is "stood their ground", which means to stick to one's stand on one's decision. To "pass the buck" is to shrug off responsibility, "broaden one's horizons" is to enlarge one's range of activities and world and "to hear something on the grapevine" is to get to know something via rumours. To "promise somebody the moon" is to promise somebody something that is impossible to deliver. Choice (C)

7. Statement (i) is about disposal techniques which is not the point of discussion or the source of the problem. Similarly (iii) is not the point of discussion which actually finds a solution to the problem. The possible solutions are offered in (ii) and (iv). It is necessary to create awareness among public and staff to incorporate safe injection practices and make extensive use of AD syringes. Choice (D)

8. Let $x = \sqrt{5+\sqrt{5-\sqrt{5+\sqrt{5\ldots}}}}$

We can see that $x > \sqrt{5} (\sqrt{5} \approx 2.25)$

Choice (1): $\dfrac{\sqrt{13}-1}{2} \approx \dfrac{3.6-1}{2} \approx 1.3$

Choice (2): $\dfrac{\sqrt{17}-1}{7} \approx \dfrac{4.2-1}{2} \approx 1.6$

$\therefore (x^2-5)^2 = 5-x$ (1)

Now consider $x = \dfrac{\sqrt{17}+1}{2}$ (2)

$\therefore \quad 5-x = \dfrac{9-\sqrt{17}}{2}$

$(2) \Rightarrow x^2 = \dfrac{18+2\sqrt{17}}{4} = \dfrac{9+\sqrt{17}}{2}$

$\therefore \quad x^2-5 = \dfrac{\sqrt{17}-1}{2}$

$\therefore \quad (x^2-5)^2 = \dfrac{18-2\sqrt{17}}{4} = \dfrac{9-\sqrt{17}}{2}$

$\therefore \quad x = \dfrac{\sqrt{17}+1}{2}$ satisfies (1) Choice (C)

9. The sentence which is logically valid and can be inferred from the given sentence is:
America would not have entered the world war if Japan would not have attacked the Pearl Harbour.
Japan's attack on pearl Harbour is cited as the reason for the America entering. Choice (B)

10. Statement (A) is grammatically correct and clearly brings out the intended meaning that a tip today would be enough to buy a meal three years ago. Choice (B) is ungrammatical as "today's" does not use an apostrophe. In (C) "three-years-ago meal" distorts the meaning. (D) uses "would costed" which is ungrammatical. Choice (A)

11. In the abelian group (G, x_7) with $G = \{1, 2, 3, 4, 5, 6\}$ 1 is the identity element.

$\therefore$ If 'a' is the element in G which is the inverse of itself, then $a x_7 a = 1$.

$\Rightarrow$ The remainder when $a \times a$ is divided by 7 should be 1

$\Rightarrow$ $(a \times a) - 1$ should be a multiple of 7

$\Rightarrow$ $a^2 - 1 = 7k$ for some possitive integer k

And among the elements in G, the only element that satisfies this condition is 6.

$\therefore$ $a = 6$

$\therefore$ $6 \in G$ is the inverse of itself. Ans: 6

12. We have $\int_0^{\pi} \sin^8 x\,dx = 2\int_0^{\frac{\pi}{2}} \sin^8 x\,dx$

$$\left(\because \int_0^{2a} f(x)dx = 2\int_0^{a} f(x)\,dx;\ \text{if } f(2a-x) = f(a)\right)$$

$$= 2\left[\frac{8-1}{8}\cdot\frac{8-3}{8-2}\cdot\frac{8-5}{8-4}\cdot\frac{1}{2}\cdot\frac{\pi}{2}\right]$$

$$\left(\because \int_0^{\frac{\pi}{2}} \sin^n x dx = \frac{n-1}{n}\cdot\frac{n-3}{n-2}\cdot\frac{n-5}{n-4}\ldots\frac{3}{4}\cdot\frac{1}{2}\cdot\frac{\pi}{2} \text{ if } n \text{ is even}\right)$$

$$= 2\left[\frac{7}{8}:\frac{5}{6}\cdot\frac{3}{4}\cdot\frac{1}{2}\cdot\frac{\pi}{2}\right]$$

$$= \frac{7^2}{8.7}\cdot\frac{5^2}{6.5}\cdot\frac{3^2}{4.3}\cdot\frac{1^2}{2.1}\pi = \frac{7^2\cdot 5^2\cdot 3^2\cdot 1^2}{8!}\pi.$$ Choice (A)

13. Given $A = \begin{bmatrix} 3 & 1 & 2 \\ 6 & 4 & 5 \\ 9 & 7 & 11 \end{bmatrix}$

As the principal diagonal elements of L are equal to 1 in the LU decomposition of A, we have

$A = LU$ (1)

where $L = \begin{bmatrix} 1 & 0 & 0 \\ l_{21} & 1 & 0 \\ l_{31} & l_{32} & 1 \end{bmatrix}$ and

$$U = \begin{bmatrix} u_{11} & u_{12} & u_{13} \\ 0 & u_{22} & u_{23} \\ 0 & 0 & u_{33} \end{bmatrix}$$

$\therefore$ From (1)

$$\begin{bmatrix} 3 & 1 & 2 \\ 6 & 4 & 5 \\ 9 & 7 & 11 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 \\ l_{21} & 1 & 0 \\ l_{31} & l_{32} & 1 \end{bmatrix} \begin{bmatrix} u_{12} & u_{12} & u_{13} \\ 0 & u_{22} & u_{23} \\ 0 & 0 & u_{33} \end{bmatrix}$$

$$\begin{bmatrix} 3 & 1 & 2 \\ 6 & 4 & 5 \\ 9 & 7 & 11 \end{bmatrix}$$

$$= \begin{bmatrix} u_{11} & u_{12} & u_{13} \\ l_{21}u_{11} & l_{21}u_{12} + u_{22} & l_{21}u_{13} + u_{23} \\ l_{31}u_{11} & l_{31}u_{12} + l_{32}u_{22} & l_{31}u_{13} + l_{32}u_{23} + u_{33} \end{bmatrix}$$

Comparing the corresponding elements on both sides

We have

$u_{11} = 3$; $u_{12} = 1$ and $u_{13} = 2$

$l_{21}u_{11} = 6$

$\Rightarrow \quad l_{21} = \frac{6}{3} = 2$

$l_{21}u_{12} + u_{22} = 4$

$\Rightarrow \quad u_{22} = 4 - 2 \times 1 = 2$

$l_{31}u_{11} = 9$

$\Rightarrow \quad l_{31} = \frac{9}{3} = 3$

$l_{31}u_{12} + l_{32}u_{22} = 7$

$\Rightarrow \quad 3 \times 1 + l_{32} \times 2 = 7$

$\Rightarrow \quad l_{32} = \frac{7-3}{2} = 2$

$\therefore \quad L = \begin{bmatrix} 1 & 0 & 0 \\ l_{21} & 1 & 0 \\ l_{31} & l_{32} & 1 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 \\ 2 & 1 & 0 \\ 3 & 2 & 1 \end{bmatrix}$. Choice (A)

14. A matching of a graph G is a set of edges in G such that no two edges of that set are incident on the same vertex. A perfect matching (Also known as a complete matching) of a graph G is a matching in which every vertex of G is incident on exactly one of the edges of the set of edges in perfect matching.

Among the sets of edges given in options, the set given in option (B), viz $\{d, e, f, j\}$ is NOT a perfect matching because both the edges e and d are incident on the same vertex V_3 and also, the vertex V_6 is incident on none of the edges given in the set. Choice (B)

15. We know that the number of non-negative integral solutions of $x_1 + x_2 + x_3 + ... + x_n \le r$.

= The number of non negative integral solutions of $x_1 + x_2 + x_3 + ... + x_n + x_{n+1} = r$.

$\therefore$ The number of non negative integral solutions of $x_1 + x_2 + x_3 + x_4 < 13$

The number of non-negative integral solutions of $x_1 + x_2 + x_3 + x_4 \le 12$

= The number of non-negative integral solutions of the equation $x_1 + x_2 + x_3 + x_4 + x_5 = 12$ is

$= C(5 - 1 + 12, 12)$

($\because$ The number of non-negative integral solutions of $x_1 + x_2 + ... + x_k = s$ is $C(k - 1 + s, s)$)

$= C(16, 12)$

$= {}^{16}C_{12} = 1{,}820$ Ans: 1,820

18. Need matrix:

Process	need
P_1	2
P_2	1
P_3	6
P_4	5
P_5	5

Resources required to be available is 1. Ans : 1

19. Counting semaphore value = 25

33 down operations results semaphore value to be 25-33 = −8. and 40 UP operations results semaphore value to be –8 + 40 = 32 Ans : 32

20. Choice (B)

21. No. of possible permutations that can be obtained with 'n' numbers with 1, 2, 3, ... n (in that order) using stack is

$\frac{2^n C_n}{n+1} = \frac{^{10}C_5}{5+1} = 42 = 42$ Ans: 42

22. The maximum number of elements in a heap of height h is $2^{h+1} - 1$

Here $h = 10$,

So number of elements $= 2^{10+1} - 1$

$= 2048 - 1 = 2047$ Ans: 2047

23. PC uses 8-bits to access BHT.

$\Rightarrow$ There will be 2^8 entries. Each entry requires 8-bits for storing history. (for 8 branches)

$\therefore$ Total bits required for BHT $= 8 \times 2^8 = 2048$ bits.

Ans: 2048

24. Cache is 4-way set-associative. i.e., each set has 4 blocks.

Given byte offset is 4-bits, so block size $= 2^4$ bytes.

5-bits required for set index, so the number of sets in cache $= 2^5$

$\therefore$ Data portion in cache = number of sets × lines in set × line size

$= 2^5 \times 4 \times 2^4 = 2048$ Bytes Ans: 2048

25. Given regular expression accepts the strings in which every 0 that is not last symbol is immediately followed by a 1 and every 1 that is not last symbol is immediately followed by a 0.

The strings accepted are

$\{\varepsilon, 1, 0, 01, 10, 0101, ...\}$ Choice (B)

26. Regular and Recursive languages are closed under union, intersection and complementation CFL is not closed under intersection, complement.

Recursively enumerable languages are not closed under complementation. Choice (B)

27. Given 8 stations,

	Bit time 0	1	2	3	4
1 0 1 0 1	1	0	-	-	-
0 1 1 0 0	0	-	-	-	-
1 1 1 0 1	1	1	1	0	1
0 0 0 1 0	0	-	-	-	-
0 0 1 0 1	0	0	-	-	-
0 1 0 1 0	0	-	-	-	-
1 1 1 0 0	1	1	1	0	0
1 0 0 1 1	1	0	-	-	-
Result	1	1	1	0	1

3^{rd} station will transmit data first. (Higher numbered station has higher priority). Ans: 3

28. Given p = 7, $q = 11$

$\Rightarrow \quad z = (p-1) * (q-1) = 6 * 10 = 60$

Based on RSA,

$(e * d) \bmod z = 1$

if $e = 108 \quad \Rightarrow (108 * 7)\% \ 60 \neq 1$

if $e = 170 \quad \Rightarrow (170 * 7)\% \ 60 \neq 1$

if $e = 43 \quad \Rightarrow (43 * 7)\% \ 60 = 1$

$\therefore$ valid e value is 43. Choice (C)

29. Radix sort:

It will sort the keys, based on the digits in a key. Choice (A)

30. Both the given statements are TRUE about Weak Entity. Choice (D)

31. Assume a very large value for 'n', then the sequence will be $\log(\log n) \leq \log(\log n^2) \leq \log(\log_2 n!) \leq \log_2(n!)$ Choice (B)

32. π-eliminates duplicates from the result, Cartesian product is represented with (,) operator in SQL. Choice (C)

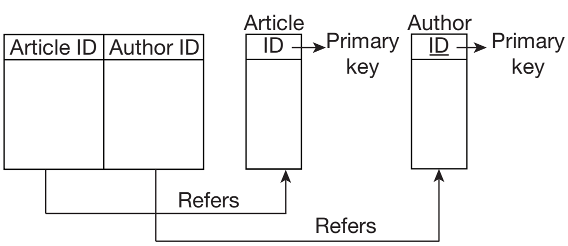
33. Given circuit is a ripple counter, $\bar{Q}_0$ is connected to rising edge Clk pulse, so it is UP counter.

Clk	Q_1	Q_0
0	0	0
1	0	1
2	1	0
3	1	1
4	0	0

Choice (A)

34. Table:

Authoring



—table that does not affect other tables, because the Authoring table is not referred by any table.

—If any deletion is performed in tables, Article and Author, that will affect the contents of Authoring table, because Authoring table refers to both the tables Author and Article.

I. TRUE II. FALSE Choice (A)

35. The uniquely identified attributes are candidate keys, among available candidate keys one attribute can be chosen as primary key. Super key must contain atleast one candidate key along with other attributes option (C) has no candidate key. Choice (C)

36. Given system of linear equations is:

$$\left.\begin{aligned} 2x_1 + 3x_2 + 5x_3 + 7x_4 &= 0 \\ -2x_2 + ax_3 &= 0 \\ 3x_3 + 2x_4 &= 0 \\ 6x_2 + bx_4 &= 0 \end{aligned}\right\} \quad (1)$$

(1) can be written in matrix form as $AX = O$

$$\text{Where } A = \begin{bmatrix} 2 & 3 & 5 & 7 \\ 0 & -2 & a & 0 \\ 0 & 0 & 3 & 2 \\ 0 & 6 & 0 & b \end{bmatrix};\ X = \begin{bmatrix} x_1 \\ x_2 \\ x_3 \\ x_4 \end{bmatrix} \text{ and } O = \begin{bmatrix} 0 \\ 0 \\ 0 \\ 0 \end{bmatrix}$$

Given that (1) has a non-trivial solution

$\Rightarrow \quad \text{Det}(A) = 0$

$$\Rightarrow \begin{vmatrix} 2 & 3 & 5 & 7 \\ 0 & -2 & a & 0 \\ 0 & 0 & 3 & 2 \\ 0 & 6 & 0 & b \end{vmatrix} = 0$$

$$\Rightarrow \quad 2\begin{vmatrix} -2 & a & 0 \\ 0 & 3 & 2 \\ 6 & 0 & b \end{vmatrix} = 0$$

$$\Rightarrow \quad 2\left(-2\begin{vmatrix} 3 & 2 \\ 0 & b \end{vmatrix} + 6\begin{vmatrix} a & 0 \\ 3 & 2 \end{vmatrix}\right) = 0$$

$\Rightarrow \quad 2(-6b + 12a) = 0$

$\Rightarrow \quad 2a - b = 0.$ Choice (D)

37. Let $f(x) = (1-x)^{5/2}$

The coefficient of x^3 in the Maclaurin's series expansion of $f(x) = \dfrac{f'''(0)}{3!}$

$$f(x) = (1-x)^{5/2} \quad \Rightarrow \quad f'(x) = \frac{-5}{2}(1-x)^{3/2}$$

$$\Rightarrow \quad f''(x) = \frac{5}{2} \times \frac{3}{2}(1-x)^{1/2} \text{ and}$$

$$f'''(x) = \frac{-5}{2} \times \frac{3}{2} \times \frac{1}{2}(1-x)^{-\frac{1}{2}}$$

$$\therefore f'''(0) = \frac{-15}{8}$$

The coefficient of x^3 in the Maclaurin's series expansion of $(1-x)^{5/2} = \dfrac{\left(\dfrac{-15}{8}\right)}{3!} = \dfrac{-5}{16} = -0.3125$

Ans: –0.32 to –0.31

38. Given that X and Y denote the numbers shown up on the die in the first roll and the second roll respectively

$\therefore \quad P(X+Y=6/X-Y=2)$

$$= \frac{P[(X+Y=6)\cap(X-Y=2)]}{P(X-Y=2)}$$

$$= \frac{P(X=4, Y=2)}{P\left[\begin{array}{l}(X=3,Y=1)\cup(X=4,Y=2)\cup\\ (X=5,Y=3)\cup(X=6,Y=4)\end{array}\right]}$$

$$= \frac{P(X=4,Y=2)}{\begin{array}{l}P(X=3,Y=1)+P(X=4,Y=2)\\ +P(X=5,Y=3)+P(X=6,Y=4)\end{array}}$$

$$= \frac{P(X=4)\,P(Y=2)}{\begin{array}{l}P(X=3)\,P(Y=1)+P(X=4)\,P(Y=2)\\ +P(X=5)\,P(Y=3)+P(X=6)P(Y=4)\end{array}}$$

(QX and Y are independent random variables)

$$= \frac{\frac{1}{6}\times\frac{1}{6}}{\frac{1}{6}\times\frac{1}{6}+\frac{1}{6}\times\frac{1}{6}+\frac{1}{6}\times\frac{1}{6}+\frac{1}{6}\times\frac{1}{6}} = \frac{1}{4}.$$ Choice (B)

39. Given relation is $R = \{(x, y)/x, y \in Z^+$ and 'xy' is a perfect square$\}$

For any $a \in Z^+$, $a.\,a = a^2$ is a perfect square

$\therefore \quad (a, a) \in R, \forall\, a \in Z^+$

$\therefore \quad R$ is reflexive (1)

Consider $(a, b) \in R$

$\Rightarrow \quad a\,b$ is a perfect square

$\Rightarrow \quad b\,a$ is also a perfect square

$\Rightarrow \quad (b, a) \in R$

$\therefore \quad R$ is symmetric (2)

Let $(a, b) \in R$ and $(b, c) \in R$

$\Rightarrow \quad a\,b$ is a perfect square and $b\,c$ is a perfect square

Let a $b = k^2$ for some $k \in Z^+$ and $bc = l^2$ for some $l \in Z^+$

$$ab = k^2 \Rightarrow a = \frac{k^2}{b} \text{ and } bc = l^2 \Rightarrow c = \frac{l^2}{b}$$

$$\text{Consider } ac = \left(\frac{k^2}{b}\right)\left(\frac{l^2}{b}\right) = \frac{k^2 l^2}{b^2}$$

$$\therefore \quad ac = \left(\frac{kl}{b}\right)^2$$

$\Rightarrow \quad ac$ is also a perfect square

$\Rightarrow \quad (a, c) \in R$

$\therefore \quad R$ is transitive (3)

Hence from (1), (2) and (3), R is an equivalence relation

$\therefore \quad$ (I) is TRUE

Consider $(2, 18) \in R$

Clearly, $(18, 2) \in R$

But $2 \neq 18$

$\therefore \quad R$ is NOT anti-symmetric

Hence R is NOT a partial ordered relation

$\therefore \quad$ (II) is NOT TRUE

$\therefore \quad$ Only (I) is TRUE. Choice (A)

40. Let $F(p, q, r) \Leftrightarrow p \to (\rceil q \to r)$ (1)

$\Leftrightarrow \rceil p \vee (\rceil(\rceil q) \vee r)$

$(\because A \to B \Leftrightarrow \rceil A \vee B)$

$\Leftrightarrow \rceil p \vee q \vee r\ (\because \rceil(\rceil A) \Leftrightarrow A)$

The dual of $F(p, q, r)$ is $\rceil p \wedge q \wedge r$. Choice (C)

41. $X = \overline{P \cdot Q}$ $(\because G_1$ is NAND gate)

$= \oplus m\,(0, 1, 3, 5, 6, 8, 9, 13, 14, 15)$

$P.Q = \oplus m\,(2, 4, 7, 10, 11, 12)$

$Y = Q \cdot R = \oplus m\,(0, 2, 5, 10, 13)$ $(\because G_2$ is AND gate)

From above two equations, $Q = \oplus m\,(0, 2, 4, 5, 7, 10, 11, 12, 13)$

AB \ CD	00	01	11	10
00	1			1
01	1	1	1	
11	1	1		
10			1	1

$\therefore \quad Q = \bar{A}\bar{B}\bar{D} + \bar{A}BD + A\bar{B}C + B\bar{C}$ Choice (D)

42. Here $J_1 = K_1 = \bar{Q}_0,\ J_0 = Q_1, K_0 = 1$

If JK flipflop has to be replaced with D flip flop then

$D = J\,K$ characteristic equation $= J\bar{Q} + \bar{K}Q$

So, $D_1 = J_1\bar{Q}_1 + \bar{K}_1 Q_1$

But here $J_1 = \bar{Q}_0, K_1 = \bar{Q}_0$ (as per connections given)

$D_1 = \bar{Q}_0 \cdot \bar{Q}_1 + \bar{\bar{Q}}_0 Q_1 = \bar{Q}_0\bar{Q}_1 + Q_0 Q_1 = Q_0 \odot Q_1$

Similarly $D_0 = J_0\bar{Q}_0 + \bar{K}_0 Q_0$

$J_0 = Q_1, K_0 = 1$

So $\quad D_0 = Q_1 \cdot \bar{Q}_0 + 0 \cdot Q_0$

$D_0 = Q_1\,\bar{Q}_0$

(or) Find the sequence of given counter, and design the same sequence counter with D-flip flops. Choice (B)

43. Given, Block size = 16 words

Main memory size = 64 Blocks

Cache size = 8 Blocks

Main memory size = 64 × 16 words = 2^{10} words

In direct mapped system,

Tag	Line	Word

10-bits

10-bits

Word field size = 4

Line field size = 3 $(\because$ 8 blocks in cache)

$\Rightarrow \quad$ Tag = 3 bits

(i) 37A: 0011 0 | 111|1010

Line 7 but Tag mis-match

$\Rightarrow$ (i) is a miss

(ii) 22C:0010 0 | 010 | 1100

Line 2 and Tag matched

$\Rightarrow$ (ii) is a Hit

(iii) 00C:0000 0 | 000 | 1100

Line 0 and Tag matched

$\Rightarrow$ (iii) is a Hit.

(iv) $(1B9)_{16}$: 0001 1 | 011 | 1001

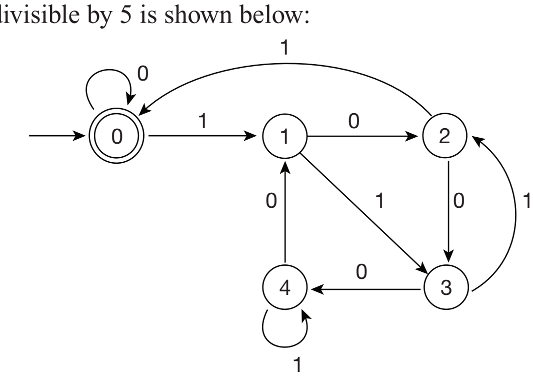
Line 3 but tag mis-match

$\Rightarrow$ (iv) is a miss. Choice (D)

44. (i) assumes, given bit pattern represents a 2's complement integer.
For a 2's complement number, if the MSB is 1, take 2's complement to the magnitude to get correct binary number and then convert to decimal.
1|010 1101 0001 0000 0000 0000 0000 0000
$\Downarrow$ 1's complement
101 0010 1110 1111 1111 1111 1111 1111
$\Downarrow$ 2's complement
101 0010 1111 0000 0000 0000 0000 0000
$\Downarrow$ Decimal
– 1391460352
$\therefore$ (i) is correct
(ii) assumes that given bit pattern represents an unsigned integer. To get its decimal equivalent all the bits in the given number are considered.
1010 1101 0001 0000 0000 0000 0000 0000
$\Downarrow$ Decimal
2903506944
$\therefore$ (ii) is incorrect.
(iii) assumes that given bit pattern represents a single precision floating point number.
1 | 010 1101 0 | 001 0000 0000 0000 0000 0000
Sign = –
Exponent = Biased exponent –127
= 90 – 127 = –37
Mantissa = 1.001
$\therefore$ Given number is equivalent to $(-1.001) \times 2^{-37}$
$= -8.185 \times 10^{-12}$
$\therefore$ (iii) is correct Choice (B)

45. Conflict misses can be reduced by increasing set-associativity. Compulsory misses will not be reduced by increasing the size of cache without increasing block size. Smaller caches have shorter hit time than larger cache. By increasing associativity of a cache the hit time also increases as the Tag bits need to be compared with all the blocks of the set. Choice (C)

46. The DFA which accepts the binary strings ω such that when you reverse ω, the resultant binary integer is divisible by 5 is shown below:



This accepts the strings,
{101, 0101, 1111, 00101, 10011, ...}
It has $x = 5$ states and $y = 2$ self loops.
$\therefore x * y = 5 * 2 = 10$ Ans: 10

47. L_1 is described by 1* (0111*)*
L_3 is the finite automata for the language L_1.
L_1 is not subset of L_4. L_1 has all 1's which is not accepted by L_4.
L_4 has one zero and two 1's. L_2 has atleast one 0 and atleast two 1's. So $L_4 \subset L_2$. Choice (B)

48. PCP is an undecidable problem. Choice (A)

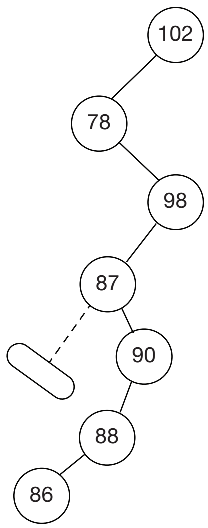
49. Size of data field in each fragment = 680 Bytes
(20 Bytes is for header)
Number of fragments required $= \left\lceil \frac{2500 - 20}{680} \right\rceil = 4$
Each fragment will have an identification number of 422.
The offsets of the 4 fragments will be 0, $\frac{680}{8} = 85, \frac{1360}{8} = 170, \frac{2040}{8} = 255.$
(The fragmentation offset is a multiple of 8 Bytes).
Choice (C)

50. Delay for each datagram is (time taken to reach destination + delays at visited switches).
For Datagram 1,
arrival time $= \frac{3000 \text{ km}}{2 \times 10^8} = 15$ m sec
Delay at switches 1, 3, 5 is
2 + 23 + 18 = 43 msec
$\therefore$ Delay for Datagram 1 is 15 + 43 = 58 msec
Delay for Datagram 2 is
$\frac{10,800 \times 10^3}{2 \times 10^8}$ + (2 + 9 + 18) msec
= 83 m sec
Delay for Datagram 3 is
$\frac{13000 \times 10^3}{2 \times 10^8}$ + (1 + 9 + 23 + 18)
= 65 m sec + 51 m sec
= 116 m sec
Delay for Datagram 4 is
$\frac{10000 \times 10^3}{2 \times 10^8}$ + (2 + 7 + 18)
= 50 m sec + 27 m sec = 77 m sec Choice (B)

51. Given IPv4 multicast address is 232.48.60.9.
Its binary equivalent is
1110 1000.00110000.00111100.00001001
First 4-bits represents, multicasting.
Remaining 28-bits gives the group ID.
48-bit Ethernet address for given multicast IPv4 address has the range
01:00:5*E*:00:00:00 – 01:00:5*E*:7*F*:*FF*:*FF*
In which last 23-bits are replaced with low 23-bits of the multicast IPv4 address.
Last 23-bits of given address are
011 0000.0011 1100.0000 1001
$\therefore$ Required 48-bit address is
01:00:5*E*:0011 0000:0011 1100:0000 1001
01:00:5*E*:30:3*C*:09 Choice (D)

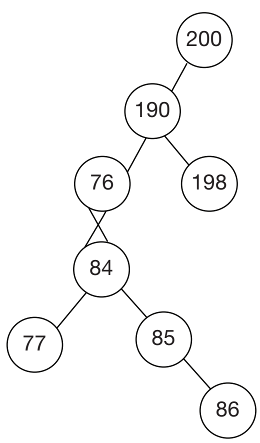
52. Quick Sort Algorithm gives worst case (maximum comparisons). Time Complexity is ($O(n^2)$) if the elements are already in ascending order.
Both (i) and (ii) are in ascending order.
$\therefore A_1 = A_2$ Choice (C)

53. **I.**



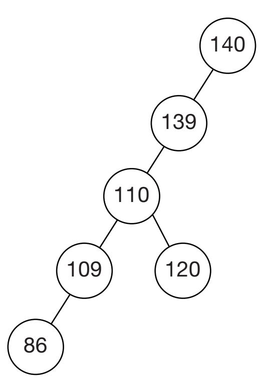
The search should have taken left path from element (87).

II.



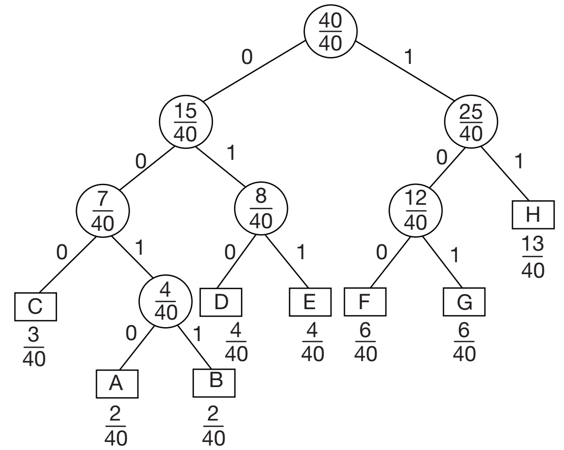
The search should be continuous (It should not change the paths).

III.



$\therefore$ Search is not continuous.
$\therefore$ Correct search Choice (D)

54. **Huffman-coding:**



Codes:
$A = 0010$ (4-bits)
$B = 0011$ (4-bits)
$C = 000$ (3-bits)
$D = 010$ (3-bits)
$E = 011$ (3-bits)
$F = 100$ (3-bits)
$G = 101$ (3-bits)
$H = 11$ (2-bits)
The average Huffman code size in bits per symbol is

$$\frac{2}{40}\times 4 + \frac{2}{40}\times 4 + \frac{3}{40}\times 3 + \frac{4}{40}\times 3 + \frac{4}{40}\times 3 + \frac{6}{40}\times 3 + \frac{6}{40}\times 3 + \frac{13}{40}\times 2$$

$$= \frac{8}{40} + \frac{8}{40} + \frac{9}{40} + \frac{12}{40} + \frac{12}{40} + \frac{18}{40} + \frac{18}{40} + \frac{26}{40}$$

$$= \frac{111}{40}$$

Choice (C)

55. From the data, The functional dependencies are
Borrower-id $\rightarrow$ name, address ($B \rightarrow NA$)
Borrower-id, request-date $\rightarrow$ loan-amount ($BR \rightarrow L$)
key:

L	M	R
BR		NAL

$BR^+ = \{BRNAL\}$
key = Borrower - Id, request - date Choice (B)

56. Lets assume some data.
Loan-payment B

Customer-Id	Repayment amount	Request date
C_1	1000	23/1/15
C_2	2000	28/2/15
C_3	4000	20/3/15
C_4	6000	19/1/15

C_1	2000	6/7/15
C_2	2000	8/8/15

Loan A

Customer-Id	Request date	Loan-amount
C_1	23/1/15	3000
C_2	28/2/15	4000
C_3	20/3/15	8000
C_4	19/1/15	7000

Sub query result:
Sum (repayment-amount)

C_1	3000
C_2	4000
C_3	4000
C_4	6000

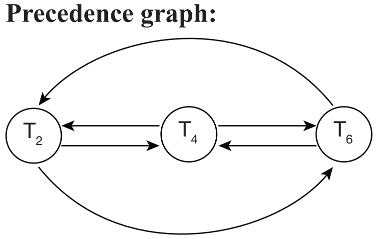
Loan amount = (select sum (repayment-amount))
C_1 3000 = C_1 3000
C_2 4000 = C_2 4000
C_3 8000 ≠ C_3 4000
C_4 7000 ≠ C_4 6000
For customers C_1, C_2 the repayment of loan is ended.
Choice (B)

57. Choice (B)

58.

	T_2	T_4	T_6
1		R(Q)	
2	W(Q)		
3			W(Q)
4		R(Q)	
5	W(Q)		
6		W(Q)	

Precedence graph:

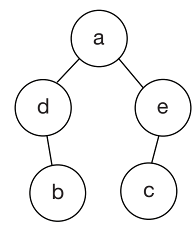


Conflicts
$T_4 \to T_2$ (1 to 2)
$T_2 \to T_6$ (2 to 3)
$T_4 \to T_6$ (1 to 3)
$T_6 \to T_4$ (3 to 4)
$T_2 \to T_4$ (2 to 4)
$T_6 \to T_2$ (3 to 5) Choice (C)

59. Nesting depth is calculated as follows
(1) The nesting depth of main program is 1.
(2) Add 1 to depth each time when a new procedure begins.
(3) Subtract 1 from depth each time when you exit from a nested procedure. Choice (C)

60. Choice (A)

61.



From this, $d < b < a < c < e$. Choice (A)

62. It prints 15 times Ans : 15

63.

P_1	P_2	P_3	P_1	P_4	P_2	P_3	P_4	P_2	P_3	P_4	P_2

Ready Queue: P_1, P_2, P_3, P_1, P_4, P_2, P_3, P_4, P_2, P_3, P_4, P_2, P_4 Ans: 11

64. The infix expression for the given postfix expression is
$a + b * c/d - e \wedge f \wedge g$
^ has high precedence (associated from Right to left).
+ / has least precedence. Choice (D)

65. Page size is 1 MB so requires 20 bits.
$d = 20$ $f + d = 30$
$p + d = 64$ $f = 30 - 20$
$p = 64 - 20$ $f = 10$
$p = 44$
page table size
$= 2^{44} \times 10$
$= 5 \times 2^{45}$
= 160 Tb
Ans : 160

PART - V

↳ Previous Year Paper
GATE CS/IT 2022 - 2007

GATE 2022 General Aptitude (GA)

Q.1 – Q.5 Carry ONE mark each.

Q.1	The __________ is too high for it to be considered __________.
(A)	fair / fare
(B)	faer / fair
(C)	fare / fare
(D)	fare / fair

Q.2	A function $y(x)$ is defined in the interval $[0, 1]$ on the x-axis as $$y(x) = \begin{cases} 2 & \text{if } 0 \le x < \frac{1}{3} \\ 3 & \text{if } \frac{1}{3} \le x < \frac{3}{4} \\ 1 & \text{if } \frac{3}{4} \le x \le 1 \end{cases}$$ Which one of the following is the area under the curve for the interval $[0, 1]$ on the x-axis?
(A)	$\frac{5}{6}$
(B)	$\frac{6}{5}$
(C)	$\frac{13}{6}$
(D)	$\frac{6}{13}$

Q.3	Let r be a root of the equation $x^2 + 2x + 6 = 0$. Then the value of the expression $(r+2)(r+3)(r+4)(r+5)$ is
(A)	51
(B)	-51
(C)	126
(D)	-126

Q.4	Given below are four statements. Statement 1: All students are inquisitive. Statement 2: Some students are inquisitive. Statement 3: No student is inquisitive. Statement 4: Some students are not inquisitive. From the given four statements, find the two statements that **CANNOT BE TRUE** simultaneously, assuming that there is at least one student in the class.
(A)	Statement 1 and Statement 3
(B)	Statement 1 and Statement 2
(C)	Statement 2 and Statement 4
(D)	Statement 3 and Statement 4

Q.5	A palindrome is a word that reads the same forwards and backwards. In a game of words, a player has the following two plates painted with letters.  From the additional plates given in the options, which one of the combinations of additional plates would allow the player to construct a five-letter palindrome. The player should use all the five plates exactly once. The plates can be rotated in their plane.
(A)	(B)	
(C)	
(D)	

Q. 6 – Q. 10 Carry TWO marks each.

Q.6	Some people believe that "what gets measured, improves". Some others believe that "what gets measured, gets gamed". One possible reason for the difference in the beliefs is the work culture in organizations. In organizations with good work culture, metrics help improve outcomes. However, the same metrics are counterproductive in organizations with poor work culture. Which one of the following is the CORRECT logical inference based on the information in the above passage?
(A)	Metrics are useful in organizations with poor work culture
(B)	Metrics are useful in organizations with good work culture
(C)	Metrics are always counterproductive in organizations with good work culture
(D)	Metrics are never useful in organizations with good work culture

Q.7	In a recently conducted national entrance test, boys constituted 65% of those who appeared for the test. Girls constituted the remaining candidates and they accounted for 60% of the qualified candidates. Which one of the following is the correct logical inference based on the information provided in the above passage?
(A)	Equal number of boys and girls qualified
(B)	Equal number of boys and girls appeared for the test
(C)	The number of boys who appeared for the test is less than the number of girls who appeared
(D)	The number of boys who qualified the test is less than the number of girls who qualified

Q.8	A box contains five balls of same size and shape. Three of them are green coloured balls and two of them are orange coloured balls. Balls are drawn from the box one at a time. If a green ball is drawn, it is not replaced. If an orange ball is drawn, it is replaced with another orange ball. First ball is drawn. What is the probability of getting an orange ball in the next draw?
(A)	$\frac{1}{2}$
(B)	$\frac{8}{25}$
(C)	$\frac{19}{50}$
(D)	$\frac{23}{50}$

Q.9	The corners and mid-points of the sides of a triangle are named using the distinct letters P, Q, R, S, T and U, but not necessarily in the same order. Consider the following statements: • The line joining P and R is parallel to the line joining Q and S. • P is placed on the side opposite to the corner T. • S and U cannot be placed on the same side. Which one of the following statements is correct based on the above information?
(A)	P cannot be placed at a corner
(B)	S cannot be placed at a corner
(C)	U cannot be placed at a mid-point
(D)	R cannot be placed at a corner

Q.10	A plot of land must be divided between four families. They want their individual plots to be similar in shape, not necessarily equal in area. The land has equally spaced poles, marked as dots in the below figure. Two ropes, R1 and R2, are already present and cannot be moved. What is the least number of **additional** straight ropes needed to create the desired plots? A single rope can pass through three poles that are aligned in a straight line. (A)	2
(B)	4
(C)	5
(D)	3

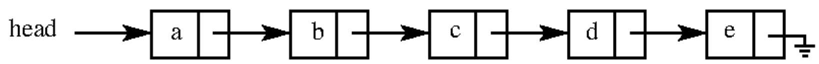
Q.11 – Q.22 Multiple Choice Questions (MCQ), carry ONE mark each.

Q.11	Which one of the following statements is TRUE for all positive functions $f(n)$?
(A)	$f(n^2) = \theta(f(n)^2)$, when $f(n)$ is a polynomial
(B)	$f(n^2) = o(f(n)^2)$
(C)	$f(n^2) = O(f(n)^2)$, when $f(n)$ is an exponential function
(D)	$f(n^2) = \Omega(f(n)^2)$
Q.12	Which one of the following regular expressions correctly represents the language of the finite automaton given below?
	(A)	$ab^*bab^* + ba^*aba^*$
(B)	$(ab^*b)^*ab^* + (ba^*a)^*ba^*$
(C)	$(ab^*b + ba^*a)^*(a^* + b^*)$
(D)	$(ba^*a + ab^*b)^*(ab^* + ba^*)$

Q.13	Which one of the following statements is TRUE?
(A)	The $LALR(1)$ parser for a grammar G cannot have reduce-reduce conflict if the $LR(1)$ parser for G does not have reduce-reduce conflict.
(B)	Symbol table is accessed only during the lexical analysis phase.
(C)	Data flow analysis is necessary for run-time memory management.
(D)	$LR(1)$ parsing is sufficient for deterministic context-free languages.
Q.14	In a relational data model, which one of the following statements is TRUE?
(A)	A relation with only two attributes is always in BCNF.
(B)	If all attributes of a relation are prime attributes, then the relation is in BCNF.
(C)	Every relation has at least one non-prime attribute.
(D)	BCNF decompositions preserve functional dependencies.

GATE 2022 Computer Science and Information Technology (CS)

Q.15 Consider the problem of reversing a singly linked list. To take an example, given the linked list below,



the reversed linked list should look like

Which one of the following statements is TRUE about the time complexity of algorithms that solve the above problem in $O(1)$ space?

(A) The best algorithm for the problem takes $\theta(n)$ time in the worst case.

(B) The best algorithm for the problem takes $\theta(n \log n)$ time in the worst case.

(C) The best algorithm for the problem takes $\theta(n^2)$ time in the worst case.

(D) It is not possible to reverse a singly linked list in $O(1)$ space.

Q.16 Suppose we are given n keys, m hash table slots, and two simple uniform hash functions h_1 and h_2. Further suppose our hashing scheme uses h_1 for the odd keys and h_2 for the even keys. What is the expected number of keys in a slot?

(A) $\frac{m}{n}$

(B) $\frac{n}{m}$

(C) $\frac{2n}{m}$

(D) $\frac{n}{2m}$

Q.17	Which one of the following facilitates transfer of bulk data from hard disk to main memory with the highest throughput?
(A)	DMA based I/O transfer
(B)	Interrupt driven I/O transfer
(C)	Polling based I/O transfer
(D)	Programmed I/O transfer
Q.18	Let R1 and R2 be two 4-bit registers that store numbers in 2's complement form. For the operation R1+R2, which one of the following values of R1 and R2 gives an arithmetic overflow?
(A)	R1 = 1011 and R2 = 1110
(B)	R1 = 1100 and R2 = 1010
(C)	R1 = 0011 and R2 = 0100
(D)	R1 = 1001 and R2 = 1111

Q.19 Consider the following threads, T_1, T_2, and T_3 executing on a single processor, synchronized using three binary semaphore variables, S_1, S_2, and S_3, operated upon using standard `wait()` and `signal()`. The threads can be context switched in any order and at any time.

T1	T2	T3

`while(true){`
`wait(S3);`
`print("C");`
`signal(S2); }`
	`while(true){`
	`wait(S1);`
	`print("B");`
	`signal(S3); }`
		`while(true){`
		`wait(S2);`
		`print("A");`
		`signal(S1); }`

Which initialization of the semaphores would print the sequence `BCABCABCA`….?

(A) $S_1 = 1; S_2 = 1; S_3 = 1$

(B) $S_1 = 1; S_2 = 1; S_3 = 0$

(C) $S_1 = 1; S_2 = 0; S_3 = 0$

(D) $S_1 = 0; S_2 = 1; S_3 = 1$

Q.20	Consider the following two statements with respect to the matrices $A_{m\times n}$, $B_{n\times m}$, $C_{n\times n}$ and $D_{n\times n}$. Statement 1: $tr(AB) = tr(BA)$ Statement 2: $tr(CD) = tr(DC)$ where $tr()$ represents the trace of a matrix. Which one of the following holds?
(A)	Statement 1 is correct and Statement 2 is wrong.
(B)	Statement 1 is wrong and Statement 2 is correct.
(C)	Both Statement 1 and Statement 2 are correct.
(D)	Both Statement 1 and Statement 2 are wrong.

Q.21	What is printed by the following ANSI C program?
	`#include<stdio.h>`
	`int main(int argc, char *argv[])`
	`{`
	`    int x = 1, z[2] = {10, 11};`
	`    int *p = NULL;`
	`    p = &x;`
	`    *p = 10;`
	`    p = &z[1];`
	`    *(&z[0] + 1) += 3;`
	`    printf("%d, %d, %d\n", x, z[0], z[1]);`
	`    return 0;`
	`}`

(A)	1, 10, 11
(B)	1, 10, 14
(C)	10, 14, 11
(D)	10, 10, 14

Q.22	Consider an enterprise network with two Ethernet segments, a web server and a firewall, connected via three routers as shown below.
	 What is the number of subnets inside the enterprise network?
(A)	3
(B)	12
(C)	6
(D)	8

Q.23 – Q.27 Multiple Select Questions (MSQ), carry ONE mark each.

Q.23	Which of the following statements is/are TRUE?
(A)	Every subset of a recursively enumerable language is recursive.
(B)	If a language L and its complement $\overline{L}$ are both recursively enumerable, then L must be recursive.
(C)	Complement of a context-free language must be recursive.
(D)	If L_1 and L_2 are regular, then $L_1 \cap L_2$ must be deterministic context-free.
Q.24	Let WB and WT be two set associative cache organizations that use LRU algorithm for cache block replacement. WB is a write back cache and WT is a write through cache. Which of the following statements is/are FALSE?
(A)	Each cache block in WB and WT has a dirty bit.
(B)	Every write hit in WB leads to a data transfer from cache to main memory.
(C)	Eviction of a block from WT will not lead to data transfer from cache to main memory.
(D)	A read miss in WB will never lead to eviction of a dirty block from WB.

Q.25	Consider the following three relations in a relational database. $Employee(\underline{eId}, Name),\ Brand(\underline{bId}, bName),\ Own(\underline{eId}, \underline{bId})$ Which of the following relational algebra expressions return the set of *eId*s who own all the brands?
(A)	$\Pi_{eId}(\Pi_{eId,bId}(Own) / \Pi_{bId}(Brand))$
(B)	$\Pi_{eId}(Own) - \Pi_{eId}\left((\Pi_{eId}(Own) \times \Pi_{bId}(Brand)) - \Pi_{eId,bId}(Own)\right)$
(C)	$\Pi_{eId}(\Pi_{eId,bId}(Own) / \Pi_{bId}(Own))$
(D)	$\Pi_{eId}\left((\Pi_{eId}(Own) \times \Pi_{bId}(Own)) / \Pi_{bId}(Brand)\right)$
Q.26	Which of the following statements is/are TRUE with respect to deadlocks?
(A)	Circular wait is a necessary condition for the formation of deadlock.
(B)	In a system where each resource has more than one instance, a cycle in its wait-for graph indicates the presence of a deadlock.
(C)	If the current allocation of resources to processes leads the system to unsafe state, then deadlock will necessarily occur.
(D)	In the resource-allocation graph of a system, if every edge is an assignment edge, then the system is not in deadlock state.

GATE 2022 Computer Science and Information Technology (CS)

Q.27	Which of the following statements is/are TRUE for a group G ?
(A)	If for all $x, y \in G$, $(xy)^2 = x^2 y^2$, then G is commutative.
(B)	If for all $x \in G$, $x^2 = 1$, then G is commutative. Here, 1 is the identity element of G.
(C)	If the order of G is 2, then G is commutative.
(D)	If G is commutative, then a subgroup of G need not be commutative.

Q.28 – Q.35 Numerical Answer Type (NAT), carry ONE mark each.

Q.28	Suppose a binary search tree with 1000 distinct elements is also a complete binary tree. The tree is stored using the array representation of binary heap trees. Assuming that the array indices start with 0, the 3rd largest element of the tree is stored at index______________.
Q.29	Consider the augmented grammar with $\{+, *, (,), id\}$ as the set of terminals. $S' \rightarrow S$ $S \rightarrow S + R \mid R$ $R \rightarrow R * P \mid P$ $P \rightarrow (S) \mid id$ If I_0 is the set of two $LR(0)$ items $\{[S' \rightarrow S.], [S \rightarrow S. + R]\}$, then $goto(closure(I_0), +)$ contains exactly __________ items.
Q.30	Consider a simple undirected graph of 10 vertices. If the graph is disconnected, then the maximum number of edges it can have is _____________.
Q.31	Consider a relation $R(A, B, C, D, E)$ with the following three functional dependencies. $AB \rightarrow C;\ \ BC \rightarrow D;\ \ C \rightarrow E;$ The number of superkeys in the relation R is ______________.
Q.32	The number of arrangements of six identical balls in three identical bins is______.

Q.33	A cache memory that has a hit rate of 0.8 has an access latency 10 ns and miss penalty 100 ns. An optimization is done on the cache to reduce the miss rate. However, the optimization results in an increase of cache access latency to 15 ns, whereas the miss penalty is not affected. The minimum hit rate (*rounded off to two decimal places*) needed after the optimization such that it should not increase the average memory access time is _____________.
Q.34	The value of the following limit is _____________. $$\lim_{x \to 0+} \frac{\sqrt{x}}{1-e^{2\sqrt{x}}}$$
Q.35	Consider the resolution of the domain name `www.gate.org.in` by a DNS resolver. Assume that no resource records are cached anywhere across the DNS servers and that iterative query mechanism is used in the resolution. The number of DNS query-response pairs involved in completely resolving the domain name is_____________.

Q.36 – Q.45 Multiple Choice Questions (MCQ), carry TWO marks each.

Q.36	Which one of the following is the closed form for the generating function of the sequence $\{a_n\}_{n\geq 0}$ defined below? $$a_n = \begin{cases} n+1, & n \text{ is odd} \\ 1, & \text{otherwise} \end{cases}$$
(A)	$\frac{x(1+x^2)}{(1-x^2)^2}+\frac{1}{1-x}$
(B)	$\frac{x(3-x^2)}{(1-x^2)^2}+\frac{1}{1-x}$
(C)	$\frac{2x}{(1-x^2)^2}+\frac{1}{1-x}$
(D)	$\frac{x}{(1-x^2)^2}+\frac{1}{1-x}$
Q.37	Consider a simple undirected unweighted graph with at least three vertices. If A is the adjacency matrix of the graph, then the number of 3-cycles in the graph is given by the trace of
(A)	A^3
(B)	A^3 divided by 2
(C)	A^3 divided by 3
(D)	A^3 divided by 6

Q.38	Which one of the following statements is FALSE?
(A)	The TLB performs an associative search in parallel on all its valid entries using page number of incoming virtual address.
(B)	If the virtual address of a word given by CPU has a TLB hit, but the subsequent search for the word results in a cache miss, then the word will always be present in the main memory.
(C)	The memory access time using a given inverted page table is always same for all incoming virtual addresses.
(D)	In a system that uses hashed page tables, if two distinct virtual addresses V1 and V2 map to the same value while hashing, then the memory access time of these addresses will not be the same.
Q.39	Let $R_i(z)$ and $W_i(z)$ denote read and write operations on a data element z by a transaction T_i , respectively. Consider the schedule ***S*** with four transactions. ***S***: $R_4(x)R_2(x)R_3(x)R_1(y)W_1(y)W_2(x)W_3(y)R_4(y)$ Which one of the following serial schedules is conflict equivalent to ***S***?
(A)	$T_1 \rightarrow T_3 \rightarrow T_4 \rightarrow T_2$
(B)	$T_1 \rightarrow T_4 \rightarrow T_3 \rightarrow T_2$
(C)	$T_4 \rightarrow T_1 \rightarrow T_3 \rightarrow T_2$
(D)	$T_3 \rightarrow T_1 \rightarrow T_4 \rightarrow T_2$

Q.40	Consider a digital display system (DDS) shown in the figure that displays the contents of register X. A 16-bit code word is used to load a word in X, either from S or from R. S is a 1024-word memory segment and R is a 32-word register file. Based on the value of mode bit M, T selects an input word to load in X. P and Q interface with the corresponding bits in the code word to choose the addressed word. Which one of the following represents the functionality of P, Q, and T?
	(A)	P is 10:1 multiplexer; Q is 5:1 multiplexer; T is 2:1 multiplexer
(B)	P is 10:2^{10} decoder; Q is 5:2^{5} decoder; T is 2:1 encoder
(C)	P is 10:2^{10} decoder; Q is 5:2^{5} decoder; T is 2:1 multiplexer
(D)	P is 1:10 de-multiplexer; Q is 1:5 de-multiplexer; T is 2:1 multiplexer

Q.41	Consider three floating point numbers A, B and C stored in registers R_A, R_B and R_C, respectively as per IEEE-754 single precision floating point format. The 32-bit content stored in these registers (in hexadecimal form) are as follows. R_A= 0xC1400000 | R_B = 0x42100000 | R_C = 0x41400000 Which one of the following is FALSE?
(A)	$A+C=0$
(B)	$C=A+B$
(C)	$B=3C$
(D)	$(B-C)>0$
Q.42	Consider four processes P, Q, R, and S scheduled on a CPU as per round robin algorithm with a time quantum of 4 units. The processes arrive in the order P, Q, R, S, all at time t = 0. There is exactly one context switch from S to Q, exactly one context switch from R to Q, and exactly two context switches from Q to R. There is no context switch from S to P. Switching to a ready process after the termination of another process is also considered a context switch. Which one of the following is NOT possible as CPU burst time (in time units) of these processes?
(A)	P = 4, Q = 10, R = 6, S = 2
(B)	P = 2, Q = 9, R = 5, S = 1
(C)	P = 4, Q = 12, R = 5, S = 4
(D)	P = 3, Q = 7, R = 7, S = 3

Q.43	What is printed by the following ANSI C program?

```
#include<stdio.h>
int main(int argc, char *argv[])
{
          int a[3][3][3] =
          {{1, 2, 3, 4, 5, 6, 7, 8, 9},
           {10, 11, 12, 13, 14, 15, 16, 17, 18},
           {19, 20, 21, 22, 23, 24, 25, 26, 27}};
     int i = 0, j = 0, k = 0;
     for( i = 0; i < 3; i++ ){
          for(k = 0; k < 3; k++ )
               printf("%d ", a[i][j][k]);
          printf("\n");
     }
     return 0;
}
```

(A)
```
1 2 3
10 11 12
19 20 21
```

(B)
```
1 4 7
10 13 16
19 22 25
```

(C)
```
1 2 3
4 5 6
7 8 9
```

(D)
```
1 2 3
13 14 15
25 26 27
```

Q.44 What is printed by the following ANSI C program?

```
#include<stdio.h>
int main(int argc, char *argv[]){
    char a = 'P';
    char b = 'x';
    char c = (a & b) + '*';
    char d = (a | b) - '-';
    char e = (a ^ b) + '+';
    printf("%c %c %c\n", c, d, e);
    return 0;
}
```

ASCII encoding for relevant characters is given below

A	B	C	...	Z
65	66	67	...	90

a	b	c	...	z
97	98	99	...	122

*	+	–
42	43	45

(A) `z K S`

(B) `122 75 83`

(C) `* - +`

(D) `P x +`

Q.45	Consider solving the following system of simultaneous equations using LU decomposition. $$\begin{aligned} x_1 + x_2 - 2x_3 &= 4 \\ x_1 + 3x_2 - x_3 &= 7 \\ 2x_1 + x_2 - 5x_3 &= 7 \end{aligned}$$ where L and U are denoted as $$L = \begin{pmatrix} L_{11} & 0 & 0 \\ L_{21} & L_{22} & 0 \\ L_{31} & L_{32} & L_{33} \end{pmatrix}, \quad U = \begin{pmatrix} U_{11} & U_{12} & U_{13} \\ 0 & U_{22} & U_{23} \\ 0 & 0 & U_{33} \end{pmatrix}$$ Which one of the following is the correct combination of values for L_{32}, U_{33}, and x_1?
(A)	$L_{32} = 2,\ U_{33} = -\frac{1}{2},\ x_1 = -1$
(B)	$L_{32} = 2,\ U_{33} = 2,\ x_1 = -1$
(C)	$L_{32} = -\frac{1}{2},\ U_{33} = 2,\ x_1 = 0$
(D)	$L_{32} = -\frac{1}{2},\ U_{33} = -\frac{1}{2},\ x_1 = 0$

GATE 2022 Computer Science and Information Technology (CS)
Q.46 – Q.555 Multiple Select Questions (MSQ), carry TWO marks each.

Q.46	Which of the following is/are undecidable?
(A)	Given two Turing machines M_1 and M_2, decide if $L(M_1) = L(M_2)$.
(B)	Given a Turing machine M, decide if $L(M)$ is regular.
(C)	Given a Turing machine M, decide if M accepts all strings.
(D)	Given a Turing machine M, decide if M takes more than 1073 steps on every string.
Q.47	Consider the following languages: $L_1 = \{a^n w a^n \mid w \in \{a,b\}^*\}$ $L_2 = \{w x w^R \mid w, x \in \{a,b\}^*, \lvert w\rvert, \lvert x\rvert > 0\}$ Note that w^R is the reversal of the string w. Which of the following is/are TRUE?
(A)	L_1 and L_2 are regular.
(B)	L_1 and L_2 are context-free.
(C)	L_1 is regular and L_2 is context-free.
(D)	L_1 and L_2 are context-free but not regular.

Q.48	Consider the following languages: $L_1 = \{ww \mid w \in \{a,b\}^*\}$ $L_2 = \{a^n b^n c^m \mid m,n \geq 0\}$ $L_3 = \{a^m b^n c^n \mid m,n \geq 0\}$ Which of the following statements is/are FALSE?
(A)	L_1 is not context-free but L_2 and L_3 are deterministic context-free.
(B)	Neither L_1 nor L_2 is context-free.
(C)	L_2, L_3 and $L_2 \cap L_3$ all are context-free.
(D)	Neither L_1 nor its complement is context-free.
Q.49	Consider a simple undirected weighted graph G, all of whose edge weights are distinct. Which of the following statements about the minimum spanning trees of G is/are TRUE?
(A)	The edge with the second smallest weight is always part of any minimum spanning tree of G.
(B)	One or both of the edges with the third smallest and the fourth smallest weights are part of any minimum spanning tree of G.
(C)	Suppose $S \subseteq V$ be such that $S \neq \phi$ and $S \neq V$. Consider the edge with the minimum weight such that one of its vertices is in S and the other in $V \setminus S$. Such an edge will always be part of any minimum spanning tree of G.
(D)	G can have multiple minimum spanning trees.

Q.50	The following simple undirected graph is referred to as the Peterson graph.  Which of the following statements is/are TRUE?
(A)	The chromatic number of the graph is 3.
(B)	The graph has a Hamiltonian path.
(C)	The following graph is isomorphic to the Peterson graph. (D)	The size of the largest independent set of the given graph is 3. (A subset of vertices of a graph form an independent set if no two vertices of the subset are adjacent.)

Q.51	Consider the following recurrence: $$\begin{aligned} f(1) &= 1; \\ f(2n) &= 2f(n)-1, \quad \text{for } n \geq 1; \\ f(2n+1) &= 2f(n)+1, \quad \text{for } n \geq 1. \end{aligned}$$ Then, which of the following statements is/are TRUE?
(A)	$f(2^n - 1) = 2^n - 1$
(B)	$f(2^n) = 1$
(C)	$f(5 \cdot 2^n) = 2^{n+1} + 1$
(D)	$f(2^n + 1) = 2^n + 1$
Q.52	Which of the properties hold for the adjacency matrix A of a simple undirected unweighted graph having n vertices?
(A)	The diagonal entries of A^2 are the degrees of the vertices of the graph.
(B)	If the graph is connected, then none of the entries of $A^{n-1} + I_n$ can be zero.
(C)	If the sum of all the elements of A is at most $2(n-1)$, then the graph must be acyclic.
(D)	If there is at least a 1 in each of A's rows and columns, then the graph must be connected.

Q.53	Which of the following is/are the eigenvector(s) for the matrix given below? $$\begin{pmatrix} -9 & -6 & -2 & -4 \\ -8 & -6 & -3 & -1 \\ 20 & 15 & 8 & 5 \\ 32 & 21 & 7 & 12 \end{pmatrix}$$
(A)	$\begin{pmatrix} -1 \\ 1 \\ 0 \\ 1 \end{pmatrix}$
(B)	$\begin{pmatrix} 1 \\ 0 \\ -1 \\ 0 \end{pmatrix}$
(C)	$\begin{pmatrix} -1 \\ 0 \\ 2 \\ 2 \end{pmatrix}$
(D)	$\begin{pmatrix} 0 \\ 1 \\ -3 \\ 0 \end{pmatrix}$

Q.54	Consider a system with 2 KB direct mapped data cache with a block size of 64 bytes. The system has a physical address space of 64 KB and a word length of 16 bits. During the execution of a program, four data words P, Q, R, and S are accessed in that order 10 times (*i.e.,* PQRSPQRS…). Hence, there are 40 accesses to data cache altogether. Assume that the data cache is initially empty and no other data words are accessed by the program. The addresses of the first bytes of P, Q, R, and S are 0xA248, 0xC28A, 0xCA8A, and 0xA262, respectively. For the execution of the above program, which of the following statements is/are TRUE with respect to the data cache?
(A)	Every access to S is a hit.
(B)	Once P is brought to the cache it is never evicted.
(C)	At the end of the execution only R and S reside in the cache.
(D)	Every access to R evicts Q from the cache.

Q.55 Consider routing table of an organization's router shown below:

Subnet Number	Subnet Mask	Next Hop
12.20.164.0	255.255.252.0	R1
12.20.170.0	255.255.254.0	R2
12.20.168.0	255.255.254.0	Interface 0
12.20.166.0	255.255.254.0	Interface 1
default		R3

Which of the following prefixes in CIDR notation can be collectively used to correctly aggregate all of the subnets in the routing table?

(A) 12.20.164.0/20

(B) 12.20.164.0/22

(C) 12.20.164.0/21

(D) 12.20.168.0/22

Q.56 – Q.65 Numerical Answer Type (NAT), carry TWO marks each.

Q.56 Consider the relational database with the following four schemas and their respective instances.

`Student(sNo, sName, dNo)  Dept(dNo, dName)`

`Course(cNo, cName, dNo)  Register(sNo, cNo)`

Student

sNo	sName	dNo
S01	James	D01
S02	Rocky	D01
S03	Jackson	D02
S04	Jane	D01
S05	Milli	D02

Dept

dNo	dName
D01	CSE
D02	EEE

Course

cNo	cName	dNo
C11	DS	D01
C12	OS	D01
C21	DE	D02
C22	PT	D02
C23	CV	D03

Register

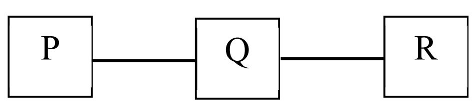
sNo	cNo
S01	C11
S01	C12
S02	C11
S03	C21
S03	C22
S03	C23
S04	C11
S04	C12
S05	C11
S05	C21

SQL Query:

```
SELECT * FROM Student AS S WHERE NOT EXIST
 (SELECT cNo FROM Course WHERE dNo = "D01"
     EXCEPT
  SELECT cNo FROM Register WHERE sNo = S.sNo)
```

The number of rows returned by the above SQL query is____________.

Q.57 Consider a network with three routers P, Q, R shown in the figure below. All the links have cost of unity.



The routers exchange distance vector routing information and have converged on the routing tables, after which the link Q−R fails. Assume that P and Q send out routing updates at random times, each at the same average rate. The probability of a routing loop formation (*rounded off to one decimal place*) between P and Q, leading to count-to-infinity problem, is____________.

Q.58	Let $G(V,E)$ be a directed graph, where $V = \{1,2,3,4,5\}$ is the set of vertices and E is the set of directed edges, as defined by the following adjacency matrix A. $$A[i][j] = \begin{cases} 1, & 1 \le j \le i \le 5 \\ 0, & otherwise \end{cases}$$ $A[i][j] = 1$ indicates a directed edge from node i to node j. A *directed spanning tree* of G, rooted at $r \in V$, is defined as a subgraph T of G such that the undirected version of T is a tree, and T contains a directed path from r to every other vertex in V. The number of such directed spanning trees rooted at vertex 5 is_____________.
Q.59	Consider a 100 Mbps link between an earth station (sender) and a satellite (receiver) at an altitude of 2100 km. The signal propagates at a speed of 3×10^8 m/s. The time taken (in milliseconds, *rounded off to two decimal places*) for the receiver to completely receive a packet of 1000 bytes transmitted by the sender is_________.
Q.60	Consider the data transfer using TCP over a 1 Gbps link. Assuming that the maximum segment lifetime (MSL) is set to 60 seconds, the minimum number of bits required for the sequence number field of the TCP header, to prevent the sequence number space from wrapping around during the MSL is____________.
Q.61	A processor X_1 operating at 2 GHz has a standard 5-stage RISC instruction pipeline having a base CPI (cycles per instruction) of one without any pipeline hazards. For a given program P that has 30% branch instructions, control hazards incur 2 cycles stall for every branch. A new version of the processor X_2 operating at same clock frequency has an additional branch predictor unit (BPU) that completely eliminates stalls for correctly predicted branches. There is neither any savings nor any additional stalls for wrong predictions. There are no structural hazards and data hazards for X_1 and X_2. If the BPU has a prediction accuracy of 80%, the speed up (*rounded off to two decimal places*) obtained by X_2 over X_1 in executing P is____________.

Q.62	Consider the queues Q_1 containing four elements and Q_2 containing none (shown as the Initial State in the figure). The only operations allowed on these two queues are `Enqueue(Q,element)` and `Dequeue(Q)`. The minimum number of `Enqueue` operations on Q_1 required to place the elements of Q_1 in Q_2 in reverse order (shown as the Final State in the figure) without using any additional storage is____________.
	Q.63	Consider two files systems A and B, that use contiguous allocation and linked allocation, respectively. A file of size 100 blocks is already stored in A and also in B. Now, consider inserting a new block in the middle of the file (between 50th and 51st block), whose data is already available in the memory. Assume that there are enough free blocks at the end of the file and that the file control blocks are already in memory. Let the number of disk accesses required to insert a block in the middle of the file in A and B are n_A and n_B, respectively, then the value of $n_A + n_B$ is__________.
Q.64	Consider a demand paging system with four page frames (initially empty) and LRU page replacement policy. For the following page reference string $$7,2,7,3,2,5,3,4,6,7,7,1,5,6,1$$ the page fault rate, defined as the ratio of number of page faults to the number of memory accesses (*rounded off to one decimal place*) is__________.

Q.65	Consider the following grammar along with translation rules. $S \rightarrow S_1 \# T \quad \{S_{\bullet val} = S_{1\bullet val} * T_{\bullet val}\}$ $S \rightarrow T \quad \{S_{\bullet val} = T_{\bullet val}\}$ $T \rightarrow T_1 \% R \quad \{T_{\bullet val} = T_{1\bullet val} \div R_{\bullet val}\}$ $T \rightarrow R \quad \{T_{\bullet val} = R_{\bullet val}\}$ $R \rightarrow id \quad \{R_{\bullet val} = id_{\bullet val}\}$ Here $\#$ and $\%$ are operators and *id* is a token that represents an integer and $id_{\bullet val}$ represents the corresponding integer value. The set of non-terminals is $\{S, T, R, P\}$ and a subscripted non-terminal indicates an instance of the non-terminal. Using this translation scheme, the computed value of $S_{\bullet val}$ for root of the parse tree for the expression $20\#10\%5\#8\%2\%2$ is _____________.

SECTION - A GENERAL APTITUDE

Q.1 Given below are two statements I and II and two conclusions I and II:

Statement:

I. All bacteria are microorganisms.

II. All pathogens are microorganisms.

Conclusions:

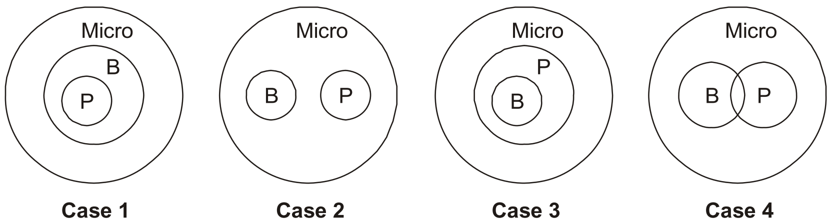
I. Some pathogens are bacteria.

II. All pathogens are not bacteria.

Based on the above statements and conclusions, which one of the following options is logically CORRECT?

(a) Only conclusion I is correct
(b) Either conclusion I or II is correct.
(c) Only conclusion II is correct
(d) Neither conclusion I nor II is correct.

Ans. (d)



None of the two conclusions will satisfy all the 4 cases.

End of Solution

Q.2 There are five bags each containing identical sets of ten distinct chocolates. One chocolate is picked from each bag.

The probability that at least two chocolates are identical is ________.

(a) 0.6976
(b) 0.3024
(c) 0.4235
(d) 0.8125

Ans. (a)

10 distinct chocolates, 5 bags

$$P(\text{atleast } 2) = 1 - P(\text{exactly } 1)$$

$$P(\text{exactly } 1) = P(\text{all different}) = \frac{10\times9\times8\times7\times6}{10^5}$$

$$P(\text{atleast } 2) = 1 - \frac{10\times9\times8\times7\times6}{10^5}$$

$$= 1 - 0.3024 = 0.6976$$

End of Solution

Q.3 
A circular sheet of paper is folded along the lines in the directions shown. The paper, after being punched in the filial folded state as shown and unfolded in the reverse order of folding, will look like ________.

(a) 
(b) 
(c) 
(d) 
Ans. (c)

End of Solution

Q.4 We have 2 rectangular sheets of paper, M and N, of dimensions 6 cm × 1 cm each. Sheet M is rolled to form an open cylinder by bringing the short edges of the sheet together. Sheet N is cut into equal square patches and assembled to form the largest possible closed cube. Assuming the ends of the cylinder are closed, the ratio of the volume of the cylinder to that of the cube is ________.

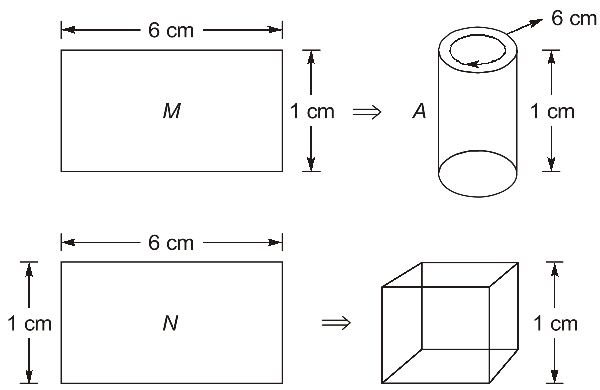
(a) $\frac{9}{\pi}$

(b) 3π

(c) $\frac{\pi}{2}$

(d) $\frac{3}{\pi}$

Ans. (a)



Volume of cylinder $= \pi r^2 h$

Now, $2\pi r = 6$ (figure A)

$$r = \frac{3}{\pi}$$

$$\text{Volume of cylinder} = \pi \times \frac{3}{\pi} \times \frac{3}{\pi} \times 1 = \frac{9}{\pi}$$

$$\text{Volume of cube} = (1)^3$$

$$\text{Ratio} = \frac{\frac{9}{\pi}}{1} = \frac{9}{\pi}$$

End of Solution

Q.5 Consider the following sentences:

(i) Everybody in the class is prepared for the exam.

(ii) Babu invited Danish to his home because he enjoys playing chess,

Which of the following is the CORRECT observation about the above two sentences?

(a) (i) is grammatically incorrect and (ii) is unambiguous

(b) (i) is grammatically correct and (ii) is ambiguous

(c) (i) is grammatically incorrect and (ii) is ambiguous

(d) (i) is grammatically correct and (ii) is unambiguous

Ans. (b)

Everybody is singular and takes singular verb is, first statement is correct and the purpose of invitation is unclear so second statement is vague and that sounds ambiguous.

End of Solution

Q.6 Some people suggest anti-obesity measures (AOM) such as displaying calorie information in restaurant menus. Such measures sidestep addressing the core problems that cause obesity: poverty and income inequality.

Which one of the following statements summarizes the passage?

(a) The proposed AOM addresses the care problems that cause obesity.

(b) If obesity reduces, poverty will naturally reduce, since obesity causes poverty.

(c) AOM are addressing the problem superficially.

(d) AOM are addressing the core problems and are likely to succeed.

Ans. (c)

Superficially is the deciding key word which means apparently/seemingly.

End of Solution

Q.7 ________ is to *surgery* as *writer* is to ________

Which one of the following options maintains a similar logical relation in the above sentence?

(a) Plan, outline
(b) Hospital, library
(c) Doctor, book
(d) Medicine, grammar

Ans. (c)

Doctor performs surgery as writer writes book.

End of Solution

Q.8 A polygon is convex if, for every pair of points. P and Q belonging to the polygon, the line segment PQ lies completely inside or on the polygon.
Which one of the following is NOT a convex polygon?

(a) 
(b) 
(c) 
(d) 
Ans. **(c)**

End of Solution

Q.9

Items	Cost (₹)	Profit%	Marked price (₹)
P	5400	–	5860
Q	–	25	10000

Details of prices of two items P and Q are presented in the above table. The ratio of cost of item P to cost of item Q is 3 : 4. Discount is calculated as the difference between the marked price and the selling price. The profit percentage is calculated as the ratio of the difference between selling price and cost, to the cost

$$\left(\text{Profit\%} = \frac{\text{Selling price} - \text{Cost}}{\text{Cost}} \times 100\right).$$

The discount on item Q, as a percentage of its marked price, is ________.

(a) 25 (b) 10

(c) 5 (d) 12.5

Ans. **(b)**

$\Rightarrow$ $CP_P = 5400, \quad MP_P = 5860$

$$\frac{5400 \times 4}{5} = CP_Q$$

$$CP_Q = 7200$$

$$SP_Q = ?$$

$$\text{Profit }\% = \frac{\text{Profit}}{\text{CP}} \times 100 \text{ [for Q]}$$

$$25 = \left(\frac{SP - 7200}{7200}\right)100$$

$$SP_Q = 9000$$

$$\text{Discount Q} = MP_Q - SP_Q = 1000$$

$$\text{Discount \%} = \frac{1000}{10000} \times 100 = 10\%$$

End of Solution

Q.10 The ratio of boys to girls in a class is 7 to 3.
Among the options below, an acceptable value for the total number of students in the class is:

(a) 37
(b) 50
(c) 21
(d) 73

Ans. **(b)**

$$\text{Boys} = 7x, \quad \text{Girls} = 3x$$

Total number of students = $10x$

Now, $7x$ and $3x$ should be integers.

Hence, x should be integer.

So $10x$ should be an integer.

Only 50 satisfies the above constraints.

End of Solution

■■■■

SECTION - B TECHNICAL

Q.1 Consider the following C code segment:

$a = b + c;$
$e = a + 1;$
$d = b + c;$
$f = d + 1;$
$g = e + f;$

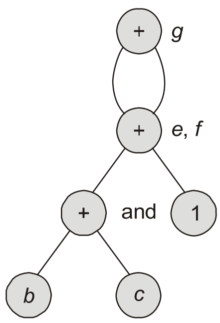
In a compiler, this code segment is represented internally as a directed acyclic graph (DAG). The number of nodes in the DAG is ________.

Ans. (6)

$a = b + c;$
$e = a + 1;$
$d = b + c;$
$f = d + 1;$
$g = e + f;$

Using common sub-expression elimination this code will become.

$a = b + c$
$e = a + 1$
$d = a$
$f = e$
$g = e + e$



Number of nodes = 6

End of Solution

Q.2 Consider the two statements:

S_1 : There exist random variables X and Y such that

$(E[X - E(X)) (Y - E(Y))]^2) > Var[X] Var[Y])$

S_2 : For all random variables X and Y

$Cov[X, Y] = E[|X - E[X]||Y - E[Y]|]$

Which one of the following choices is correct?

(a) Both S_1 and S_2 are false.
(b) Both S_1 and S_2 are true.
(c) S_1 is true, but S_2 is false.
(d) S_1 is false, but S_2 is true.

Ans. **(a)**

S_2 : $\text{Cov}(x, y) = E\{|x - \bar{x}||y - \bar{y}|\}$ is false

Case-I: If $x > \bar{x}$ and $y > \bar{y}$ then above is true.

Case-II: If $x < \bar{x}$ and $y < \bar{y}$ then above is true.

Case-III: If $x > \bar{x}$ but $y < \bar{y}$ then above is false.

Case-IV: If $x < \bar{x}$ but $y > \bar{y}$ then above is false.

$\because$ Given expression is not always true. So we can conclude that it is false.

S_1 : It is obviously false.

$\because$ True statement is $[E\{(x - \bar{x})(y - \bar{y})\}]^2 < \text{var}(x) \cdot \text{Var}(y)$

So both S_1 and S_2 are false.

End of Solution

Q.3 Consider the following two statements:

S_1 : Destination MAC address of an ARP reply is a broadcast address.

S_2 : Destination MAC address of an ARP request is a broadcast address.

Which one of the following choices is correct?

(a) S_1 is false and S_2 is true.
(b) Both S_1 and S_2 are false.
(c) Both S_1 and S_2 are true,
(d) S_1 is true and S_2 is false.

Ans. **(a)**

ARP request is broadcasting.

ARP reply is unicasting.

End of Solution

Q.4 Three processes arrive at time zero with CPU bursts of 16, 20 and 10 milliseconds. If the scheduler has prior knowledge about the length of the CPU bursts, the minimum achievable average waiting time for these three processes in a non-preemptive scheduler (round to nearest integer) is ________ milliseconds.

Ans. (12)

WT	CT	P. No.	AT	BT
0	10	A	0	16
26	46	B	0	20
10	26	C	0	10

C	A	B

0 10 26 46

$$\text{Average writing time} = \frac{0+26+10}{3}$$

$$= \frac{36}{3} = 12$$

End of Solution

Q.5 Consider the following matrix:

$$\begin{pmatrix} 0 & 1 & 1 & 1 \\ 1 & 0 & 1 & 1 \\ 1 & 1 & 0 & 1 \\ 1 & 1 & 1 & 0 \end{pmatrix}$$

The largest eigenvalue of the above matrix is ________.

Ans. (3)

$$A = \begin{bmatrix} 0 & 1 & 1 & 1 \\ 1 & 0 & 1 & 1 \\ 1 & 1 & 0 & 1 \\ 1 & 1 & 1 & 0 \end{bmatrix}$$

$$|A - \lambda I| = 0 \Rightarrow \begin{vmatrix} -\lambda & 1 & 1 & 1 \\ 1 & -\lambda & 1 & 1 \\ 1 & 1 & -\lambda & 1 \\ 1 & 1 & 1 & -\lambda \end{vmatrix} = 0$$

$$\begin{vmatrix} -\lambda+3 & 1 & 1 & 1 \\ -\lambda+3 & -\lambda & 1 & 1 \\ -\lambda+3 & 1 & -\lambda & 1 \\ -\lambda+3 & 1 & 1 & -\lambda \end{vmatrix} = 0$$

$C_1 \leftarrow C_1 + C_2 + C_3 + C_4$

$$\Rightarrow \qquad (-\lambda+3)\begin{vmatrix} 1 & 1 & 1 & 1 \\ 1 & -\lambda & 1 & 1 \\ 1 & 1 & -\lambda & 1 \\ 1 & 1 & 1 & -\lambda \end{vmatrix} = 0$$

$R_2 \leftarrow R_2 - R_1,\ R_3 \leftarrow R_3 - R_1,\ R_4 \leftarrow R_4 - R_1$

$$\Rightarrow \quad (-\lambda+3)\begin{vmatrix} 1 & 1 & 1 & 1 \\ 0 & -\lambda-1 & 0 & 0 \\ 0 & 0 & -\lambda-1 & 0 \\ 0 & 0 & 0 & -\lambda-1 \end{vmatrix} = 0$$

or $\qquad (-\lambda + 3)\ (-\lambda - 1)^3 = 0$

$\Rightarrow \qquad \lambda = 3,\ -1,\ -1,\ -1,$

So maximum eigen value is $\lambda = 3$.

End of Solution

Q.6 Consider the following grammar (that admits a series of declarations, followed by expressions) and the associated syntax directed translation (SDT) actions, given as pseudo-code:

$P \rightarrow D^*\ E^*$

$D \rightarrow$ int ID {record that ID.lexeme is of type int}

$D \rightarrow$ bool ID {record that ID.lexeme is of type bool}

$E \rightarrow E_1 + E_2$ {check that E_1.type = E_2.type = int; set E.type := int}

$E \rightarrow\ !E_1$ {check that E_1.type = bool; set E.type := bool}

$E \rightarrow$ ID {set E.type := int}

With respect to the above grammar, which one of the following choices is correct?

(a) The actions can be used to type-check syntactically correct integer variable declarations and integer expressions.

(a) The actions can be used to type-check syntactically correct boolean variable declarations and boolean expressions.

(c) The actions will lead to an infinite loop.

(d) The actions can be used to correctly type-check any syntactically correct program.

Ans. (a)

1. $P \rightarrow D^*\ E^*$
2. $D \rightarrow$ int ID {record that ID.lexeme is of type int}
3. $D \rightarrow$ bool ID {record that ID.lexeme is of type bool}
4. $E \rightarrow E_1 + E_2$ {check that E_1.type = E_2.type = int; set E.type = int}
5. $E \rightarrow\ !E_1$ {check that E_1.type = bool; set E.type = bool}
6. $E \rightarrow$ ID {set E.type = int}

Rules 2 and 3 are used for entry into the symbol table. Rule 4 is used for type checking of the integer expression. But, in rule 6 only int type is set.

Hence answer is option (a).

End of Solution

Q.7 Define R_n to be the maximum amount earned by cutting a rod of length n meters into one or more pieces of integer length and selling them. For $i > 0$, let $p[i]$ denote the selling price of a rod whose length is i meters. Consider the array of prices:

$$p[1] = 1,\ p[2] = 5,\ p[3] = 8,\ p[4] = 9,\ p[5] = 10,\ p[6] = 17,\ p[7] = 18$$

Which of the following statements is/are correct about R_7?

(a) $R_7 = 19$

(b) $R_7 = 18$

(c) R_7 is achieved by three different solutions.

(d) R_7 cannot be achieved by a solution consisting of three pieces.

Ans. (b, c)

R_7 : Maximum amount earned by cutting rod of length '7' into 1, 2, 3, 4, 5, 6, 7 pieces (whichever way is maximum)

$$\mathbf{p[7] = 18}$$
$$\mathbf{p[6] + p[1] = 17 + 1 = 18}$$

(Also, R_7 is achieved by 3 diff. solution)

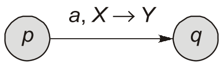
$$p[5] + p[2] = 10 + 5 = 15$$
$$p[4] + p[3] = 9 + 8 = 17$$
$$p[5] + p[1] + p[1] = 10 + 1 + 1 = 12$$
$$p[4] + p[2] + p[1] = 9 + 5 + 1 = 15$$
$$p[4] + p[1] + p[1] + p[1] = 9 + 3(1) = 12$$
$$p[3] + p[4] = 17$$
$$p[3] + p[3] + p[1] = 8 + 8 + 1 = 17$$
$$\mathbf{p[3] + p[2] + p[2] = 8 + 5 + 5 = 18}$$

(R_7 is achieved by 3 diff. pieces)

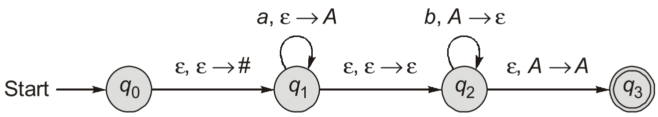
$$p[3] + 4\,p[1] = 8 + 4 = 12$$
$$p[2] + p[5] = 15$$
$$p[2] + p[4] + p[1] = 5 + 9 + 1 = 15$$
$$p[2] + p[3] + p[2] = 18$$
$$p[2] + 5\,p[15] = 5 + 5 = 10$$
$$p[2] + p[2] + 3\,p[1] = 5 + 5 + 3 = 13$$

End of Solution

Q.8 In a pushdown automaton $P = (Q, \Sigma, \Gamma, \delta, q_0, F)$, a transition of the form,



where $p, q, \in Q$, $a \in \Sigma \cup \{\varepsilon\}$, and $X, Y \in \Gamma \cup \{\varepsilon\}$, represents $(q, Y) \in \delta(p, a, X)$
Consider the following pushdown automaton over the input alphabet $\Sigma\{a, b\}$ and stack alphabet $\Gamma = \{\#, A\}$.



The number of strings of length 100 accepted by the above pushdown automaton is ________.

Ans. **(50)**

The machine is pushing a "A" for every 'a' in input and popping a "A" for every 'b' in input which follows a's. No a's are allowed after the b's and also at end of input, the stack must have at least one "A" for string to be accepted, which means number of a's > number of b's.

So language accepted is

$$L = \{a^m b^n \mid m > n \geq 0\}$$

Now strings of length 100 which satisfy above condition are $\{a^{100}, a^{99}b, a^{98}b^2, \ldots\ldots, a^{51}b^{48}\}$.
Number of such strings is therefore 50.

End of Solution

Q.9 Suppose that L_1 is a regular language and L_2 is a context-free language. Which one of the following languages is NOT necessarily context-free?

(a) $L_1 \cdot L_2$
(b) $L_1 \cup L_2$
(c) $L_1 - L_2$
(d) $L_1 \cap L_2$

Ans. **(c)**

$L_1 \rightarrow$ Reg
$L_2 \rightarrow$ Context-free

(a) $L_1 \cdot L_2 = \text{Reg} \cdot \text{CFL} = \text{CFL} \cdot \text{CFL} = \text{CFL}$

(b) $L_1 \cup L_2 = \text{Reg} \cup \text{CFL} = \text{CFL}$

(c) $L_1 - L_2 = L_1 \cap \overline{L_2} = \text{Reg} \cap \overline{\text{CFL}} = \text{Reg} \cap \overline{\text{CSL}}$

$= \text{Reg} \cap \text{CSL} = \text{CSL}$

(d) $L_1 \cap L_2 = \text{Reg} \cap \text{CFL} = \text{CFL}$

So (c) is not necessarily CFL.

End of Solution

Q.10 A TCP server application is programmed to listen on port number P on host S. A TCP client is connected to the TCP server over the network.

Consider that while the TCP connection was active, the server machine S crashed and rebooted. Assume that the client does not use the TCP keepalive timer.

Which of the following behaviors is/are possible?

(a) If the client sends a packet after the server reboot, it will receive a FIN segment.
(b) If the client was waiting to receive a packet, it may wait indefinitely.
(c) The TCP server application on S can listen on P after reboot.
(d) If the client sends a packet after the server reboot, it will receive a RST segment.

Ans. **(b, c, d)**

(a) False: The situation resolves itself when client tries to send data to server over the dead connection, and server replies with an RST packet (not FIN), causing client to finally to close the connection forcibly.

FIN is used to close TCP connections gracefully in each direction (normal close of connection), while TCP RST is used in a scenario where TCP connections cannot recover from errors and the connection needs to reset forcibly.

(b) True: Since broken connections can only be detected by sending data, the receiving side will wait forever. This scenario is called a "half-open connection" because one side realizes the connection was lost but the other side believes it is still active.

(c) True: Yes, a TCP Server can listen to same port number even after reboot. For example, the SMTP service application usually listens on TCP port 25 for incoming requests. So, even after reboot the port 25 is assigned to SMTP.

(d) True: The situation resolves itself when client tries to send data to server over the dead connection, and server replies with an RST packet (not FIN).

End of Solution

Q.11 There are 6 jobs with distinct difficulty levels, and 3 computers with distinct processing speeds. Each job is assigned to a computer such that:

- The fastest computer gets the toughest job and the slowest computer gets the easiest job.
- Every computer gets at least one job.

The number of ways in which this can be done is ________.

Ans. **(65)**

Let computers be A, B and C

Toughest job assigned to fastest computer (Say, A) is 1 way.

Easiest job assigned to shortest computer (Say, B) is 1 way.

Remaining 4 jobs to be assigned to 3 computers so that the computer C gets at least one job, since A and B already assigned a job.

Number of ways 4 jobs assigned to 3 computers = 3^4.

Number of ways 4 jobs assigned to 3 computers, so that computer C does not get any job = 2^4.

Required number of ways $= 3^4 - 2^4 = 81 - 16 = 65$ ways

End of Solution

Q.12 Consider two hosts P and Q connected through a router R. The maximum transfer unit (MTU) value of the link between P and R is 1500 bytes, and between R and Q is 820 bytes.

A TCP segment of size 1400 bytes was transferred from P to Q through R, with IP identification value as 0x1234. Assume that the IP header size is 20 bytes. Further, the packet is allowed to be fragmented, i.e., Don't Fragment (DF) flag in the IP header is not set by P.

Which of the following statements is/are correct?

(a) Two fragments are created at R and the IP datagram size carrying the second fragment is 620 bytes.

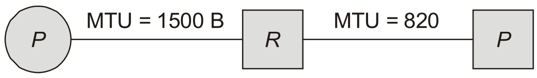
(b) If the second fragment is lost, P is required to resend the whole TCP segment.

(c) TCP destination port can be determined by analysing only the second fragment.

(d) If the second fragment is lost, R will resend the fragment with the IP identification value 0x1234

Ans. **(a, b)**

Data = 1400 B



For First Link – PR – There will be no fragment

For Second Link – RQ

First Fragment = 800(Data) + 20(Header) = 820 B

Second Fragment = 1400 – 800 = 600 + 20(H) = 620 B

End of Solution

Q.13 For a Turing machine M, $\langle M \rangle$ denotes an encoding of M. Consider the following two languages:

$L_1 = \{\langle M \rangle \mid M \text{ takes more than 2021 steps on all inputs}\}$

$L_2 = \{\langle M \rangle \mid M \text{ takes more than 2021 steps on some input}\}$

Which one of the following options is correct?

(a) Both L_1 and L_2 are decidable.

(b) L_1 is undecidable and L_2 is decidable.

(c) Both L_1 and L_2 are undecidable.

(d) L_1 is decidable and L_2 is undecidable.

Ans. **(a)**

$L_1 = \{\langle M \rangle \mid M \text{ takes more than 2021 steps on all inputs}\}$

$L_2 = \{\langle M \rangle \mid M \text{ takes more than 2021 steps on some input}\}$

A Turing machine reads at most 2021 bits of input while making 2021 steps. So the halting behaviour is completely determined by the first 2021 bits of input. Now the number of strings with 2021 bits is finite and so generate all of them and in finite amount of time we can check if the given TM, M halts on any of these strings.

For L_1, the algorithm will be as follows,

Does not halts on all of these strings → Yes

Halts on at least one of these strings → No

For L_2, the algorithm will be as follows,

does not halt on at least one of these strings $\rightarrow$ Yes

Halts on all of these strings $\rightarrow$ No

So, both L_1 and L_2 are decidable.

End of Solution

Q.14 In an undirected connected planar graph G, there are eight vertices and five faces. The number of edges in G is ________.

Ans. **(11)**

In a connected planar graph

$$r = e - n + 2$$

Here, $n = 8, \quad r = 5$

$\therefore$ $5 = e - 8 + 2$

$$e = 11$$

End of Solution

Q.15 Consider the following array:

23	32	45	69	72	73	89	97

Which algorithm out of the following options uses the least number of comparisons (among the array elements) to sort the above array in ascending order?

(a) Quicksort using the last element as pivot
(b) Selection sort
(c) Mergesort
(d) Insertion sort

Ans. **(d)**

Given array already sorted.

$\therefore$ Insertion sort takes least number of comparisons $\theta(n)$.

Since, for a number which is to be inserted in the already sorted array, only 1 comparison will be required.

End of Solution

Q.16 Consider the following language:

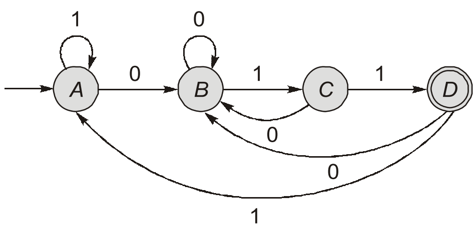
$L = \{w \in \{0,1\}^* \mid w \text{ ends with the substring } 011\}$

Which one of the following deterministic finite automata accepts L?

(a) 
(b) 
(c) 
(d) 
Ans. **(a)**

Since 4 states are required in minimal DFA for this language "Ending with 011", and since all given DFA's have 4 states, the answer must be same as minimal DFA.

The minimal DFA for this language is given below:



Which is same as option (a).

End of Solution

Q.17 Let p and q be two propositions. Consider the following two formulae in prepositional logic.

S_1 : $(\neg p \wedge (p \vee q)) \rightarrow p$
S_2 : $q \rightarrow (\neg p \wedge (p \vee q))$

Which one of the following choices is correct?

(a) Neither S_1 nor S_2 is a tautology.
(b) Both S_1 and S_2 are tautologies.
(c) S_1 is a tautology but S_2 is not a tautology.
(d) S_1 is not a tautology but S_2 is a tautology.

Ans. (c)

S_1 : $(\neg p \wedge (p \vee q)) \rightarrow p$
S_2 : $q \rightarrow (\neg p \wedge (p \vee q))$

$$
\begin{aligned}
S_1 &: [p'(p+q)] \rightarrow p \\
&\equiv (p'p + p'q) \rightarrow q \\
&\equiv p'q \rightarrow q \\
&\equiv (p'q)' + q \\
&\equiv p + q' + q \\
&\equiv p + 1 \\
&\equiv 1 \text{ (tautology)}
\end{aligned}
$$

$$
\begin{aligned}
S_2 &: q \rightarrow (p'(p+q)) \\
&\equiv q \rightarrow (p'p + p'q) \\
&\equiv q \rightarrow p'q \\
&\equiv q' + p'q \\
&\equiv (q' + p')(q' + q) \\
&\equiv q' + p' \text{ (contigency) (not a tautology)}
\end{aligned}
$$

So, option (c) S_1 is a tautology and S_2 is not a tautology is correct.

End of Solution

Q.18 Suppose a database system crashes again while recovering from a previous crash. Assume checkpointing is not done by the database either during the transactions or during recovery.

Which of the following statements is/are correct?

(a) The same undo and redo list will be used while recovering again.

(b) The system cannot recover any further.

(c) The database will become inconsistent.

(d) All the transactions that are already undone and redone will not be recovered again.

Ans. (a)

End of Solution

Q.19 A relation R is said to be circular if aRb and bRc together imply cRa.

Which of the following options is/are correct?

(a) If a relation S is reflexive and circular, then S is an equivalence relation.

(b) If a relation S is circular and symmetric, then S is an equivalence relation.

(c) If a relation S is transitive and circular, then S is an equivalence relation.

(d) If a relation S is reflexive and symmetric, then S is an equivalence relation.

Ans. (a)

Let S be reflexive and circular,

Let us checking symmetry:

Symmetry:

Let xSy

Now since S is reflexive ySy true.

So xSy and ySy is true

Now by circular property we get, ySx

So $$xSy \Rightarrow ySx$$

So S is symmetric.

Transitive:

Let xSy and ySz

Now by circular property we get zSx and by symmetry property proved above, we get

$$zSx \Rightarrow xSz$$

So $$xSy \text{ and } ySz \Rightarrow xSz$$

So S is transitive.

So S is reflexive, symmetric and transitive and hence an equivalence relation.

So option (a) is true.

Option (b): Let S be circular and symmetric.

Let S be defined on set {1, 2, 3}

Now empty relation is circular and symmetric but not reflexive. So S need not be an equivalence relation.

So option (b) is false.

Option (c): Let S be transitive and circular.

Let S be defined on the set {1, 2, 3}

Now empty relation again satisfies transitive and circular but is not reflexive. So S need not be an equivalence relation.

So option (c) is false.

Option (d): Reflexive and symmetric need not be transitive for example on {1, 2, 3}.

$$S = \{(1, 1), (2, 2), (3, 3), (1, 2), (2, 1), (2, 3), (3, 2)\}$$

is reflexive and symmetric. But it is not transitive because (1, 2) and (2, 3) belong to S but (1, 3) does not.

So option (d) is false.

End of Solution

Q.20 Let P be an array containing n integers. Let t be the lowest upper bound on the number of comparisons of the array elements, required to find the minimum and maximum values in an arbitrary array of n elements. Which one of the following choices is correct?

(a) $t > n$ and $t \le 3\left\lceil \frac{n}{2} \right\rceil$

(b) $t > 3\left\lceil \frac{n}{2} \right\rceil$ and $t \le 2n-2$

(c) $t > 2n - 2$

(d) $t > \lceil \log_2(n) \rceil$ and $t \le n$

Ans. **(b)**

$t > 3\left\lceil \frac{n}{2} \right\rceil$ and $t \le 2n-2$

Using straight max-min algo, WC number of comparisons = $2n - 2$.

Using divide and conquer min-max algo, WC number of comparisons = $\frac{3n}{2} - 2$.

[Note: But the official answer key given by IIT-Bombay is option (a)]

End of Solution

Q.21 In the context of operating systems, which of the following statements is/are correct with respect to paging?

(a) Paging incurs memory overheads.

(b) Multi-level paging is necessary to support pages of different sizes.

(c) Page size has no impact on internal fragmentation.

(d) Paging helps solve the issue of external fragmentation.

Ans. **(a, d)**

End of Solution

Q.22 The lifetime of a component of a certain type is a random variable whose probability density function is exponentially distributed with parameter 2. For a randomly picked component of this type, the probability that its lifetime exceeds the expected lifetime (rounded to 2 decimal places) is ________.

Ans. **(0.367)**

Let, t = {lifetime of component} and $\mu = 2$

$$\text{Expected lifetime} = \frac{1}{\mu} \text{ and } f(t) = \begin{cases} \mu e^{-\mu t}, & t > 0 \\ 0, & \text{otherwise} \end{cases}$$

$$P\left(t > \frac{1}{\mu}\right) = \int_{\frac{1}{\mu}}^{\infty} f(t)dt = \int_{\frac{1}{\mu}}^{\infty} \mu e^{-\mu t} dt = -\left[e^{-\mu t}\right]_{\frac{1}{2}}^{\infty} = -\left[0 - e^{-1}\right]$$

$$= \frac{1}{e} = \frac{1}{2.713} = 0.367$$

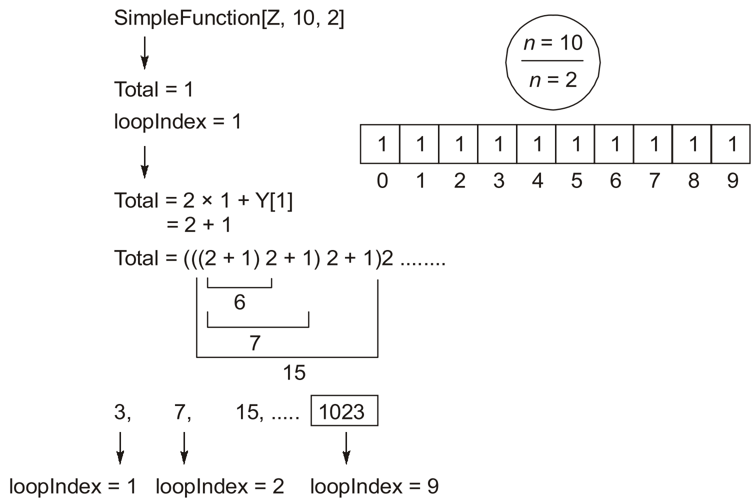
End of Solution

Q.23 Consider the following ANSI C function:

```
int SimpleFunction (int Y[ ], int n, int x)
{
    int total = Y[0], loopIndex;
    for (loopIndex = 1; loopIndex <= n – 1; loopIndex++)
    total = x × total + Y[loopIndex];
    return total;
}
```

Let Z be an array of 10 elements with Z[i] = 1, for all i such that $0 \le i \le 9$. The value returned by SimpleFunction (Z, 10, 2) is ________.

Ans. **(1023)**



End of Solution

Q.24 Consider a linear list based directory implementation in a file system. Each directory is a list of nodes, where each node contains the file name along with the file metadata, such as the list of pointers to the data blocks. Consider a given directory foo.

Which of the following operations will necessarily require a full scan of foo for successful completion?

(a) Opening of an existing file in foo
(b) Renaming of an existing file in foo
(c) Creation of a new file in foo
(d) Deletion of an existing file from foo

Ans. (a, b, d)

[Note: But the official answer key given by IIT-Bombay is option (b, c)]

End of Solution

Q.25 Let $G = (V, E)$ be an undirected unweighted connected graph. The diameter of G is defined as

$$\text{diam}(G) = \max_{u,v \in V} \{\text{the length of shortest path between } u \text{ and } v\}$$

Let M be the adjacency matrix of G.

Define graph G_2 on the same set of vertices with adjacency matrix N, where

$$N_{ij} = \begin{cases} 1 & \text{if } M_{ij} > 0 \text{ or } P_{ij} > 0, \text{ where } P = M^2 \\ 0 & \text{Otherwise} \end{cases}$$

Which one of the following statements is true?

(a) $\lceil \text{diam}(G)/2 \rceil < \text{diam}(G_2) < \text{diam}(G)$

(b) $\text{diam}(G_2) \le \lceil \text{diam}(G)/2 \rceil$

(c) $\text{diam}(G) < \text{diam}(G_2) \le 2\ \text{diam}(G)$

(d) $\text{diam}(G_2) = \text{diam}(G)$

Ans. (b)

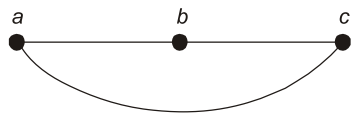
$$N_{ij} = \begin{cases} 1 & \text{if } M_{ij} > 0 \text{ or } P_{ij} > 0, \text{ where } P = M^2 \\ 0 & \end{cases}$$

Means G_2 will have not only all the edges of in G, but also will have edges connecting vertices in G which have a path of length 2, since M^2 will have all edges between u and v if there is a path of length 2 between shown in G.

Option (a) $\lceil \text{diam}(G)/2 \rceil < \text{diam}(G_2) < \text{diam}(G)$

Let G be the graph shown below with dia(G) = 2

Now G_2 will be

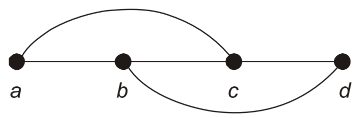


Since (a, c) has a path of length 2 in G, G_2 will have an edge connecting a and c.
Now diameter of G_2 = 1
This violates option (a) condition that dia(G_2) > dia(G)/2.
So option (a) false.

Option (b) $\text{diam}(G_2) \le \lceil \text{diam}(G)/2 \rceil$

Consider graph below with dia(G) = 3

Now G_2 will connect all paths of length 2 with edges and will be



Now $\qquad \text{dia}(G_2) = 2$
But $\qquad \text{dia}(G) = 3$

$$\text{dia}(G_2) \le \lceil \text{dia}(G)/2 \rceil$$

$$2 \le \lceil 1.5 \rceil$$

$$2 \le 2$$

Satisfied.
Option (b) is correct.
Option (c) diam(G) < diam(G_2) ≤ 2 diam(G)
Taking previous option example where dia(G) = 3 and dia(G_2) = 2

$$3 \le 2 \le 6$$

Is false.
So option (c) is false.
Option (d) diam(G_2) = diam(G)
Taking previous example where dia(G) = 3 and dia(G_2) = 2

$$2 = 3 \text{ is false}$$

So option (d) is false.
So correct option is option (b).

End of Solution

Q.26 Consider the following context-free grammar where the set of terminals is $\{a, b, c, d, f\}$

$S \to daT \mid Rf$
$T \to aS \mid baT \mid \epsilon$
$R \to caTR \mid \epsilon$

The following is a partially-filled LL(1) parsing table.

	a	b	c	d	f	$
S			(1)	$S \to daT$	(2)	
T	$T \to aS$	$T \to baT$	(3)		$T \to \epsilon$	(4)
R			$R \to caTR$		$R \to \epsilon$	

Which one of the following choices represents the correct combination for the numbered cells in the parsing table ("blank" denotes that the corresponding cell is empty)?

(a) (1) $S \to Rf$ (2) blank (3) blank (4) $T \to \epsilon$

(b) (1) blank (2) $S \to Rf$ (3) $T \to \epsilon$ (4) $T \to \epsilon$

(c) (1) blank (2) $S \to Rf$ (3) blank (4) blank

(d) (1) $S \to Rf$ (2) $S \to Rf$ (3) $T \to \epsilon$ (4) $T \to \epsilon$

Ans. **(d)**

$S \to daT \mid Rf$
$T \to aS \mid baT \mid \epsilon$
$R \to caTR \mid \epsilon$

First (S) = $\{d, c, f\}$ Follow (S) = $\{c, f, \$\}$
First (T) = $\{a, b, \epsilon\}$ Follow (T) = $\{c, f, \$\}$
First (R) = $\{c, \epsilon\}$ Follow (R) = $\{f\}$

	a	b	c	d	f	$
S			(1) $S \to Rf$	$S \to daT$	(2) $S \to Rf$	
T	$T \to aS$	$T \to baT$	(3) $T \to \epsilon$		$T \to \epsilon$	(4) $T \to \epsilon$
R			$R \to caTR$		$R \to \epsilon$	

(1) $S \to Rf$ (2) $S \to Rf$ (3) $T \to \epsilon$ (4) $T \to \epsilon$

Hence option (d) is answer.

End of Solution

Q.27 Let $\langle M \rangle$ denote an encoding of an automaton M. Suppose that $\Sigma\{0, 1\}$. Which of the following languages is/are NOT recursive?

(a) $L = \{\langle M \rangle | M$ is a DFA such that $L(M) = \Sigma^*\}$

(b) $L = \{\langle M \rangle | M$ is a PDA such that $L(M) = \Sigma^*\}$

(c) $L = \{\langle M \rangle | M$ is a PDA such that $L(M) = \phi\}$

(d) $L = \{\langle M \rangle | M$ is a DFA such that $L(M) = \phi\}$

Ans. **(b)**

Option (a): Completeness problem for regular $\rightarrow$ Decidable
$\rightarrow$ Recursive

Option (b): Completeness problem for CFL's $\rightarrow$ Undecidable
$\rightarrow$ Not recursive

Option (c): Emptiness problem for CFL's $\rightarrow$ Decidable
$\rightarrow$ Recursive

Option (d): Emptiness problem for Regular $\rightarrow$ Decidable
$\rightarrow$ Recursive

So only option (b) is not recursive.

End of Solution

Q.28 Consider the following instruction sequence where registers R1, R2 and R3 are general purpose and MEMORY[X] denotes the content at the memory location X.

Instruction	Semantics	Instruction Size (bytes)
MOV R1, (5000)	R1 $\leftarrow$ MEMORY [5000]	4
MOV R2, (R3)	R2 $\leftarrow$ MEMORY [R3]	4
ADD R2, R1	R2 $\leftarrow$ R1 + R2	2
MOV (R3), R2	MEMORY [R3] $\leftarrow$ R2	4
INC R3	R3 $\leftarrow$ R3 + 1	2
DEC R1	R1 $\leftarrow$ R1 – 1	2
BNZ 1004	Branch if not zero to the given absolute address	2
HALT	Stop	1

Assume that the content of the memory location 5000 is 10 and the content of the register R3 is 3000. The content of each of the memory locations from 3000 to 3010 is 50. The instruction sequence starts from the memory location 1000. All the numbers are in decimal format. Assume that the memory is byte addressable.

After the execution of the program, the content of memory location 3010 is ________.

Ans. **(50)**

Program execution 10 memory cells information is accessed for reading & writing starting from 3000 location.

So, 3000 to 3009 cells are accessed for read and write.

$\therefore$ No change in [3010] cell.

So, it contain 50 only.

End of Solution

Q.29 An *articulation point* in a connected graph is a vertex such that removing the vertex and its incident edges disconnects the graph into two or more connected components.

Let T be a DFS tree obtained by doing DFS in a connected undirected graph G.

Which of the following options is/are correct?

(a) Root of T is an articulation point in G if and only if it has 2 or more children.

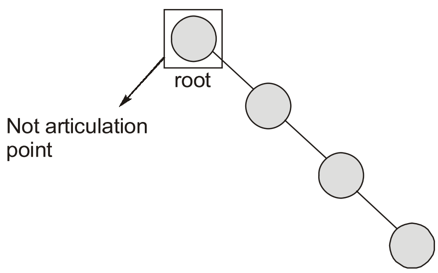
(b) A leaf of T can be an articulation point in G.

(c) Root of T can never be an articulation point in G.

(d) If u is an articulation point in G such that x is an ancestor of u in T and y is a descendent of u in T, then all paths from x to y in G must pass through u.

Ans. **(a)**

(a) True

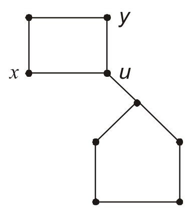


We need at least 2 children so that root is articulation point.

(b) False: This can never happen. Leaf will always have degree = 1.

(c) False: Check option (a) for more information.

(d) False: Below is the reasoning to show how this is false.



If u is articulation point, then removing u generates 2 connected components, now there might be a case when x and y will belong to either one of the connected component and hence a path will exist between them without passing through u.

Option (a) is correct.

End of Solution

Q.30 Consider the relation $R(P, Q, S, T, X, Y, Z, W)$ with the following functional dependencies

$$PQ \to X;\ P \to YX;\ Q \to Y;\ Y \to ZW$$

Consider the decomposition of the relation R into the constituent relations according to the following two decomposition schemes.

D_1 : $R = [(P, Q, S, T); (P, T, X); (Q, Y); (Y, Z, W)]$

D_2 : $R = [(P, Q, S); \{T, X); (Q, Y): (Y, Z, W)]$

Which one of the following options is correct?

(a) D_1 is a lossy decomposition, but D_2 is a lossless decomposition.
(b) Both D_1 and D_2 are lossless decompositions.
(c) Both D_1 and D_2 are lossy decompositions.
(d) D_1 is a lossless decomposition, but D_2 is a lossy decomposition.

Ans. **(d)**

- D_1: $R_1(P, Q, S, T)$ $R_2(P, T, X)$ $R_3(Q, Y)$ $R_4(Y, Z, W)$

  $R_1R_2(P, Q, S, T, X)$
  $PT \to X$
  [common attributes is a key of R_2 so lossless R_{12}]

  $R_{34}(Q, Y, Z, W)$
  $Y \to ZW$
  [common attributes is a key of R_4 so lossless R_{34}]

  $R_{12}(P, Q, S, T, X)$ $R_{34}(Q, Y, Z, W)$

  $Q^+ = \{Q, Y, Z, W\}$

  $R_{1234}(P, Q, S, T, X, Y, Z, W)$
  $Q \to YZW$
  [common attributes is a key of R_{34} overall lossless decomposition]

- D_2: $R_1(P, Q, S)$ $R_2(T, X)$ $R_3(Q, Y)$ $R_4(Y, Z, W)$

  $R_1(T, X)$ $R_1(P, Q, S)$ $R_{34}(Q, Y, Z, W)$

  $Y \to ZW$ [lossless R_{34}]

  $R_2(T, X)$ $R_{134}(P, Q, S, Y, Z, W)$ $Q \to YZW$ [lossless R_{134}]

  $\underbrace{R_2(T, X) \quad R_{134}(P, Q, S, Y, Z, W)}_{\text{No common attribute} \Rightarrow \text{Lossy}}$

D_1 is a lossless decomposition, but D_2 is a lossy decomposition.

End of Solution

Q.31 A five-stage pipeline has stage delays of 150, 120, 150, 160 and 140 nanoseconds. The registers that are used between the pipeline stages have a delay of 5 nanoseconds each.

The total time to execute 100 independent instructions on this pipeline, assuming there are no pipeline stalls, is ________ nanoseconds.

Ans. (17160)

$$K = 5$$
$$t_p = \text{max (Stage delay + Buffer delay)} = 165 \text{ ns}$$
$$n = 100 \text{ (finite)}$$
$$\downarrow$$
$$ET_{\text{pipe}} = (K + n - 1)t_p$$
$$= (5 + 100 - 1)\ 165 \text{ ns} = 17160 \text{ ns}$$

End of Solution

Q.32 Consider the sliding window flow-control protocol operating between a sender and a receiver over a full-duplex error-free link. Assume the following:

- The time taken for processing the data frame by the receiver is negligible.
- The time taken for processing the acknowledgement frame by the sender is negligible.
- The sender has infinite number of frames available for transmission.
- The size of the data frame is 2000 bits and the size of the acknowledgement frame is 10 bits.
- The link data rate in each direction is 1 Mbps (= 10^6 bits per second).
- One way propagation delay of the link is 100 milliseconds.

The minimum value of the sender's window size in terms of the number of frames, (rounded to the nearest integer) needed to achieve a link utilization of 50% is ________.

Ans. (51)

$$T_t(\text{packet}) = \frac{L}{B.W}$$

$$\Rightarrow \quad \frac{2000 \text{ bits}}{10^6 \text{ bps}} = 2 \times 10^{-3} \text{ sec} = 2 \text{ millisec}$$

$$T_t(\text{Ack}) = \frac{L}{B.W}$$

$$\Rightarrow \quad \frac{10 \text{ bits}}{10^6 \text{ bps}} = 10^{-5} \text{ sec} = 10^{-2} \text{ millisec} = 0.01 \text{ millisec}$$

$$T_p = 100 \text{ millisec}$$
$$\text{Total time} = T_t(\text{packet}) + T_p + T_t(\text{Ack})$$
$$= 2 + 100 + 0.01 = 102.01 \text{ millisec}$$

$$\text{Efficiency} = 50\% = \frac{1}{2}$$

$$\text{Efficiency} = \frac{\text{Useful time}}{\text{Total time}}$$

$$\frac{1}{2} = \frac{n \times T_t}{\text{Total time}}$$

$$\Rightarrow \quad 2 \times n = 102.01$$

$$\Rightarrow \quad n = \frac{102.01}{2} \Rightarrow 51.005$$

For minimum we have to take ceil, hence size of window = 51.

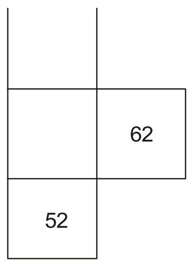
End of Solution

Q.33 Consider the following sequence of operations on an empty stack.

push(54); push(52); pop( ); push(55); push(62); s = pop( ):

Consider the following sequence of operations on an empty queue.
enqueue(21); enqueue(24); dequeue( ); enqueue(28); enqneue(32); q = dequeue( ):
The value of $s + q$ is ________.

Ans. **(86)**



S = 62
R = 24

43	24	57

S + R = 86

End of Solution

Q.34 Let the representation of a number in base 3 be 210. What is the hexadecimal representation of the number?

(a) 528 (b) 21
(c) 15 (d) D2

Ans. **(c)**

$$(210)_3 = 3^2 \times 2 + 3^1 \times 1 + 3^0 \times 0$$
$$= 18 + 3 + 0$$
$$= (21)_{10}$$

$$(21)_{10} = 16 \,\underline{|\, 21} \quad = (15)_{16}$$
$$1 \rightarrow 5$$

End of Solution

Q.35 A relation $r(A, B)$ in a relational database has 1200 tuples. The attribute A has integer values ranging from 6 to 20, and the attribute B has integer values ranging from 1 to 20. Assume that the attributes A and B are independently distributed.

The estimated number of tuples in the output of $\sigma_{(A > 10) \vee (B = 18)}(r)$ is ________.

Ans. **(820)**

- There are 10 distinct integer for $(A > 10)$ out of 15.
- There are 1 distinct integer for $(B = 18)$ out of 20.

$$P(A > 10) = \frac{10}{15} = \frac{2}{3}$$

$$P(B = 18) = \frac{1}{20}$$

$$P((A > 10) \wedge (B = 18)) = \frac{2}{3} \times \frac{1}{20} = \frac{1}{30}$$

Now,

$$P((A > 10) \vee (B = 18)) = P(A > 10) + P(B = 18) - P((A > 10) \wedge (B = 18))$$

$$= \frac{2}{3} + \frac{1}{20} - \frac{1}{30} = \frac{40+3-2}{60} = \frac{41}{60}$$

$$\text{Estimated number of tuples} = \frac{41}{60} \times 1200 = 820 \text{ tuples}$$

End of Solution

Q.36 Assume that a 12-bit Hamming codeword consisting of 8-bit data and 4 check bits is $d_8\ d_7\ d_6\ d_5\ c_8\ d_4\ d_4\ d_3\ d_2\ c_4\ d_1\ c_2\ c_1$, where the data bits and the check bits are given in the following tables:

Data bits							
d_8	d_7	d_6	d_5	d_4	d_3	d_2	d_1
1	1	0	x	0	1	0	1

Check bits			
c_8	c_4	c_2	c_1
y	0	1	0

Which one of the following choices gives the correct values of x and y?

(a) x is 0 and y is 0
(b) x is 0 and y is 1
(c) x is 1 and y is 0
(d) x is 1 and y is 1

Ans. (a)

1	2	3	4	5	6	7	8
1	0	1	0	x	0	1	1

c_1	c_2	c_4	c_8
0	1	0	y

c_1 = 1 3 5 7 9 11
0 1 0 0 x 1 $\xleftrightarrow{x=0}$

1	2	3	4	5	6	7	8	9	10	11	12
0	1	1	0	0	1	0	y	x	0	1	1

c_8 = 8 9 10 11 12
0 0 0 1 1 $\xleftrightarrow{y=0}$

End of Solution

Q.37 Let $r_i(z)$ and $w_i(z)$ denote read and write operations respectively on a data item z by a transaction T_i. Consider the following two schedules:

S_1 : $r_1(x), r_1(y), r_2(x), r_2(y), w_2(y), w_1(x)$

S_2 : $r_1(x), r_2(x), r_2(y), w_2(y), r_1(y), w_1(x)$

Which one of the following options is correct?

(a) S_1 is not conflict serializable, and S_2 is conflict serializable.
(b) Neither S_1 nor S_2 is conflict serializable.
(c) Both S_1 and S_2 are conflict serializable.
(d) S_1 is conflict serializable, and S_2 is not conflict serializable.

Ans. (a)

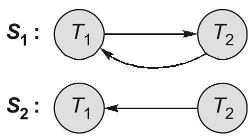
RW RW

$S_1 : r_1(x)\ r_1(y)\ r_2(x)\ r_2(y)\ w_2(y)\ w_1(x)$

$S_2 : r_1(x)\ r_2(x)\ r_2(y)\ w_2(y)\ r_1(y)\ w_1(x)$

WR

RW



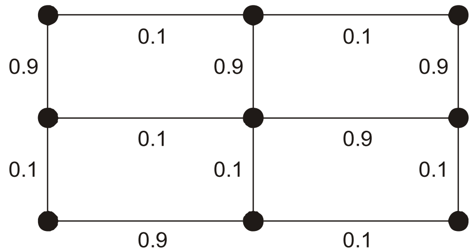
Cycle exists in precedence graph
∴ Not conflict serializable.

No cycle
∴ Conflict serializable.

S_1 is not conflict serializable, and S_2 is conflict serializable.

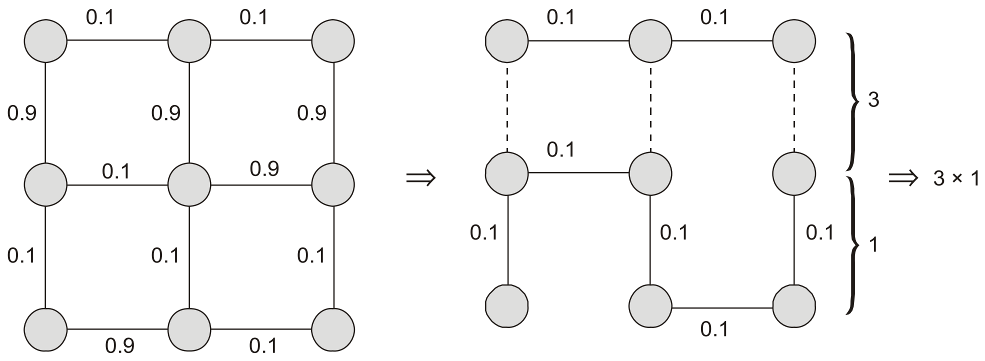
End of Solution

Q.38 Consider the following undirected graph with edge weights as shown:



The number of minimum-weight spanning trees of the graph is ________.

Ans. (3)

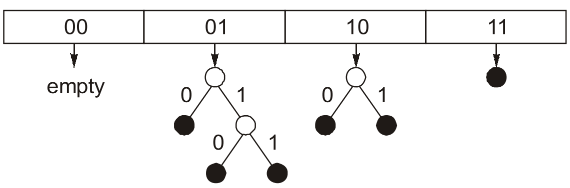


End of Solution

Q.39 Consider a dynamic hashing approach for 4-bit integer keys:

1. There is a main hash table of size 4.
2. The 2 least significant bits of a key is used to index into the main hash table,
3. Initially, the main hash table entries are empty.
4. Thereafter, when more keys are hashed into it, to resolve collisions, the set of all keys corresponding to a main hash table entry is organized as a binary tree that grows on demand.
5. First, the 3rd least significant bit is used to divide the keys into left and right subtrees.
6. To resolve more collisions, each node of the binary tree is further sub-divided into left and right subtrees based on the 4th least significant bit.
7. A split is done only if it is needed, i.e., only when there is a collision.

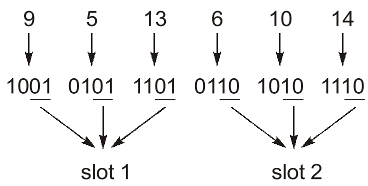
Consider the following state of the hash table.



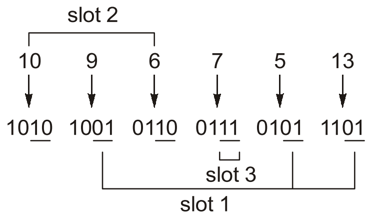
Which of the following sequences of key insertions can cause the above state of the hash table (assume the keys are in decimal notation)?

(a) 9, 5, 13, 6, 10, 14
(b) 9, 5, 10, 6, 7, 1
(c) 10, 9, 6, 7, 5, 13
(d) 5, 9: 4, 13, 10, 7

Ans. (c)



No entry for 11 in this option and 10 → has 3 entries but 2 are required.
So option (a) is wrong.
Similarly, (b), (d) options can also be proved wrong. Option (c) is correct.
Let's check option (c).



End of Solution

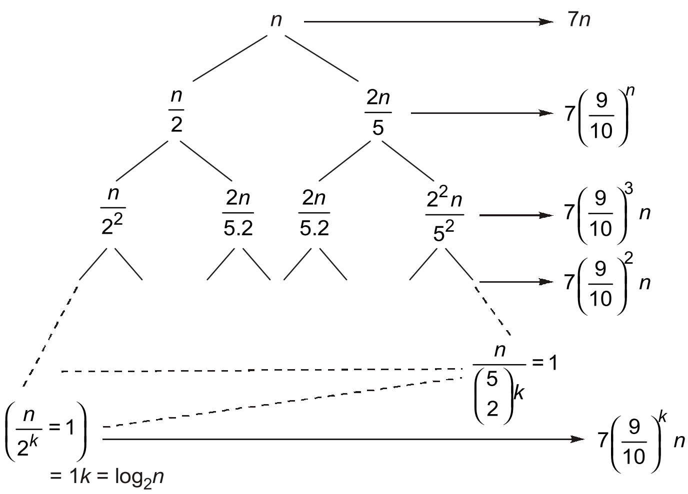
Q.40 Consider the following recurrence relation:

$$T(n) = \begin{cases} T\left(\frac{n}{2}\right) + T\left(\frac{2n}{5}\right) + 7n & \text{if } n > 0 \\ 1 & \text{if } n = 0 \end{cases}$$

Which one of the following options is correct?

(a) $T(n) = \theta(n \log n)$
(b) $T(n) = \theta(n^{5/2})$
(c) $T(n) = \theta(n)$
(d) $T(n) = \theta((\log n)^{5/2})$

Ans. (c)



$$T(n) = 7n\left[1+\frac{9}{10}+\left(\frac{9}{10}\right)^2+\left(\frac{9}{10}\right)^3+\ldots+\left(\frac{9}{10}\right)^k\right]$$

$$= \frac{7n\left[1-\left(\frac{9}{10}\right)^{k+1}\right]}{1-\frac{9}{10}} = \frac{7n}{\frac{1}{10}}\left[1-\left(\frac{9}{10}\right)^{\log_2 n+1}\right]$$

Decreasing term

$\therefore$ $$T(n) = \theta(n)$$

End of Solution

Q.41 Consider a computer system with a byte-addressable primary memory of size 2^{32} bytes. Assume the computer system has a direct-mapped cache of size 32 KB (1 KB = 2^{10} bytes), and each cache block is of size 64 bytes.
The size of the tag field is ________ bits.

Ans. **(17)**

$$\text{MM size} = 2^{32}\text{ B}$$

$$\text{Addressable size} = \log_2 2^{32} = 32\text{ bit}$$

Direct mapped

$$\text{CM size} = 32\text{ KB}$$
$$\text{Block size} = 64\text{ B}$$

$\therefore$ $$\text{Number of lines} = \frac{32\text{ K}}{64} \Rightarrow \frac{2^{15}}{2^6} = 2^9$$

Address format:

32 bit

Tag	LO	WO
17 bit	$\log_2 2^9$ → 9 bit	$\log_2 64 = 6$ bit

End of Solution

Q.42 Let G be a group of order 6, and H be a subgroup of G such that $1 < |H| < 6$. Which one of the following options is correct?

(a) Both G and H are always cyclic.
(b) G is always cyclic, but H may not be cyclic.
(c) G may not be cyclic, but H is always cyclic.
(d) Both G and H may not be cyclic.

Ans. (c)

$$|G| = 6$$

H is subgroup, so by Lagrange's theorem

$$|H| = 1, 2, 3 \text{ or } 6 \text{ (Divisor's of 6)}$$

Now it is given that $1 < |H| < 6$

or $|H| = 2$ or 3

Since 2 and 3 are both prime and since every group of prime order is cyclic, H is surely cyclic.

But order of $|G| = 6$ which is not prime.

So G may or may not be cyclic.

So G may not be cyclic, but H is always cyclic.

Option (c) is correct.

End of Solution

Q.43 The following relation records the age of 500 employees of a company, where empNo (indicating the employee number) is the key:

empAge(<u>empNo</u>, age)

Consider the following relational algebra expression:

$$\Pi_{\text{empNo}} (\text{empAge} \bowtie_{(\text{age} > \text{age1})} \rho_{\text{empNo1, age1}} (\text{empAge}))$$

What does the above expression generate?

(a) Employee numbers of all employees whose age is not the minimum.
(b) Employee numbers of all employees whose age is the minimum.
(c) Employee numbers of only those employees whose age is the maximum.
(d) Employee numbers of only those employees whose age is more than the age of exactly one other employee.

Ans. (a)

empAge(<u>empNo</u>, age)

$\Pi_{\text{empNo}} (\text{empAge} \bowtie_{(\text{age} > \text{age1})} \rho_{\text{empNo1, age1}} (\text{empAge}))$

Retrieve empNo values of emptAge those are having 'age' greater than some age.

$$\Downarrow$$

Retrieve Employee Number (empNo) of all employee whose age is greater than some employee' age.

$$\Downarrow$$

Employee number of all employees whose age is not the minimum. [Since it is greater than atleast 1 age].

End of Solution

Q.44 Consider the following expression:

$$\lim_{x \to -3} \frac{\sqrt{2x+22}-4}{x+3}$$

The value of the above expression (rounded to 2 decimal places) is _______.

Ans. (0.25)

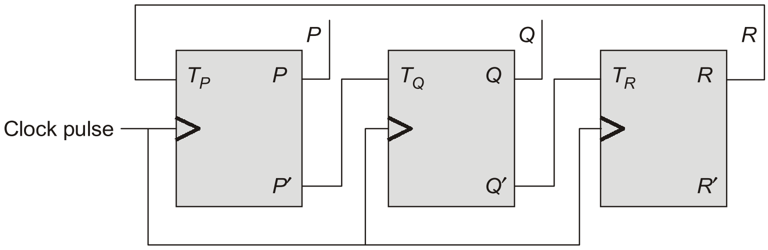
$$\lim_{x \to -3}\left(\frac{\sqrt{2x+22}-4}{x+3}\right)\left(\frac{0}{0}\text{ form}\right), \text{ so apply LHospital's rule}$$

$$= \lim_{x \to -3}\left[\frac{\frac{2}{2\sqrt{2x+22}}}{1}\right] = \lim_{x \to -3}\frac{1}{\sqrt{2x+22}}$$

$$= \frac{1}{\sqrt{16}} = \frac{1}{4} = 0.25$$

End of Solution

Q.45 Consider a 3-bit counter, designed using T flip-flops, as shown below:



Assuming the initial state of the counter given by *PQR* as 000. What are the next three states?

(a) 011, 101, 111
(b) 001, 010, 000
(c) 001, 010, 111
(d) 011, 101, 000

Ans. (d)

Clock	Present state			Flip-flop inputs			Next state		
	P	Q	R	$T_P = R$	$T_Q = \overline{P}$	$T_R = \overline{Q}$	P^+	Q^+	R^+
1	0	0	0	0	1	1	0	1	1
2	0	1	1	1	1	0	1	0	1
3	1	0	1	1	0	1	0	0	0

$\therefore$ Next three states of counter are 011, 101, 000
Hence option (d) is answer.

End of Solution

Q.46 Consider the following statements:

S_1 : Every SLR(1) grammar is unambiguous but there are certain unambiguous grammars that are not SLR(1).

S_2 : For any context-free grammar, there is a parser that takes at most $O(n^3)$ time to parse a string of length n.

Which one of the following options is correct?

(a) S_1 is true and S_2 is true
(b) S_1 is false and S_2 is false
(c) S_1 is true and S_2 is false
(d) S_1 is false and S_2 is true

Ans. (a)

S_1 : Every SLR(1) is unambiguous but every unambiguous in not SLR(1). So S_1 is true.

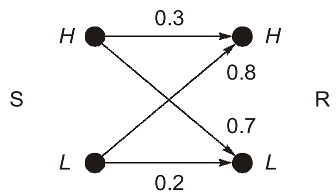
S_2 : Using CYK algorithm which takes at most $O(n^3)$ time to parse a string, where n is the length of the string. So S_2 is true.

Both S_1 is true and S_2 is true

End of Solution

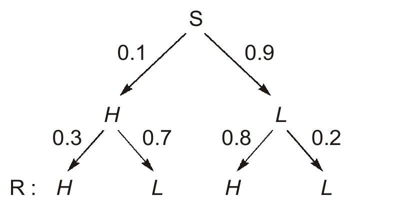
Q.47 A sender (S) transmits a signal, which can be one of the two kinds: H and L with probabilities 0.1 and 0.9 respectively, to a receiver (R).

In the graph below, the weight of edge (u, v) is the probability of receiving v when u is transmitted, where $u, v \in \{H, L\}$. For example, the probability that the received signal is L given the transmitted signal was H, is 0.7.



If the received signal is H, the probability that the transmitted signal was H (rounded to 2 decimal places) is ________.

Ans. (0.04)



$$P\left(\frac{H_S}{H_R}\right) = \frac{P(H_S \cap H_R)}{P(H_R)}$$

$$= \frac{0.1 \times 0.3}{0.1 \times 0.3 + 0.9 \times 0.8} = \frac{1}{25} = 0.04$$

End of Solution

Q.48 Consider the following ANSI C program:

```
#include <stdio.h>
int main( )
{
    int i, j, count;
    count = 0;
    i = 0;
    for (j = –3; j <= 3; j++)
    {
        if ((j >= 0) && (i++))
            count = count + j;
    }
    count = count + i;
    printf("%d", count);
    return 0;
}
```

Which one of the following options is correct?

(a) The program will compile successfully and output 8 when executed.

(b) The program will compile successfully and output 13 when executed.

(c) The program will not compile successfully.

(d) The program will compile successfully and output 10 when executed

Ans. **(d)**

$j = -3,\ j = -2,\ j = -1 \quad \Rightarrow$ Short circuiting in if((j >= 0) && (i++))

$j = 0;\ i = 0$ used but i is 1

$j = 1;\ i = 1$ used but i is 2

count = 0 + 1 = 1

$j = 2;\ i = 2$ used but i is 3

count = 1 + 2

$j = 3;\ i = 3$ used but i is 4

count = 3 + 3 = 6

count = 6 + 4 = 10 corresponding to count = count + i

Option (d) is correct.

End of Solution

Q.49 Consider the following pseudocode, where S is a semaphore initialized to 5 in line#2 and counter is a shared variable initialized to 0 in line#1. Assume that the increment operation in linc#7 is not atomic.

```
1.  int counter = 0;
2.  Semaphore S = init(5);
3.  void parop(void)
4.  {
5.       wait(S);
6.       wait(S);
7.       counter++;
8.       signal(S);
9.       signal(S);
10. }
```

If five threads execute the function parop concurrently, which of the following program behavior(s) is/are possible?

(a) The value of counter is 1 after all the threads successfully complete the execution of parop.

(b) The value of counter is 0 after all the threads successfully complete the execution of parop.

(c) There is a deadlock involving all the threads.

(d) The value of counter is 5 after all the threads successfully complete the execution of parop.

Ans. (a, c, d)

(a) True: (P_1) first process came executed wait(S); wait(S) counter++; was partially executed and the process preempted. Other process came updated counter to 4.
Now P_1 came and wrote counter to 1. So (a) is correct.

(b) Not possible at least counter will be 1.

(c) True: All 5 processes executed first wait(S) and are blocked.

(d) True: Each process executed the code sequentially and counter was finally updated to 5.

Option (a), (c) and (d) are correct.

End of Solution

Q.50 Which of the following standard C library functions will always invoke a system call when executed from a single-threaded process in a UNIX/Linux operating system?

(a) exit
(b) strlen
(c) sleep
(d) malloc

Ans. (a, c)

End of Solution

Q.51 Consider the following three functions:

$$f_1 = 10^n,\ f_2 = n^{\log n},\ f_3 = n^{\sqrt{n}}$$

Which one of the following options arranges the functions in the increasing order of asymptotic growth rate?

(a) f_2, f_3, f_1
(b) f_2, f_1, f_3
(c) f_1, f_2, f_3
(d) f_3, f_2, f_1

Ans. **(a)**

$f_2 : n^{\log n}$	$f_3 : n^{\sqrt{n}}$
$\log (n^{\log n})$	$\log\left(n^{\sqrt{n}}\right)$
$= (\log n) \cdot (\log n)$	$= \sqrt{n} \cdot \log n$

$\therefore$ $n^{\log n} = o\left(n^{\sqrt{n}}\right)$ $(f_2 < f_3)$

$f_1 = 10^n \leftarrow$ exponential function

$\therefore$ $f_1 > f_3 > f_2$

In increasing order of asymptotic growth rate.

End of Solution

Q.52 Consider the following statements:

S_1 : The sequence of procedure calls corresponds to a preorder traversal of the activation tree.

S_2 : The sequence of procedure returns corresponds to a postorder traversal of the activation tree.

Which one of the following options is correct?

(a) S_1 is false and S_2 is false
(b) S_2 is true and S_2 is false
(c) S_1 is true and S_2 is true
(d) S_1 is false and S_2 is true

Ans. **(c)**

End of Solution

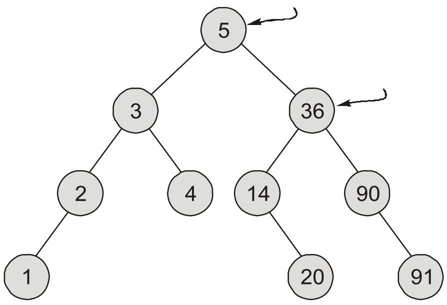
Q.53 A binary search tree T contains n distinct elements. What is the time complexity of picking an element in T that is smaller than the maximum element in T?

(a) $\theta(n)$ (b) $\theta(n \log n)$

(c) $\theta(\log n)$ (d) $\theta(1)$

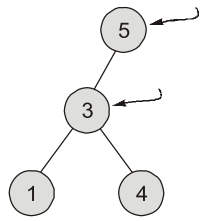
Ans. (d)

(i)



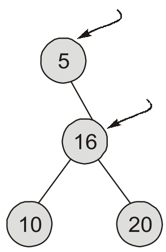
$\Rightarrow$ 5 is definitely lesser than max element

(ii)



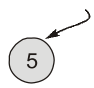
$\Rightarrow$ 3 is definitely lesser than max element

(iii)



$\Rightarrow$ 5 is definitely lesser than max element

(iv)



No such element

In any case, we can find one element that is less in just 2 seeks $\Rightarrow \theta(1)$.

End of Solution

Q.54 Consider the following Boolean expression:

$$F = (X + Y + Z)(\bar{X} + Y)(\bar{Y} + Z)$$

Which of the following Boolean expressions is/are equivalent to F?

(a) $X\bar{Y} + Y\bar{Z} + \bar{X}\bar{Y}\bar{Z}$ (b) $(\bar{X} + \bar{Y} + \bar{Z})(X + \bar{Y})(Y + \bar{Z})$

(c) $(X + \bar{Z})(\bar{Y} + \bar{Z})$ (d) $X\bar{Y} + \bar{Z}$

Ans. (a, c, d)

$$F = (X+Y+Z)(\overline{X}+Y)(\overline{Y}+Z)$$

$$\overline{F} = \overline{(X+Y+Z)(\overline{X}+Y)(\overline{Y}+Z)}$$

$$= \overline{(X+Y+Z)}+\overline{(\overline{X}+Y)}+\overline{(\overline{Y}+Z)} \quad \text{Using Demorgan's theorem}$$

$$= \overline{X}\,\overline{Y}\,\overline{Z}+X\overline{Y}+Y\overline{Z}$$

Option (a) is matching.

$$\overline{F} = \overline{Y}(\overline{X}\,\overline{Z}+X)+Y\overline{Z}$$

$$= \overline{Y}[(\underbrace{\cancel{X}+\overline{X}}_{1})]\,(X+\overline{Z})]+Y\overline{Z}$$

$$= \overline{Y}[X+\overline{Z}]+Y\overline{Z}$$

$$= X\overline{Y}+\overline{Y}\,\overline{Z}+Y\overline{Z}$$

$$= X\overline{Y}+\overline{Z}(\underbrace{\cancel{\overline{Y}}+Y}_{1})$$

$$= X\overline{Y}+\overline{Z}$$

Option (d) is matching.

$$X\overline{Y}+\overline{Z} = (X+\overline{Z})+(\overline{Y}+\overline{Z}) \quad \text{using distributing property.}$$

So option (c) is matching.

$\therefore$ So answer is (a), (c), (d).

End of Solution

Q.55 Consider the following representation of a number in IEEE 754 single-precision floating point format with a bias of 127.

S : 1 $\quad$ E : 10000001 $\quad$ F : 11110000000000000000000

Here S, E and F denote the sign, exponent and fraction components of the floating point representation.

The decimal value corresponding to the above representation (rounded to 2 decimal places) is __________.

Ans. (–7.75)

Value:

$(-1)^S\,(1.M) \times 2^{BE\text{-}Bias}$

$(-1)^1\,(1.11100\ldots) \times 2^{10000001\,-\,127}$

$-(1.1111) \times 2^{129\,-\,127}$

-1.1111×2^2

-111.11

$(-7.75)_{10}$

End of Solution

SECTION - A GENERAL APTITUDE

Q.1 If $\left(x-\frac{1}{2}\right)^2-\left(x-\frac{3}{2}\right)^2=x+2$, then the value of x is :

(a) 2
(b) 8
(c) 4
(d) 6

Ans. (c)

$$\left(x-\frac{1}{2}\right)^2-\left(x-\frac{3}{2}\right)^2 = x + 2$$

Using $a^2 - b^2 = (a + b)(a - b)$

$$\left(x-\frac{1}{2}+x-\frac{3}{2}\right)\left(x-\frac{1}{2}-x+\frac{3}{2}\right) = x + 2$$

$$(2x - 2) = x + 2$$

$$2x - x = 2 + 2$$

$$x = 4$$

End of Solution

Q.2 Listening to music during exercise improves exercise performance and reduces discomfort. Scientists researched whether listening to music while studying can help students learn better and the results were inconclusive. Students who needed external stimulation for studying fared worse while students who did not need any external stimulation benefited from music.

Which one of the following statements is the CORRECT inference of the above passage?

(a) Listening to music has a clear positive effect on learning in all students. Music has a positive effect only in some students who exercise.
(b) Listening to music has a clear positive effect on physical exercise. Music has a positive effect on learning only in some students.
(c) Listening to music has a clear positive effect both on physical exercise and on learning.
(d) Listening to music has no effect on learning and a positive effect on physical exercise.

Ans. (b)

"Only in some students" is the key in option (b) and that matches well with the given informations in the passage.

End of Solution

Q.3 Pen : Write : : Knife : _____

Which one of the following options maintains a similar logical relation in the above?

(a) Sharp (b) Cut

(c) Vegetables (d) Blunt

Ans. (b)

Pen is used to write and knife is used to cut.

End of Solution

Q.4 Gauri said that she can play keyboard ________ her sister.

(a) as worse as (b) as better as

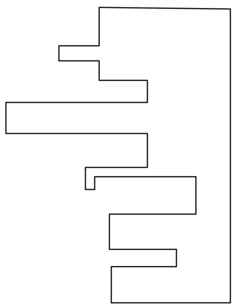
(c) as well as (d) as nicest as

Ans. (c)

(as – as) and (so – as) are used in positive degree of comparison only. Worse, better are comparative degree and nicest is superlative degree, which are not fit between as–as and so–as.

End of Solution

Q.5 What will be the remaining part to make it a rectangle?



(a) 
(b) 
(c) 
(d) 
Ans. (c)

Option (c) is flipped.

End of Solution

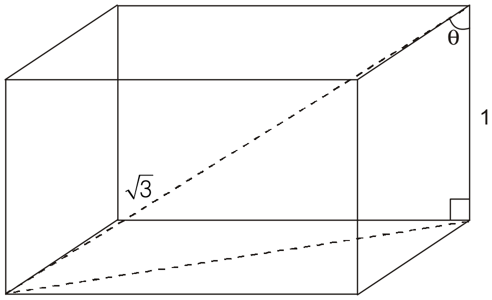
Q.6 If θ is the angle, in degrees, between the longest diagonal of the cube and any one of the edges of the cube, then $\cos\theta$ = ____.

(a) $\frac{1}{\sqrt{3}}$ (b) $\frac{1}{2}$

(c) $\frac{1}{\sqrt{2}}$ (d) $\frac{\sqrt{3}}{2}$

Ans. (a)

Angle of longest diagonal of cube with an edge of cube.



$$\cos\theta = \frac{\text{Base}}{\text{Hypotenuse}} = \frac{1}{\sqrt{3}}$$

End of Solution

Q.7 Six students P, Q, R, S, T and U, with distinct heights, compare their heights and make the following observations :

Observation I : S is taller than R.

Observation II : Q is the shortest of all.

Observation III : U is taller than only one student.

Observation IV : T is taller than S but is not the tallest.

The number of students that are taller than R is the same as the number of students shorter than _____.

(a) R (b) P

(c) S (d) T

Ans. (c)

$S > R$ ...(i)

Q is shortest and U is taller than only one. ...(ii)

$T > S$ ...(iii)

Hence, possible order is : $P > T > S > R > U > Q$.

$\because$ Number of students taller than R = 3.

$\therefore$ Number of students shorter than S = 3.

Hence, option (c) is the correct answer.

End of Solution

Q.8 The number of student in three classes is in the ratio 3 : 13 : 6. If 18 students are added to each class, the ratio changes to 15 : 35 : 21.
The total number of students in all the three classes in the beginning was:

(a) 88 (b) 110
(c) 66 (d) 22

Ans. (a)

3 : 13 : 6

Let $3k + 13k + 6k = n$

Now $+18 + 18 + 18$

$15 : 35 : 21$ ...(1)

$15y + 35y + 21y = 22k + 54$

$71y = 22k + 54$

Put value of k and satisfy

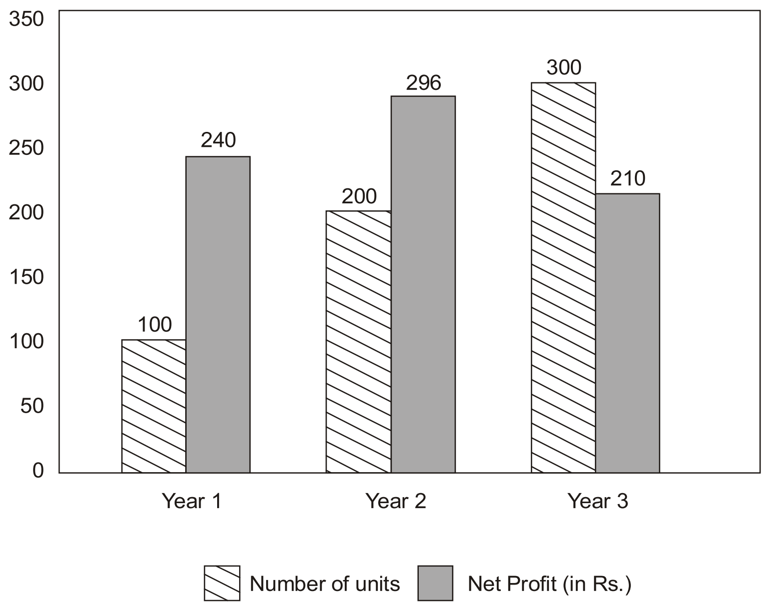
Here for $k = 4$

On putting $k = 4$ in equation (1)

$n = 88$

End of Solution

Q.9 The number of units of a product sold in three different years and the respective net profits are presented in the figure above. The cost/unit in year 3 was Rs. 1, which was half the cost/unit in year 2. The cost/unit in year 3 was one-third of the cost/unit in year 1. Taxes were paid on the selling price at 10%, 13% and 15% respectively for the three years. Net profit is calculated as the difference between the selling price and the sum of cost and taxes paid in that year.



The ratio of the selling price in Year 2 to the selling price in Year 3 is ________.

(a) 3 : 4 (b) 1 : 2
(c) 1 : 1 (d) 4 : 3

Ans. (d)

Cost/unit in year 3 = Rs. 1

Cost/unit in year 2 = Rs. 2

Cost/unit in year 1 = Rs. 3

Net Profit = S.P. – (Cost + Taxes)

In year 2, $296 = \text{S.P.} - (2 \times 200 + 0.13\ \text{S.P.})$

$\text{S.P.} = 800$

Selling price in year 2 = Rs. 800

In year 3, $210 = \text{S.P.} - (300 \times 1 + 0.15\ \text{S.P.})$

$210 = \text{S.P.} - 300 - 0.15\ \text{S.P.}$

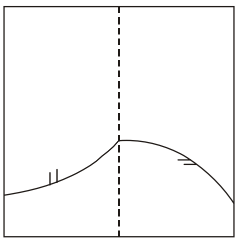
$$\text{S.P.} = \frac{210+300}{1-0.15}$$

Selling price in year 3 = Rs. 600

Hence, Required ratio = 800 : 600 = 4 : 3

End of Solution

Q.10 A transparent square sheet shown above is folded along the dotted line. The folded sheet will look like _____.



(a) 
(b) 
(c) 
(d) 
Ans. (a)

End of Solution

■■■■

SECTION - B TECHNICAL

Q.1 Consider a computer system with DMA support. The DMA module is transferring one 8-bit character in one CPU cycle from a device to memory through cycle stealing at regular intervals. Consider a 2 MHz processor. If 0.5% processor cycles are used for DMA, the data transfer rate of the device is _____ bits per second.

Ans. (80000)

$$y = 0.5\ \mu\text{sec (Transfer Time)}$$
$$x = \text{Preparation time}$$
$$\%\text{ time CPU blocked} = \left(\frac{y}{x+y}\right)\times 100$$
$$0.5 = \left(\frac{0.5\ \mu\text{sec}}{x+0.5\ \mu\text{sec}}\right)\times 100$$
$$0.005x + 0.0025 = 0.5$$
$$0.005x = 0.4975$$
$$x = 99.5\ \mu\text{sec}$$

(99.5 μsec + 0.5 μsec) Total time ———————— 8 bit

1 sec ———————— ?

$$= \frac{8\text{ bit}}{100\ \mu\text{sec}} = 80000\text{ bits/sec}$$

End of Solution

Q.2 Let $L \subseteq \{0, 1\}^*$ be an arbitrary regular language accepted by a minimal DFA with k states. Which one of the following languages must necessarily be accepted by a minimal DFA with k states?

(a) $\{0, 1\}^* - L$
(b) $L \cup \{01\}$
(c) $L.L$
(d) $L - \{01\}$

Ans. (a)

If L is accepted by a min DFA with k states, by exchanging final and non-final states, we can make a minimal DFA with k states which accepts $\{0, 1\}^* - L = \overline{L}$.

So, option (a) is true.

End of Solution

Q.3. Consider a computer system with multiple shared resource types, with one instance per resource type. Each instance can be owned by only one process at a time. Owning and freeing of resources are done by holding a global lock (L). The following scheme is used to own a resource instance:

```
function OwnResource (Resource R)
    Acquire lock L // a global lock
    if R is available then
        Acquire R
        Release lock L
    else
        if R is owned by another process P then
            Terminate P, after releasing all resources owned by P
            Acquire R
            Restart P
            Release lock L
        end if
    end if
end function
```

Which of the following choice(s) about the above scheme is/are correct?

(a) The scheme violates the mutual exclusion property.

(b) The scheme ensures that deadlocks will not occur.

(c) The scheme may lead to live-lock.

(d) The scheme may lead to starvation.

Ans. **(b, c, d)**

- Mutual exclusion is not violated.
- Also, there will be no deadlock because of forceful preemption of resources.
- This may lead to starvation if the process is keeps on coming and preempting each other like P_1 is preempted by P_2 and P_2 is preempted by P_3.
- Live-lock is also possible due to continuous preemption of resources.

For option (c) consider two processes P_1 and P_2 now P_1 enter the code acquires lock and resource.

Now P_2 enters the else part kills P_1 and acquire R and restart P_1.

Now P_1 again acquire lock and kills the process P_2 this continues creating a live lock scenario but there is ambiguity in the code since “Release R” is not written any where so ambiguity is regarding how the process will release Resource R. According to the code, the only way to release the resource is by getting killed.

End of Solution

Q.4 Consider the three-way handshake mechanism followed during TCP connection establishment between hosts P and Q. Let X and Y be two random 32-bit starting sequence numbers chosen by P and Q respectively. Suppose P sends a TCP connection request message to Q with a TCP segment having SYN bit = 1. SEQ number = X, and ACK bit = 0. Suppose Q accepts the connection request. Which one of the following choices represents the information present in the TCP segment header that is sent by Q to P?

(a) SYN bit = 1, SEQ number = Y, ACK bit = 1, ACK number = X + 1, FIN bit = 0
(b) SYN bit = 1, SEQ number = Y, ACK bit = 1, ACK number = X, FIN bit = 0
(c) SYN bit = 0, SEQ number = X + 1, ACK bit = 0, ACK number = Y, FIN bit = 1
(d) SYN bit = 1, SEQ number = X + 1, ACK bit = 0, ACK number = Y, FIN bit = 0

Ans. **(a)**

Q will send the SYN bit = 1 to the connection establishment.
Q seq number will be Y different from X.
ACK bit = 1 because sending the ACK.
ACK number = X + 1 (Next seq number id)
FIN bit = 0 (Because establishing the connection)

End of Solution

Q.5 For a given biased coin, the probability that the outcome of a toss is a head is 0.4. This coin is tossed 1,000 times. Let X denote the random variable whose value is the number of times that head appeared in these 1,000 tosses. The standard deviation of X (rounded to 2 decimal places) is ________.

Ans. **(15.49)**

$$n = 1000,\ p = 0.4,\ q = 0.6$$

It is a binomially distributed random variable.

So,
$$\text{S.D.} = \sqrt{npq} = \sqrt{1000 \times 0.4 \times 0.6} = \sqrt{240}$$
$$= 15.49$$

End of Solution

Q.6 Consider the following statements S_1 and S_2 about the relational data model :

S_1 : A relation scheme can have at most one foreign key.

S_2 : A foreign key in a relation scheme R cannot be used to refer to tuples of R.

(a) Both S_1 and S_2 are false.
(b) S_1 is true and S_2 is false.
(c) S_1 is false and S_2 is true.
(d) Both S_1 and S_2 are true.

Ans. **(a)**

S_1 : A relation scheme can have at most one foreign key.

e.g.

$$\begin{tikzcd} E_1(\underline{AB}) & R(\underline{AC}) \arrow[l, bend right, "f_k"'] \arrow[r, bend left, "f_k"] & E_2(\underline{CD}) \end{tikzcd}$$

More than 1 f_k also possible.

S_2 : A foreign key in a relational scheme R_1 cannot be used to refer to tuples of R.

f_k

Emp (<u>Eid</u>	ename	Sup)
e_1	A	E_1
e_2	A	E_1
e_3	A	E_2

e.g. Self referential relationship.

So, both S_1 and S_2 are false.

End of Solution

Q.7 The format of the single-precision floating-point representation of a real number as per the IEEE 754 standard is as follows:

sign	exponent	mantissa

Which one of the following choices is correct with respect to the smallest normalized positive number represented using the standard?

(a) exponent = 00000000 and maintissa = 00000000000000000000001
(b) exponent = 00000001 and maintissa = 00000000000000000000000
(c) exponent = 00000001 and maintissa = 00000000000000000000001
(d) exponent = 00000000 and maintissa = 00000000000000000000000

Ans. **(b)**

$$\left\{\begin{array}{c} \text{All 0's BE} \Rightarrow \text{Used for "0"} \\ \text{All 1's BE} \Rightarrow \text{Used for } (+\infty \text{ and } -\infty) \end{array}\right\}$$

End of Solution

Q.8 For a string w, we define w^R to be the reverse of w. For example, if w = 01101 then w^R = 10110. Which of the following languages is/are context-free?

(a) $\{wxw^RxR \mid w, x \in \{0, 1\}^*\}$ (b) $\{wxw^R \mid w, x \in \{0, 1\}^*\}$

(c) $\{^{ww^R}xx^R \mid w, x \in \{0, 1\}^*\}$ (d) $\{wxxw^Rw^R \mid w, x \in \{0, 1\}^*\}$

Ans. **(b, c, d)**

Option (a) : $\{wxw^Rx^R \mid w_1x \in \{0, 1\}^*\}$

By putting w as "$\in$" we will get $\{xx^R \mid x \in \{0, 1\}^*\}$ which still has string matching. So, this will not be regular. Similarly, by putting x as $\in$ it will be $\{ww^R \mid w \in \{0, 1\}^*\}$ which still has string matching and will not become regular.

So, we need to do string matching but alternate order string matching is not possible in PDA. So, it is a CSL. Option (a) is a CSL but not CFL.

Option (b) : $L = \{wxw^R \mid w, x \in \{0, 1\}^*\}$

By putting w as "$\in$" we get $\{x \mid x \in \{0, 1\}^*\} = (0 + 1)^*$

Since a subset of L is $(0 + 1)^*$, L itself must be $(0 + 1)^*$ which is regular and hence CFL. Option (b) is a CFL.

Option (c) : $\{ww^Rxx^R \mid w, x \in \{0, 1\}^*\}$

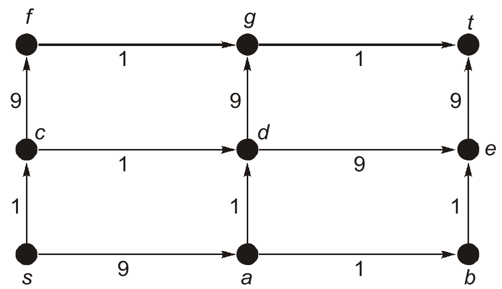
Here by putting x or w as $\in$, we cannot remove string matching. So, it is not regular. But it is CFL since in a NPDA we can push w, pop for w^R match it and then push x and pop for x^R and match it again and so this language is a CFL.

Option (d) : $\{wxx^Rw^R \mid w, x \in \{0, 1\}^*\}$

Here, also by putting w or x as $\in$, we cannot make it regular. NPDA can do this, push both w and x and then x^R pop and w^R pop and match. By push, push, pop, pop this can be accepted by NPDA. So, option (d) is CFL.

End of Solution

Q.9 In a directed acyclic graph with a source vertex s, the quality-score of a directed path is defined to be the product of the weights of the edges on the path. Further, for a vertex v other than s, the quality-score of v is defined to be the maximum among the quality-scores of all the paths from s to v. The quality-score of s is assumed to be 1.



The sum of the quality-scores of all the vertices in the graph shown above is ________.

Ans. **(929)**

Modify Dijkstra's Algo to get longest path in terms of quality scores (Use Max heap)

Algo:

1. Choose vertex u which is maximum quality score value.
   V is set of adjacency of u.
   for (each vertex (v))
   { if ($q[v] < q[u]$*cost (u, v)]
     {
       $q[v] = q[u]$ * cost(u, v)
       prev[v] = 4
2. Repeat (1) for each vertex exactly once.

Quality score (q):

1	0	0	0	0	0	0	0	0
1	9	9	1	9	81	9	81	729

Initially, let $q[v]$ = 0 or $-\infty$ (take smallest possible value)

Prev. :

–1	s	a	s	a	d	c	d	e

$S \Rightarrow \{a, c\}$ $\quad q(a) = 9,\ q(c) = 1$

$a \Rightarrow \{d, b\}$ $\quad q(d) = |ad|*q(a) = 1*9 = 9,\ q(b) = |ab|*q(a) = 1*9 = 9$

$b \Rightarrow \{e\}$ $\quad q(e) = |be|*q(b) = 1*9 = 9$

$d \Rightarrow \{e, g\}$ $\quad q(e) = |de|*q(d) = 9*9 = 81,\ q(g) = |dg|*q(d) = 9*9 = 81$

$e \Rightarrow \{t\}$ $\quad q(t) = |et|*q(e) = 9*81 = 729$

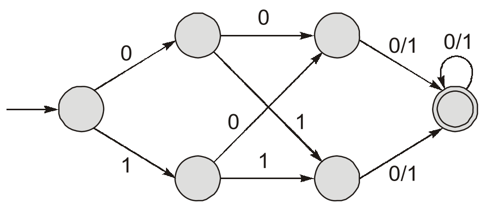
$g \Rightarrow \{t\}$ $\quad$ t already relaxed.

$c \Rightarrow \{f, d\}$ $\quad q(f) = |cf|*q(c) = 9*1 = 9$

$f \Rightarrow \{g\}$ $\quad$ g already relaxed

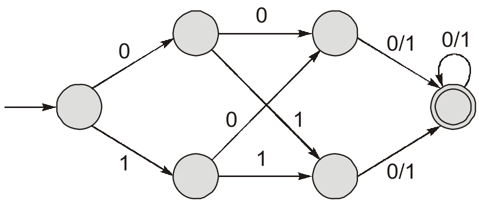
End of Solution

Q.10 Consider the following deterministic finite automation (DFA).



The number of strings of length 8 accepted by the above automation is ________.

Ans. **(256)**



The regular expression for $L(M)$ is $0(0+1)(0+1)(0+1)^* + 1(0+1)(0+1)(0+1)^*$

$$= (0+1)(0+1)(0+1)(0+1)^*$$

So, all strings of length ≥ 3 accepted.

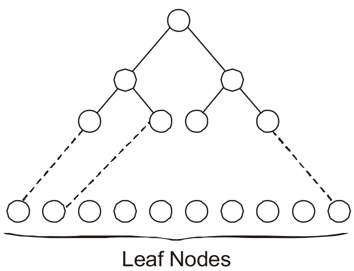
Therefore number of strings of length 8 is $2^8 = 256$.

End of Solution

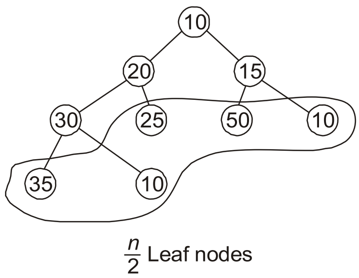
Q.11 Let H be a binary min-heap consisting of n elements implemented as an array. What is the worst case time complexity of an optimal algorithm to find the maximum element in H?

(a) $\Theta(\log n)$
(b) $\Theta(1)$
(c) $\Theta(n \log n)$
(d) $\Theta(n)$

Ans. **(d)**



OR



Maximum element is present somewhere in the leaf nodes.

$\therefore$ Find max in all leaf nodes from $\left(\left[\frac{n}{2}\right]+1\right)$.......$a[n]$

$\Rightarrow$ Number of comparisons $= \frac{n}{2} - 1 = \Theta(n)$

End of Solution

Q.12 In the context of compilers, which of the following is/are NOT an intermediate representation of the source program?

(a) Symbol table
(b) Three address code
(c) Control Flow Graph (CFG)
(d) Abstract Syntax Tree (AST)

Ans. (a)

Symbol table is a data structure which is used for storing the information about the variables. So, option (a) is correct.

There are three major categories of intermediate code representation.

Structural, linear and hybrid.

And CFG comes under the structural intermediate code representation.

End of Solution

Q.13 Consider the following two statements about regular languages:

S_1 : Every infinite regular language contains an undecidable language as a subset.

S_2 : Every finite language is regular.

Which one of the following choices is correct?

(a) Both S_1 and S_2 are true.
(b) Only S_2 is true.
(c) Only S_1 is true.
(d) Neither S_1 nor S_2 is true.

Ans. (a)

S_1 : Every infinite regular language contains an undecidable language as a subset.

S_2 : Every finite language is regular.

Clearly, S_2 is true, since for finite language, we can design FA by brute force, with a finite number of states.

Since, any language can be subset of an infinite language (No infinite language is closed under subset operation).

So, an infinite regular language can have any type of language as a subset including undecidable (non-REC) languages.

So, S_1 is also true. So, both S_1 and S_2 are true.

So, option (a) is correct.

End of Solution

Q.14 In an examination, a student can choose the order in which two questions (QuesA and QuesB) must be attempted.

- If the first question is answered wrong, the student gets zero marks.
- If the first questions is answered correctly and the second question is not answered correctly, the student gets the marks only for the first question.
- If both the questions are answered correctly, the student gets the sum of the marks of the two questions.

The following table shows the probability of correctly answering a question and the marks of the question respectively.

Question	Probability of answering correctly	Marks
QuesA	0.8	10
QuesB	0.5	20

Assuming that the student always wants to maximize her expected marks in the examination, in which order should she attempt the questions and what is the expected marks for that order (assume that the questions are independent)?

(a) First QuesA and then QuesB. Expected marks 14.
(b) First QuesB and then QuesA. Expected marks 22.
(c) First QuesB and then QuesA. Expected marks 14.
(d) First QuesA and then QuesB. Expected marks 16.

Ans. **(d)**

$X \rightarrow$ Random variable which represents total marks record.
$P(x) \rightarrow$ Probability of getting those marks.

X $\longrightarrow$ 0	10	20	30
$P(x) \longrightarrow$ 0.2 × 0.5	0.8 × 0.5	0.5 × 0.2	0.8 × 0.5
11	11	11	11
0.1	0.4	0.1	0.4
$\Sigma P(x) = 1$			

Now, if QuestionA is attempted first and it is correct.

Case-I:

$$E(x) = \Sigma(x) \cdot P(x)$$
$$= 0.4 \times 10 + 0.4 \times 30$$
$$= 4 + 12 = 16$$

Case-II:

If QuestionB is attempted first and is correct.

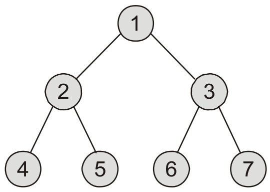
$$E(x) = \Sigma(x) \cdot P(x)$$
$$= 0.1\ (20) + 0.4\ (30)$$
$$= 2 + 12 = 14$$

So case-I is giving maximum expected marks.
Hence option (d) is correct.

End of Solution

Q.15 Consider a complete binary tree with 7 nodes. Let A denote the set of first 3 elements obtained by performing Breadth-First Search (BFS) starting from the root. Let B denote the set of first 3 elements obtained by performing Depth-First Search (DFS) starting from the root. The value of $|A - B|$ is ________.

Ans. **(1)**



Using BFS, $A = \{1, 2, 3\}$

Using DFS, $B = \{1, 2, 4\}$

$|A - B|$ = Number of elements which are in A but not in B is only element $\{3\}$

So only 1 element present.

End of Solution

Q.16 A data file consisting of 1,50,000 student-records is stored on a hard disk with block size of 4096 bytes. The data file is sorted on the primary key RollNo. The size of a record pointer for this disk is 7 bytes. Each student-record has a candidate key attributed called ANum of size 12 bytes. Suppose an index file with records consisting of two fields, ANum value and the record pointer to the corresponding student record, is built and stored on the same disk. Assume that the records of data file and index file are not split across disk blocks. The number of blocks in the index file is ________.

Ans. **(698)**

Index entries = Number of DB file record ($\because$ Dense index)

Block factor for Index,

$$(\text{Block factor})_{\text{Index}} = \left\lfloor \frac{4096}{19} \right\rfloor \text{ entries/block} = 215$$

$$\therefore \text{Number of Index blocks} = \left\lceil \frac{1{,}50{,}000}{215} \right\rceil \text{ blocks}$$

$$= \lceil 697.67 \rceil = 698 \text{ index blocks}$$

End of Solution

Q.17 Consider the following sets, where $n \geq 2$:

S_1 : Set of all $n \times n$ matrices with entries from the set $\{a, b, c\}$

S_2 : Set of all functions from the set $\{0, 1, 2, ..., n^2 - 1\}$ to the set $\{0, 1, 2\}$

Which of the following choice(s) is/are correct?

(a) There exists a surjection from S_1 to S_2.

(b) There does not exist a bijection from S_1 to S_2.

(c) There does not exist an injection from S_1 to S_2.

(d) There exists a bijection from S_1 to S_2.

Ans. **(a, d)**

$$|S_1| = 3^{n^2}$$

Since each of the n^2 entries in $n \times n$ matrix can be fills in 3 ways.

$$|S_2| = 3^{n^2}$$

Since $|\{0, 1, 2\}| = 3$ and $|\{0, 1, 2, ... n^2 - 1\}| = n^2)$

Now the theorem says A bijection $f_{A \to B}$ exists iff $|A| = |B|$.

Here $|S_1| = |S_2|$

So, there has to be a bijection from S_1 to S_2. So, option (d) is correct.

If bijection exists surely surjection also exists. So, option (a) is also correct.

Option (b) and (c) are incorrect.

End of Solution

Q.18 Suppose the following functional dependencies hold on a relation U with attributes P, Q, R, S and T:

$$P \to QR$$
$$RS \to T$$

Which of the following functional dependencies can be inferred from the above functional dependencies?

(a) $PS \to T$

(b) $P \to R$

(c) $R \to T$

(d) $PS \to Q$

Ans. **(a, b, d)**

1. $PS \to T$ $(PS)^+ = \{P, S, Q, R, T\}$
2. $P \to R$ $(P)^+ = \{P, Q, R\}$
3. $R \to T$ $(R)^+ = \{R\}$
4. $PS \to Q$ $(PS)^+ = \{P, S, Q, R, T\}$

End of Solution

Q.19 Which of the following statement(s) is/are correct in the context of CPU scheduling?

(a) The goal is to only maximize CPU utilization and minimize throughput.

(b) Turnaround time includes waiting time.

(c) Round-robin policy can be used even when the CPU time required by each of the processes is not known apriori.

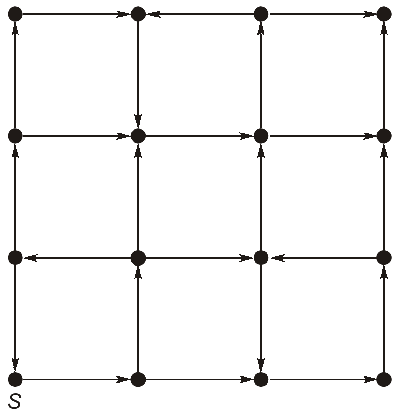
(d) Implementing preemptive scheduling needs hardware support.

Ans. **(b, c, d)**

- Goal is to maximize CPU utilization and maximize the throughput. So, statement (a) is false.
- Statement (b) is true, because turnaround time = completion time – arrival time and waiting time is included in this.
- Statement (c) is true because using time quantum, we can run the processes even if burst time is not known initially in round-robin.
- True for example, round robin scheduling requires hardware support which is timer.

End of Solution

Q.20 Consider the following directed graph:



Which of the following is/are correct about the graph?

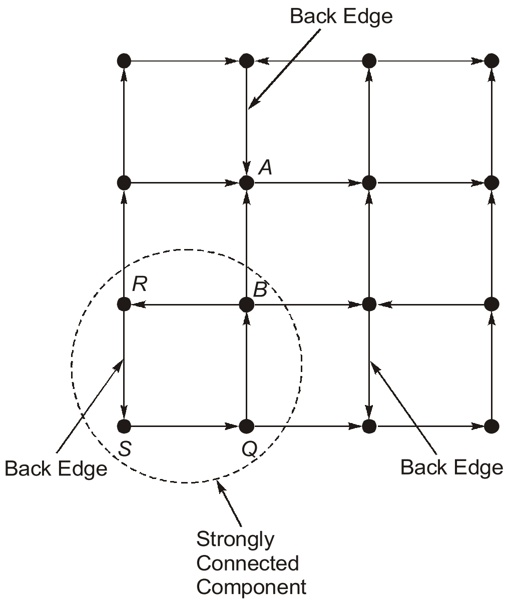
(a) The graph does not have a topological order.

(b) A depth-first traversal starting at vertex *S* classifies three directed edges as back edges.

(c) For each pair of vertices *u* and *v*, there is a directed path from *u* to *v*.

(d) The graph does not have a strongly connected component.

Ans. **(a, b)**



- As we can see there is cycle in given DAG. So, topological order is not possible.
- Statement (b) is also true.
- There is no path from A to B so statement (c) is false.
- In SQBR, it is strongly connected component. So, statement (d) is false.

End of Solution

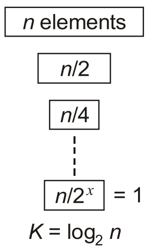
Q.21 What is the worst-case number of arithmetic operations performed by recursive binary search on a sorted array of size n?

(a) $\Theta(n)$ (b) $\Theta(n^2)$

(c) $\Theta\left(\sqrt{n}\right)$ (d) $\Theta(\log_2(n))$

Ans. **(d)**

Worst case is when the element not present in the sorted array.



Worst case occurrence relation is

$$T(n) = \begin{cases} T\left(\frac{n}{2}\right)+1, & n > 1 \\ 1, & n \leq 1 \end{cases}$$

$\therefore$ $\Theta(\log_2(n))$

End of Solution

Q.22 Consider a network using the pure ALOHA medium access control protocol, where each frame is of length 1,000 bits. The channel transmission rate is 1 Mbps (= 10^6 bits per second). The aggregate number of transmissions across all the nodes (including new frame transmissions and retransmitted frames due to collisions) is modelled as a Poisson process with a rate of 1,000 frames per second, Throughput is defined as the average number of frames successfully transmitted per second. The throughput of the network (rounded to the nearest integer) is ________.

Ans. **(135) [130 - 140]**

$$1 \text{ frames takes} = Tt = \frac{L}{B.W.}$$

$$\Rightarrow \quad \frac{1000}{10^6} = 1 \text{ millisec}$$

$$1000 \text{ frame } Tt = 1000 \times 1 \text{ millisec} = 1 \text{ sec}$$

In 1 sec, 1000 frames sends, which is 1 millisec per frame.

So, $G = 1$

Efficiency of Pure Aloha $(\eta) = G \times e^{-2G}$

where G = Number of requests per time slot willing to transmit

e = Mathematical constant approximately equal to 2.718

So, $\eta = 1 \times 2.718^{(-2 \times 1)} = 0.1353$

Therefore, in 1 sec 1000 frames = 0.1353 × 1000 = 135.3 (closest integer) ⇒ 135

Throughput ⇒ 135

End of Solution

Q.23 For a statement S in a program, in the context of liveness analysis, the following sets are defined :

$USE(S)$: the set of variables used in S

$IN(S)$: the set of variables that are live at the entry of S

$OUT(S)$: the set of variables that are live at the exit of S

Consider a basic block that consists of two statements, S_1 followed by S_2. Which one of the following statements is correct?

(a) $OUT(S_1) = USE(S_1) \cup IN(S_2)$

(b) $OUT(S_1) = IN(S_2) \cup OUT(S_2)$

(c) $OUT(S_1) = IN(S_2)$

(d) $OUT(S_1) = IN(S_1) \cup USE(S_1)$

Ans. **(c)**

In live variable analysis at any node, the set of variables live at just after the block are evaluated using the formula.

$$\text{OUT} = \cup \text{ IN (Successor nodes)}$$

So, the correct option is

$$\text{OUT } (S_1) = \text{IN } (S_2)$$

So, the correct option is (c).

End of Solution

Q.24 Let S be the following schedule of operations of three transactions T_1, T_2 and T_3 in a relational database system:

$$R_2(Y),\ R_1(X),\ R_3(Z),\ R_1(Y),\ W_1(X),\ R_2(Z),\ W_2(Y),\ R_3(X),\ W_3(Z)$$

Consider the statements P and Q below:

P : S is conflict-serializable.

Q : If T_3 commits before T_1 finishes, then S is recoverable.

Which one of the following choices is correct?

(a) P is true and Q is false.

(b) Both P and Q are false.

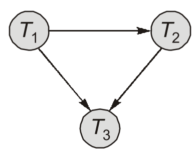
(c) Both P and Q are true.

(d) P is false and Q is true.

Ans. **(a)**

No cycle in precedence graph.

$\therefore$ Conflict serializable.



T_1	T_2	T_3
⋮	⋮	⋮
$W_1(X)$		
	$R_2(Z)$	
	$W_2(Y)$	
		$R_3(X)$
		$W_3(Z)$

T_2 is doing dirty read of updated X by T_1.

So, recoverability only possible if T_3 commits after commit/RB of T_1.

So, option (a) is correct.

End of Solution

Q.25 Consider the following ANSI C program:

```
#include <stdio.h>
#include <stdlib.h>
struct Node{
        int value;
        struct Node *next;};
int main( ) {
    struct Node *boxE, *head, *boxN; int index = 0;
    boxE = head = (struct Node *) malloc(sizeof(struct Node));
    head → value = index;
    for (index = 1; index <= 3; index++) {
        boxN = (struct Node *) malloc(sizeof(struct Node));
        boxE → next = boxN;
        boxN → value = index;
        boxE = boxN; }
    for (index = 0; index <= 3; index++) {
        printf("Value at index %d is %d\n", index, head → value);
        head = head → next;
        printf("Value at index %d is %d\n", index+1, head → value); } }
```

Which one of the statements below is correct about the program?

(a) Upon execution, the program creates a linked-list of five nodes.

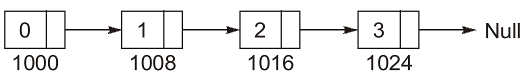
(b) It has a missing return which will be reported as an error by the compiler.

(c) It dereferences an uninitialized pointer that may result in a run-time error.

(d) Upon execution, the program goes into an infinite loop.

Ans. **(c)**

As we can see in the loop, i runs from 1 to 3. So, four nodes will be created because one node is already created with value 0.



When index = 3, then head value = 3

Head = Head → Next **(Now head will point to NULL)**

Head → Value [which is in print. So it will generate Run time Error].

So, option (c) is correct.

End of Solution

Q.26 If x and y are two decimal digits and $(0.1101)_2 = (0.8xy5)_{10}$, the decimal value of $x + y$ is __________.

Ans. **(3)**

$$(0.1101)_2 = 1 \times 2^{-1} + 1 \times 2^{-2} + 0 \times 2^{-3} + 1 \times 2^{-4}$$

$$= 0.5 + 0.25 + 0 + 0.0625 = (0.8125)_{10}$$

$$(0.8125)_{10} = (0.8xy5)_{10}$$

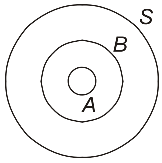
$$\therefore \quad x = 1,\ y = 2,\ x + y = 1 + 2 = 3$$

End of Solution

Q.27 Let S be a set consisting of 10 elements. The number of tuples of the form (A, B) such that A and B are subsets of S and $A \subseteq B$ is ________.

Ans. **(59049)**

The Venn diagram for this is



Now every element x in S has only 3 options. It can be $x \in A$ or $x \in B - A$ or $x \in S - B$. So the number of ways to choose A and B such that $A \subseteq B \subseteq S$ is 3^{10}.

End of Solution

Q.28 Consider the following ANSI C program:

```
int main( ) {
    Integer x;
    return 0;
}
```

Which one of the following phases in a seven-phase C compiler will throw an error?

(a) Syntax analyzer
(b) Machine dependent optimizer
(c) Semantic analyzer
(d) Lexical analyzer

Ans. **(*)**

[**Note:** Official answer key given by **IIT-Bombay** is option (c)]

End of Solution

Q.29 Assume a two-level inclusive cache hierarchy. L1 and L2, where L2 is the larger of the two. Consider the following statements.

S_1 : Read misses in a write through L1 cache do not result in writebacks of dirty lines to the L2.

S_2 : Write allocate policy must be used in conjunction with write through caches and no-write allocate policy is "used with writeback caches.

Which of the following statements is correct?

(a) S_1 is true and S_2 is true.
(b) S_1 is true and S_2 is false.
(c) S_1 is false and S_2 is true.
(d) S_1 is false and S_2 is false.

Ans. **(b)**

End of Solution

Q.30 A bag has r red balls and b black balls. All balls are identical except for their colours. In a trial, a ball is randomly drawn from the bag, its colour is noted and the ball is placed back into the bag along with another ball of the same colour. Note that the number of balls in the bag will increase by one, after the trial. A sequence of four such trials is conducted. Which one of the following choices gives the probability of drawing a red ball in the fourth trial?

(a) $\frac{r}{r+b}$

(b) $\frac{r}{r+b+3}$

(c) $\left(\frac{r}{r+b}\right)\left(\frac{r+1}{r+b+1}\right)\left(\frac{r+2}{r+b+2}\right)\left(\frac{r+3}{r+b+3}\right)$

(d) $\frac{r+3}{r+b+3}$

Ans. **(a)**

There are 10 favourable ways to calculate the probability of red ball in 4th trial.

(RFR)R ≈ R or (BRR)R ≈ 1 way or (RRR)R ≈ 3 ways or (BBR)R ≈ 3 ways

$$P(RRRR) = \frac{r}{r+b} \times \frac{r+1}{r+1+b} \times \frac{r+2}{r+2+b} \times \frac{+2}{r+3+b} \quad ...(1)$$

$$P(BBBR) = \frac{b}{r+b} \times \frac{b+1}{r+b+1} \times \frac{b+2}{r+b+2} \times \frac{r}{r+b+3} \quad ...(2)$$

$$P(RRBR) = \frac{3!}{2!} \times \frac{r}{r+b} \times \frac{r+1}{r+b+1} \times \frac{b}{r+b+2} \times \frac{r+2}{r+b+3} \quad ...(3)$$

$$P(BBRR) = \frac{3!}{2!} \times \frac{b}{r+b} \times \frac{b+1}{r+b+1} \times \frac{r}{r+b+2} \times \frac{r+1}{r+b+3} \quad ...(4)$$

Required probability = (1) + (2) + (3) + (4)

$$= \frac{r(r+1)(r+2)(r+3)+b(b+1)(b+2)r+3r(r+1)b(r+2)+3b(b+1)r(r+1)}{(r+b)(r+b+1)(r+b+2)(r+b+3)}$$

On solving it we get,

$$= \frac{r(r+1+b)}{(r+b)(r+b+1)} = \frac{r}{r+b}$$

End of Solution

Q.31 Consider the following multi-threaded code segment (in a mix of C and pseudo-code), invoked by two processes P_1 and P_2, and each of the processes spawns two threads T_1 and T_2:

int x = 0; // global
Lock L1; // global
main( ) {
  create a thread to execute foo( ); // Thread T_1
  create a thread to execute foo( ); // Thread T_2
  wait for the two threads to finish execution;
  print (x);}
foo( ) {
  int y = 0;
  Acquire L_1;
  $x = x + 1$;
  $y = y + 1$;
  Release L1;
  print (y); }

Which of the following statement(s) is/are correct?

(a) At least one of P_1 and P_2 will print the value of x as 4,
(b) Both P_1 and P_2 will print the value of x as 2.
(c) Both T_1 and T_2, in both the processes, will print the value of y as 1.
(d) At least one of the threads will print the value of y as 2.

Ans. **(b, c)**

P_1 and P_2 can spawn two threads T_1 and T_2.
int x = 0; //global
Lock L_1; //global
main( ) {
  foo( ); //Thread T_1
  foo( ); //Thread T_2
  print(x);
}
foo( ) {
a. int y = 0;
b. Acquire L_1;
c. $x = x + 1$;
d. $y = y + 1$;
  Release L_1;
  print(y);
}

- Let P_1 executed T_1 and in foo( ).

(a) $P_1 - T_1$ x $\boxed{\cancel{0}}$ 1
(b) $P_1 - T_1$

(c) $x = x + 1$ $(P_1 - T_1)$

.... Preempt T_1 of P_1.

Similarly, perform thread T_2 of P_1 then $x = 2$.

Now, if we similarly perform both threads of P_2 then x will be maximum 2.

Note: It is not mentioned about IPC or concurrent mechanism so the process will not shared the global variable. Each process will have its on own address space so the maximum value of x by each process can be 2 only.

Note: But as we know every foo call will have its own copy of variable y so y can not be more than 1 in any case.

End of Solution

Q.32 Suppose we want to design a synchronous circuit that processes a string of 0's and 1's. Given a string, it produces another string by replacing the first 1 in any subsequence of consecutive 1's by a 0. Consider the following example.

Input sequence : 00100011000011100

Output sequence : 00000001000001100

A Mealy Machine is a state machine where both the next state and the output are functions of the present state and the current input.

The above mentioned circuit can be designed as a two-state Mealy machine. The states in the Mealy machine can be represented using Boolean values 0 and 1. We denote the current state, the next state, the next incoming bit, and the output bit of the Mealy machine by the variables s, t, b and y respectively.

Assume the initial state of the Mealy machine is 0.

What are the Boolean expressions corresponding to t and y in terms of s and b?

(a) $t = b$

$y = s\bar{b}$

(b) $t = s + b$

$y = sb$

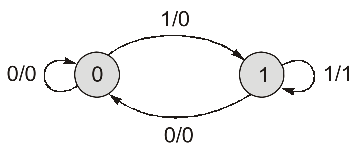
(c) $t = s + b$

$y = s\bar{b}$

(d) $t = b$

$y = sb$

Ans. (d)



PS	Next State t,	O/P y,
s	$b = 0$	$b = 1$
0	0,0	1,0
1	0,0	1,1

$t = \bar{s}b + sb = b$

$y = sb$

End of Solution

Q.33 Consider the following ANSI C code segment:

```
z = x + 3 + y → f1 + y → f2;
for (i = 0; i < 200; i = i + 2) {
    if (z > i) {
        p = p + x + 3;
        q = q + y → f1;
    } else {
        p = p + y → f2;
        q = q + x + 3;
    }
}
```

Assume that the variable y points to a struct (allocated on the heap) containing two fields $f1$ and $f2$, and the local variables x, y, z, p, q, and i are allotted registers. Common sub-expression elimination (CSE) optimization is applied on the code. The number of addition and dereference operations (of the form $y \rightarrow f1$ or $y \rightarrow f2$) in the optimized code, respectively, are :

(a) 303 and 2
(b) 403 and 102
(c) 203 and 2
(d) 303 and 102

Ans. (a)

$t_1 = y \rightarrow f_1$ (1 dereference)
$t_2 = y \rightarrow f_2$ (1 dereference)
$t_3 = x + 3$ (1 add)
$z = t_3 + t_1 + t_2$ (2 additions)

```
For (i = 0; i < 200; i+ = 2)
{
    if (z > i)
    {
        p = p + t3
        q = q + t1 (2 add)
    }
    else
    {
        p = p + p2
        q = q + t3 (2 add)
    }
}
```

If else condition $\Rightarrow$
Either if is executed (or) else is executed.
$\Rightarrow$ At any iteration 2 addition operations will be executed.

So, in loop the iterations are $\left(\dfrac{200}{2}\right) = 100$ times.

$\therefore$ In loop the number of additions $= 100 \times 2 = 200$ additions

$\therefore$ Total additions = 200 + 1 + 2 + 100 loop additions (inside for loop)
= 303

and 2 dereferences.

$\therefore$ Correct answer is 303 and 2 which is option (a).

End of Solution

Q.34 For two n-dimensional real vectors P and Q, the operation $s(P, Q)$ is defined as follows:

$$s(P, Q) = \sum_{i=1}^{n}(P[i].Q[i])$$

Let $\mathcal{L}$ be a set of 10-dimensional non-zero real vectors such that for every pair of distinct vectors $P, Q \in \mathcal{L}$, $s(P, Q) = 0$. What is the maximum cardinality possible for the set $\mathcal{L}$?

(a) 10
(b) 9
(c) 100
(d) 11

Ans. **(a)**

$\mathcal{L}$ is the set of 10-dimensional orthogonal vectors. So cardinality of $\mathcal{L} \leq 10$.

i.e., Maximum cardinality of $\mathcal{L}$ = 10.

So, option (a) is correct.

End of Solution

Q.35 The relation scheme given below is used to store information about the employees of a company, where empId is the key and deptId indicates the department to which the employee is assigned. Each employee is assigned to exactly one department.

emp(<u>empId</u>, name, gender, salary, deptId)

Consider the following SQL query:

```
select deptId, count(*)
from emp
where gender = “female” and salary > (select avg(salary) from emp)
group by deptId;
```

The above query gives, for each department in the company, the number of female employees whose salary is greater than the average salary of

(a) female employees in the department.
(b) employees in the department.
(c) female employees in the company.
(d) employees in the company.

Ans. (d)

emp	empId	Name	Gender	Salary	deptid
21K>20K	e_1	*X*	Female	210K	CS
	e_2	*Y*	Male	19K	CS
25K>20K	e_3	*XZ*	Female	25K	EC
	e_4	*YZ*	Male	14K	EC
21K>20K	e_5	*a*	Female	21K	CS

Average salary of all employees in the company.

O/P

deptid	count(*)
CS	2
EC	1

For each department, number of female employees whose salary is greater than average salary of employees in the company.

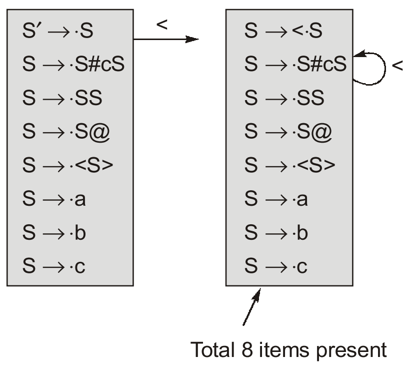
End of Solution

Q.36 Consider the following augmented grammar with {#, @, <, >, a, b, c} as the set of terminals.

S′ → S
S → S # cS
S → SS
S → S@
S → <S>
S → a
S → b
S → c

Let I_0 = CLOSURE($S' \rightarrow \bullet S$}). The number of items in the set GOTO(GOTO(I_0, <), <) is ________.

Ans. (8)



End of Solution

Q.37 Consider the following ANSI C function:

```
int SomeFunction(int x, int y)
{
    if ((x == 1)||(y == 1)) return 1;
    if (x == y) return x;
    if (x > y) return SomeFunction(x – y, y);
    if (y > x) return SomeFunction(x, y – x);
}
```

The value returned by SomeFunction(15, 255) is ________.

Ans. **(15)**

This function will keep on subtracting till both x and y becomes equal that is 15.

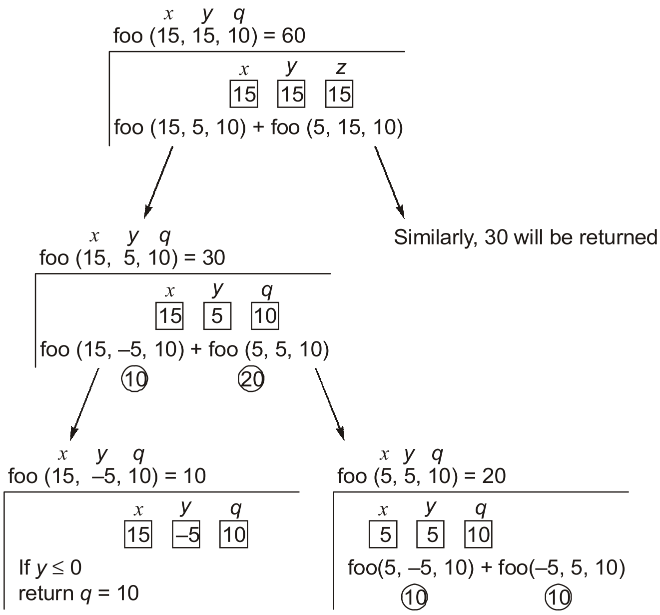
End of Solution

Q.38 Consider the following ANSI C program:

```
#include <stdio.h>
int foo(int x, int y, int q)
{
    if ((x <= 0) || (y <= 0))
        return q;
    if (x <= 0)
        return foo(x, y – q, q)
    if (y <= 0)
        return foo(x – q, y, q);
    return foo(x, y – q, q) + foo(x – q, y, q);
}
int main( )
{
    int r = foo(15, 15, 10);
    printf("%d", r);
    return 0;
}
```

The output of the program upon execution is _________.

Ans. (60)



End of Solution

Q.39 Consider a Boolean function $f(w, x, y, z)$ such that

$$f(w, 0, 0, z) = 1$$
$$f(1, x, 1, z) = x + z$$
$$f(w, 1, y, z) = wz + y$$

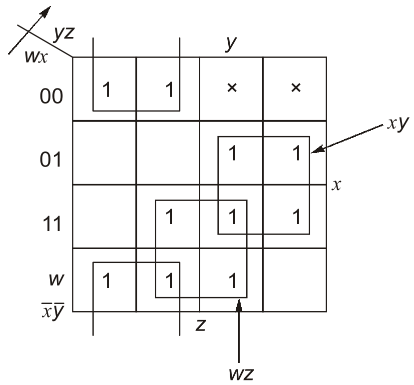
The number of literals in the minimal sum-of-products expression of f is ________.

Ans. (6)

$$f(w, 0\ 0, z) = 1 \quad ...(1)$$
$$f(1, x, 1, z) = x + z \quad ...(2)$$
$$f(w, 1, y, z) = wz + y \quad ...(3)$$

	wxyz	Eqn. 1	Eqn. 2	Eqn. 3	*f*
0	0000	1			1
1	0001	1			1
2	0010				×
3	0011				×
4	0100			0	0
5	0101			0	0
6	0110			1	1
7	0111			1	1
8	1000	1			1
9	1001	1			1
10	1010		0		0
11	1011		1		1
12	1100			0	0
13	1101			1	1
14	1110		1	1	1
15	1111		1	1	1

$$f(w, x, y, z) = \Sigma m(0, 1, 6, 7, 8, 9, 11, 13, 14, 15) + d(2, 3)$$



$\therefore$ $$f = \bar{x}\bar{y} + xy + wz$$

The number of literals in the minimal SOP expression is 6.

End of Solution

Q.40 Consider the cyclic redundancy check (CRC) based error detecting scheme having the generator polynomial $X^3 + X + 1$. Suppose the message $m_4m_3m_2m_1m_0 = 11000$ is to be transmitted. Check bits $c_2c_1c_0$ are appended at the end of the message by the transmitter using the above CRC scheme, The transmitted bit string is denoted by $m_4m_3m_2m_1m_0c_2c_1c_0$. The value of the checkbit sequence $c_2c_1c_0$ is

(a) 110 (b) 111
(c) 100 (d) 101

Ans. (c)

$$x^3 + x + 1 = 1011$$

```
1011 | 11000000 |
       1011
        1110
        1011
         1010
         1011
          100
```

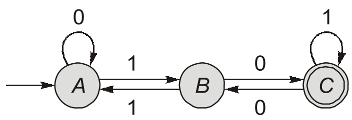
End of Solution

Q.41 Which of the following regular expressions represent(s) the set of all binary numbers that are divisible by three? Assume that the string e is divisible by three.

(a) (0*(1(01*0)*1)*)* (b) (0 +1(01*0)* 1)*
(c) (0 + 11 + 10(1 + 00)*01)* (d) (0 + 11 + 11(1 + 00)*00)*

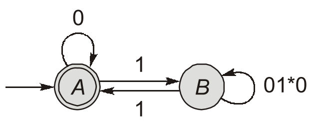
Ans. (a, b, c)

The DFA for accepting all binary strings divisible by 3 is given below:



where A is residue 0 state, B is residue 1 state and C is residue 2 state.

From this we get by deleting (c)



We get option (b) is correct (0 + 1(01*0)*1)*

Now option (a) = option (b)

because $(r^*s^*)^* = (r + s)^*$

So, option (a) is also correct.

Option (c) can be obtained by resolving the loop between B and C on "C" instead of on "B".

Option (c) is also correct.

Also note that whatever string option (b) can derive, option (c) also can derive. No counter example possible.

So, option (c) is also correct.

Option (d) (0 + 11 + 11(1 + 00)*00)* cannot derive “1001” which is accepted by machine.
So, option (d) is incorrect.
So, options (a), (b) and (c) are correct.

End of Solution

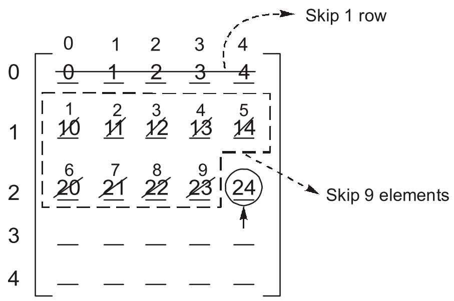
Q.42 Consider the following ANSI C program:

```
#include <stdio.h>
int main( ) {
    int arr[4] [5] ;
    int i, j;
    for (i = 0; i < 4; i++) {
        for (j = 0; j < 5; j++) {
            arr[i] [j] = 10 * i + j;
        }
    }
    printf("%d", * (arr[i] + 9));
    return 0;
}
```

What is the output of the above program?

(a) 24 (b) 20
(c) 14 (d) 30

Ans. **(a)**



int a[4][5]

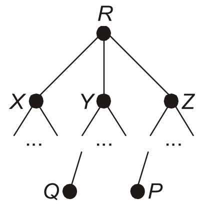
[*(a + 1) + 9]

It means skip one row and then skip 9 elements.

So, the resultant value is 24.

End of Solution

Q.43 Consider a computer network using the distance vector routing algorithm in its network layer. The partial topology of the network is as shown below.



The objective is to find the shortest-cost path from the router R to routers P and Q. Assume that R does not initially know the shortest routes to P and Q. Assume that R has three neighbouring routers denoted as X, Y and Z. During one iteration, R measures its distance to its neighbours X, Y and Z as 3, 2 and 5, respectively. Router R gets routing vectors from its neighbours that indicate that the distance to router P from routers X, Y and Z are 7, 6 and 5, respectively. The routing vector also indicates that the distance to router Q from routers X, Y and Z are 4, 6 and 8, respectively. Which of the following statement(s) is/are correct with respect to the new routing table of R, after updation during this iteration?

(a) The distance from R to Q will be stored as 7.
(b) The distance from R to P will be stored as 10.
(c) The next hop router for a packet from R to Q is Z.
(d) The next hop router for a packet from R to P is Y.

Ans. **(a, d)**

Given R gets the distance vector (3, 2, 5)

After the one iteration distance vector from X to P, Y to P, and Z to P is (7, 6, 5) respectively.

The distance vector from R to P via XYZ is $(3 + 7, 2 + 6, 5 + 5) = (10, 8, 10)$

So, take minimum distance from R to P which is 8 via Y.

After the iteration distance vector from X to Q, Y to Q, Z to Q is (4, 6, 8) respectively.

The distance vector from R to Q via XYZ is $(3 + 4, 2 + 6, 5 + 8) = (7, 8, 13)$.

So, take minimum distance from R to Q which is 7 via X.

End of Solution

Q.44 Let L_1 be a regular language and L_2 be a context-free language. Which of the following languages is/are context-free?

(a) $L_1 \cap \overline{L_2}$

(b) $\overline{\overline{L_1} \cup \overline{L_2}}$

(c) $L_1 \cup (L_2 \cup \overline{L_2})$

(d) $(L_1 \cap L_2) \cup (\overline{L_1} \cap L_2)$

Ans. **(b, c, d)**

$L_1 \to$ Regular

$L_2 \to$ CFL

1. $$L_1 \cap \overline{L_2} = \text{Reg} \cap \overline{\text{CFL}} = \text{Reg} \cap \overline{\text{CSL}}$$
$$= \text{Reg} \cap \text{CSL} = \text{CSL} \qquad \text{(need not be CFL)}$$

2. $$\overline{\overline{L_1} \cup \overline{L_2}} = L_1 \cap L_2 = \text{Reg} \cap \text{CFL} = \text{CFL}$$

3. $$L_1 \cup (L_2 \cup \overline{L_2}) = L_1 \cup \Sigma^* = \Sigma^* = \text{Regular and hence CFL}$$

4. $$(L_1 \cap L_2) \cup (\overline{L_1} \cap L_2) = (L_1 \cup \overline{L_1}) \cap L_2$$
$$= \Sigma^* \cap L_2$$
$$= L_2 = \text{CFL}$$

End of Solution

Q.45 For constants $a \geq 1$ and $b > 1$, consider the following recurrence defined on the non-negative integers:

$$T(n) = a \cdot T\left(\frac{n}{b}\right) + f(n)$$

Which one of the following options is correct about the recurrence $T(n)$?

(a) If $f(n)$ is $\Theta(n^{\log_b(a)})$, then $T(n)$ is $\Theta(n^{\log_b(a)})$.

(b) If $f(n)$ is $O(n^{\log_b(a) - e})$ for some $e > 0$, then $T(n)$ is $\Theta(n^{\log_b(a)})$.

(c) If $f(n)$ is $\dfrac{n}{\log_2(n)}$, then $T(n)$ is $\Theta(\log_2(n))$.

(d) If $f(n)$ is $n \log_2(n)$, then $T(n)$ is $\Theta(n \log_2(n))$.

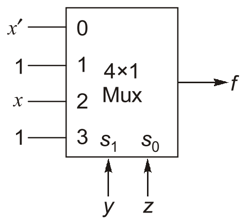
Ans. **(b)**

According to Standard Master Theorem, only option (b) is correct.

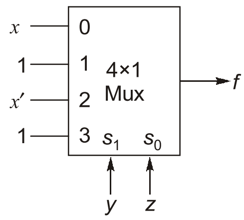
End of Solution

Q.46 Which one of the following circuits implements the Boolean function given below?
$f(x, y, z) = m_0 + m_1 + m_3 + m_4 + m_5 + m_6$, where m_i is the i^{th} minterm.

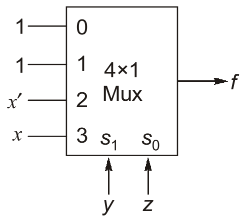
(a)



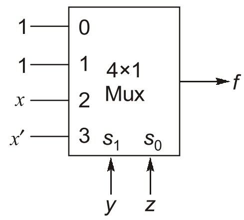
(b)



(c)



(d)



Ans. **(d)**

$$\Sigma(x, y, z) = m_0 + m_1 + m_3 + m_4 + m_5 + m_6$$
$$= \Sigma m(0, 1, 3, 4, 5, 6)$$

As per the given options, variable y is connected to multiplexer select input S_1 and z is connected to select input S_0.

	I_0 00	I_1 01	I_2 10	I_3 11
x 0	0	1	2	3
x 1	4	5	6	7
	1	1	x	$\bar{x}$

So, the correct option is (d).

End of Solution

Q.47 Consider the string abbccddeee. Each letter in the string must be assigned a binary code satisfying the following properties:

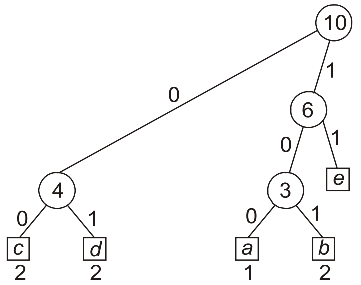
1. For any two letters, the code assigned to one letter must not be a prefix of the code assigned to the other letter.
2. For any two letters of the same frequency, the letter which occurs earlier in the dictionary order is assigned a code whose length is at most the length of the code assigned to the other letter.

Among the set of all binary code assignments which satisfy the above two properties, what is the minimum length of the encoded string?

(a) 23 (b) 25
(c) 21 (d) 30

Ans. (a)

Letters used in string :	*a*	*b*	*c*	*d*	*e*
Frequencies	1	2	2	2	3



Letters used in string:

∴ Minimum length of encoded string

= Sum frequency count using Huffman coding

= 1 * 3 + 2 * 3 + 2 * 2 + 2 * 2 + 3 * 2

= 3 + 6 + 4 + 4 + 6 = 23

End of Solution

Q.48 If the numerical value of a 2-byte unsigned integer on a little endian computer is 255 more than that on a big endian computer, which of the following choices represent(s) the unsigned integer on a little endian computer?

(a) 0x6665 (b) 0x0001

(c) 0x0100 (d) 0x4243

Ans. (a, c)

Option (a): In little endian 0x6665 on converting it to decimal = 26213

In big endian it will be 6566 on converting it to decimal = 25958

Now little endian – big endian = 26231 – 25958 = 255 which is correct.

Option (b): In little endian 0x0001 which is 1 in decimal in big endian 0x0100 which is greater than little endian in decimal. So this is incorrect option.

Option (c): Little endian = 0x0100 which is 256 in decimal and big endian = 0x0001 which is 1 in decimal an difference will be 255 hence this is also correct option.

Option (d): Little endian = 0x4243 and big endian = 0x4342, big endian value is greater than little endian so this is incorrect.

End of Solution

Q.49 Consider a pipelined processor with 5 stages. Instruction Fetch (IF), Instruction Decode (ID), Execute (EX), Memory Access (MEM), and Write Back (WB). Each stage of the pipeline, except the EX stage, takes one cycle. Assume that the ID stage merely decodes the instruction and the register read is performed in the EX stage. The EX stage takes one cycle for ADD instruction and two cycles for MUL instruction. Ignore pipeline register latencies. Consider the following sequence of 8 instructions:

ADD, MUL, ADD, MUL, ADD, MUL, ADD, MUL

Assume that every MUL instruction is data-dependent on the ADD instruction just before it and every ADD instruction (except the first ADD) is data-dependent on the MUL instruction just before it. The Speedup is defined as follows:

$$\text{Speedup} = \frac{\text{Execution time without operand forwarding}}{\text{Execution time with operand forwarding}}$$

The Speedup achieved in executing the given instruction sequence on the pipelined processor (rounded to 2 decimal places) is ________.

Ans. **(1.87) (1.87 - 1.88)**

With operand forwarding:

8 Instructions + 4 MUL Instruction × 1 Extra Cycle in Ex-stage

$\Rightarrow \quad n = 12$ (finite)

$\Rightarrow \quad K = 5$

$$ET_{\text{Pipe}} = (K + n - 1) \text{ Cycles}$$
$$= (5 + 12 - 1)$$
$$= 16 \text{ cycles}$$

Without operand forwarding :

- 8 Instructions + 4 MUL Instruction × 2 Stalls at ID stage for ADD O/P
  + 3 ADD Instruction × 3 Stalls at ID stage for MUL O/P
  + 1 MUL Instruction × 1 Extra Cycle in Ex-Stage (Last Instruction)

$\Rightarrow \quad n = 26$

$\Rightarrow \quad K = 5$

$$ET_{\text{Pipe}} = (K + n - 1) \text{ Cycles}$$
$$= (5 + 26 - 1) \text{ Cycles}$$
$$= 30 \text{ Cycles}$$

$$\therefore \quad S = \frac{30}{16} = 1.875$$

End of Solution

Q.50 Choose the correct choice(s) regarding the following propositional logic assertion S:

$$S : ((P \wedge Q) \to R) \to ((P \wedge Q) \to (Q \to R))$$

(a) S is a tautology.

(b) S is neither a tautology nor a contradiction.

(c) The antecedent of S is logically equivalent to the consequent of S.

(d) S is a contradiction.

Ans. **(a, c)**

$S : ((P \wedge Q) \to R) \to ((P \wedge Q) \to (Q \to R))$

$$\begin{aligned}
&\equiv (pq \to r) \to (pq \to (q \to r)) \\
&\equiv [(pq)' + r] \to [(pq)' + (q' + r)] \\
&\equiv [(pq)' + r]' + [(pq)' + q' + r] \\
&\equiv [pq \cdot r'] + [p' + q' + q' + r] \\
&\equiv pqr' + p' + q' + r \\
&\equiv (p + p')(qr' + p') + q' + r \\
&\equiv qr' + p' + q' + r \\
&\equiv (q + q')(r' + q') + p' + r \\
&\equiv r' + q' + p' + r \equiv r' + r + q' + p' \\
&\equiv 1 + q' + p' \equiv 1 \text{ (Tautology)}
\end{aligned}$$

So, S is a tautology.

So, option (a) is true.

Option (b) and (d) are false.

Option (c) antecedent of S is

$$\begin{aligned}
pq \to r &\equiv (pq)' + r \\
&\equiv p' + q' + r
\end{aligned}$$

The consequent of S is $pq \to (q \to r)$

$$\begin{aligned}
&\equiv (pq)' + q' + r \\
&\equiv p' + q' + q' + r \\
&\equiv p' + q' + r
\end{aligned}$$

So, Antecedent of $S \equiv$ Consequent of S

So, option (c) is also true.

End of Solution

Q.51 Suppose that P is a 4×5 matrix such that every solution of the equation $Px = 0$ is a scalar multiple of $[2 \ \ 5 \ \ 4 \ \ 3 \ \ 1]^T$. The rank of P is ________.

Ans. **(4)**

$P_{4 \times 5} \Rightarrow$ Number of unknowns (n) = 5 in $PX = 0$ ...(1)

Also it is given that Nullity $PX = 0$ is one, i.e., $N(P) = 1$.

Hence, Nullity = Number of unknowns – Rank

$$1 = 5 - \rho(P)$$

or $\rho(P) = 5 - 1 = 4$

End of Solution

Q.52 Consider a three-level page table to translate a 39-bit virtual address to a physical address as shown below:

←—— 39-bit virtual address ——→

Level 1 offset	Level 2 offset	Level 3 offset	Page offset
9 bits	9 bits	9 bits	12 bits

The page size is 4 KB (1 KB = 2^{10} bytes) and page table entry size at every level is 8 bytes. A process *P* is currently using 2 GB (1 GB = 2^{30} bytes) virtual memory which is mapped to 2 GB of physical memory. The minimum amount of memory required for the page table of P across all levels is ________ KB.

Ans. **(4108)**

←—— 39-bit virtual address ——→

Level 1 offset	Level 2 offset	Level 3 offset	Page offset
9 bits	9 bits	9 bits	12 bits

Since process P is using 2 GB physical memory and page size 2^{12} bytes.

So, Number of pages $= \dfrac{2^{31}}{2^{12}} = 2^{19}$

There are 2^9 entries per page table in 3^{rd} level.

So, we need $= \dfrac{2^{19}}{2^9} = 2^{10}$ page tables in 3^{rd} level

Now, it means 2^{10} entries in 2^{nd} level so number of page tables in 2^{nd} level

$$= \frac{2^{10}}{2^9} = 2 \text{ page table}$$

Now we have 2 entries in 1^{st} level hence we need only 1 page table in 1^{st} level.
Total number of page table $= 2^{10} + 2 + 1 = 1027$ per table
Each page table has 2^9 entries and each entry size is 8 bytes.
So, total size of page table in bytes $= 1027 \times 2^9 \times 8$ bytes $= 4108$ KB

End of Solution

Q.53 Suppose that $f : R \rightarrow R$ is a continuous function on the interval [–3, 3] and a differentiable function in the interval (–3, 3) such that for every x in the interval. $f'(x) \leq 2$. If $f(-3) = 7$, then then $f(3)$ is at most ________.

Ans. (19)

$$f'(x) \leq 2,\ f(-3) = 7$$

$$f'(x) = \frac{f(3)-7}{3-(-3)} \qquad \text{[Using Lagrange]}$$

$$f'(x) = \frac{f(3)-7}{6}$$

$$6f'(x) = f(3) - 7$$

$$f(3) = 6f'(x) + 7$$

Given max value of $f'(x)$ is 2

So, $f(3) = 6 \times 2 + 7$

$$f(3) = 19$$

End of Solution

Q.54 Let G be a connected undirected weighted graph. Consider the following two statements.

S_1 : There exists a minimum weight edge in G which is present in every minimum spanning tree of G.

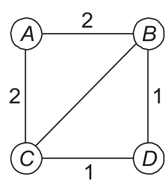
S_2 : If every edge in G has distinct weight, then G has a unique minimum spanning tree.

Which one of the following options is correct?

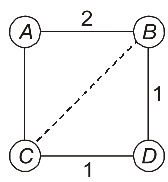
(a) S_1 is false and S_2 is true.
(b) Both S_1 and S_2 are false.
(c) S_1 is true and S_2 is false.
(d) Both S_1 and and S_2 are true.

Ans. (a)

S_1 : Consider the graph:



One of the possible MSTS can be:



But the minimum weight edge BC in G is not present. So, the S_1 is a false statement.

S_2 : In any undirected graph G, distinct edge weights means Unique MST.

So, the S_1 is false and S_2 is true.

Option (a) is correct.

End of Solution

Q.55 Consider a set-associative cache of size 2 KB (1 KB = 2^{10} bytes) with cache block size of 64 bytes. Assume that the cache is byte-addressable and a 32-bit address is used for accessing the cache. If the width of the tag field is 22 bits, the associativity of the ache is _________.

Ans. **(2)**

Set Associative Map

$$\text{CM Site} = 2 \text{ KB}$$
$$\text{Block Size} = 64 \text{ B}$$
$$\text{Number of lines} = \frac{2^{11}}{2^6} \Rightarrow 2^5(32)$$
$$\text{MM Adder} = 32 \text{ bit}$$
$$\text{Tag field size} = 22 \text{ bits}$$

Set associative CM adder format

32-bit

tag	S_o	w_o
22-bit	4-bit	$\log_2 64$ = 6 bit

$$\text{Set offset } (S_o) = 4 \text{ bit}$$
$$\therefore \quad \text{Number of sets } (S) = 2^4(16)$$
$$\text{Number of Sets } (S) = \frac{N}{P\text{-way}}$$
$$16 = \frac{32}{P\text{-way}}$$
$$\text{P-way} = \frac{32}{16} = 2$$

End of Solution

COMPUTER SCIENCE & INFORMATION TECHNOLOGY

Q. No. 1 to 25 Carry One Mark Each

1. Which one of the following kinds of derivation is used by LR parsers?

(A) Rightmost

(B) Rightmost in reverse

(C) Leftmost

(D) Leftmost in reverse

Answer: (B)

2. Consider the following C program:

```
#include <stdio.h>
int main(){
int arr[]={1,2,3,4,5,6,7,8,9,0,1,2,5}, *ip=arr+4;
printf("%d \n", ip[1]);
return 0;
}
```

The number that will be displayed on execution of the program is _________.

Answer: (6)

3. For $\Sigma = \{a,b\}$, let us consider the regular language $L = \{x \mid x = a^{2+3k} \text{ or } x = b^{10+12k}, k \geq 0\}$. Which one of the following can be a pumping length (the constant guaranteed by the pumping lemma) for L ?

(A) 5 (B) 24 (C) 9 (D) 3

Answer: (B)

4. Let U = {1, 2, …, n}. Let $A = \{(x, X) \mid x \in X, X \subseteq U\}$. Consider the following two statements on $|A|$.

I. $|A| = n2^{n-1}$

II. $|A| = \Sigma_{k=1}^{n} k\binom{n}{k}$

Which of the above statements is/are TRUE?

(A) Only II (B) Only I (C) Neither I nor II (C) Both I and II

Answer: (D)

5. A certain processor uses a fully associative cache of size 16 kB. The cache block size is 16 bytes Assume that the main memory is byte addressable and uses a 32-bit address. How many bits are required for the *Tag* and the *Index* fields respectively in the addresses generated by the processor?

(A) 28 bits and 4 bits

(B) 24 bits and 4 bits

(C) 24 bits and 0 bits

(D) 28 bits and 0 bits

Answer: (D)

6. Consider the grammar given below:

$$S \rightarrow Aa$$
$$A \rightarrow BD$$
$$B \rightarrow b \mid \varepsilon$$
$$D \rightarrow d \mid \varepsilon$$

Let a, b, d, and $ be indexed as follows:

a	b	d	$
3	2	1	0

Compute the FOLLOW set of the non-terminal B and write the index values for the symbols in the FOLLOW set in the descending order. (For example, if the FOLLOW set is {a, b. d, $}, then the Key should be 3210)

Answer: (31)

7. Let X be a square matrix. Consider the following two statements on X.

I. X is invertible

II. Determine of X is non-zero.

Which one of the following is TRUE?

(A) I implies II; II does not imply I

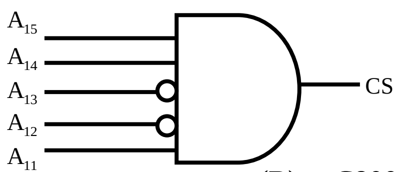
(B) I does not imply II; II does not imply I

(C) I and II are equivalent statements

(D) II implies I; I does not imply II

Answer: (C)

8. The chip select logic for a certain DRAM chip in a memory system design is shown below Assume that the memory system has 16 address lines denoted by A15 to A0. What is the range of addresses (in hexadecimal) of the memory system that can get enabled by the chip select (CS) signal?



(A) C800 to CFFF

(B) C800 to C8FF

(C) DA00 to DFFF

(D) CA00 to CAFF

Answer: (A)

9. Consider a sequence of 14 elements: A = {-5, -10, 6, 3, -1, -2, 13, 4, -9, -1, 4, 12, -3, 0]. The subsequence sum $S(i,j)=\sum_{k=i}^{j} A[k]$. Determine the maximum of $S(i,j)$, where $0 \le i \le j < 14$. (Divide and conquer approach may be used.)

Answer: (29)

10. An array of 25 distinct elements is to be sorted using quicksort. Assume that the pivot element is chosen uniformly at random. The probability that the pivot element gets placed in the worst possible location in the first round of partitioning (rounded off to 2 decimal places) is

Answer: (0.08)

11. The value of 3^{51} mod 5 is ________.

Answer: **(2)**

12. Consider the concurrent processes P1, P2 and P3 as shown below, which access a shared variable D that has been initialization to 100.

P1	P2	P3
:	:	:
:	:	:
D= D +20	D = D –50	D = D +10
:	:	:
:	:	:

The processes are executed on a uniprocessor system running a time-shared operating system. If the minimum and maximum possible values of D after the three processes have completed execution are X and Y respectively, then the value of Y–X is _________.

Answer: **(80)**

13. Compute $\lim_{x\to 3}\frac{x^4-81}{2x^2-5x-3}$

(A) 108/7

(B) 1

(C) 53/12

(D) Limit does not exist

Answer: **(A)**

14. Consider the following C program:

```
#include <stdio.h>
int jumble(int x, int y){
x=2*x+y;
```

```
return x;}
int main(){
int x=2, y=5;
y= jumble(y,x);
x= jumble(y,x);
printf("%d \n", x);
return 0;
}
```

The value printed by the program is _________.

Answer: (26)

15. Let G be an arbitrary group. Consider the following relations on G:

$R_1 : \forall a, b \in G, aR_1b$ if and only if $\exists g \in G$ such that $a = g^{-1}bg$

$R_2 : \forall a, b \in G, aR_2b$ if and only if $a = b^{-1}$

Which of the above is/are equivalence relation/relations?

(A) Neither R_1 nor R_2 (B) R_2 only

(C) R_1 only (D) R_1 and R_2

Answer: (C)

16. Consider the following two statements about database transaction schedules:

I. Strict two-phase locking protocol generates conflict serializable schedules that are also recoverable.

II. Timestamp-ordering concurrency control protocol with Thomas' Write Rule can generate view serializable schedules that are not conflict serializable.

Which of the above statements is/are TRUE?

(A) I only (B) II only (C) Neither I or II (D) Both I and II

Answer: (D)

17. Let G be an undirected complete graph on n vertices, where n > 2. Then, the number of different Hamiltonian cycles in G is equal to

(A) n! (B) $\frac{(n-1)!}{2}$ (C) 1 (D) (n–1)!

Answer: (B& C)

18. Which of the following protocol pairs can be used to send and retrieve e-mails (in that order)?

(A) SMTP, MIME (B) IMAP, POP3 (C) IMAP, SMTP (D) SMTP, POP3

Answer: (D)

19. The *following C program is executed on a Unix/Linux system:*

```
# include <unistd.h>
int main ( )
{
int i;
for (i = 0; i< 10; i++)
if (i % 2 = = 0) fork ( );
return 0;
}
```

The total number of child processes created is ________.

Answer: (31)

20. Consider Z = X – Y, where X, Y and Z are all in sign-magnitude form. X and Y are each represented in n bits. To avoid overflow, the representation of Z would require a minimum of:

(A) n bits (B) n + 1 bits (C) n + 2 bits (D) n – 1 bits

Answer: (B)

21. Which one of the following is NOT a valid identity?

(A) $(x \oplus Y) \oplus z = x \oplus (y \oplus z)$

(B) $x \oplus y = (xy + x'y')'$

(C) $(x + y) \oplus z = x \oplus (y + z)$

(D) $x \oplus y = x + y, \text{if } xy = 0$

Answer: (C)

22. Which one of the following statements is NOT correct about the B+ tree data structure used for creating an index of a relational database table?

(A) Key values in each node are kept in sorted order

(B) B+ Tree is a height-balanced tree

(C) Each leaf node has a pointer to the next leaf node

(D) Non-leaf nodes have pointers to data records

Answer: (D)

23. If L is a regular language over $\Sigma = \{a, b\}$, which one of the following languages is NOT regular?

(A) $\{ww^R \mid w \in L\}$

(B) $Prefix(L) = \{x \in \Sigma^* \mid \exists y \in \Sigma^* \text{ such that } xy \in L]$

(C) $L.L^R = \{xy \mid x \in L, y^R \in L\}$

(D) $Suffix(L) = \{y \in \Sigma^* \mid \exists x \in \Sigma^* \text{such that } xy \in L]$

Answer: (A)

24. In 16-bit 2's complement representation, the decimal number –28 is:

(A) 1000 0000 1110 0100

(B) 0000 0000 1110 0100

(C) 1111 1111 0001 1100

(D) 1111 1111 1110 0100

Answer: (D)

25. Two numbers are chosen independently and uniformly at random from the set $\{1, 2\ldots 13\}$. The probability (rounded off to 3 decimal places) that their 4-bit (unsigned) binary representations have the same most significant bit is __________.

Answer: (0.503)

Q. No. 26 to 55 Carry Two Marks Each

26. Consider the following relations P(X, Y, Z), Q(X, Y, T) and R(Y, V)

P		
X	**Y**	**Z**
X1	Y1	Z1
X1	Y1	Z2
X2	Y2	Z2
X2	Y4	Z4

Q		
X	**Y**	**T**
X2	Y1	2
X1	Y2	5
X1	Y1	6
X3	Y3	1

R	
Y	**V**
Y1	V1
Y3	V2
Y2	V3
Y2	V2

How many tuples will be returned by the following relational algebra query?

$\Pi_x\left(\sigma_{(P,Y=R,Y\wedge R.V=V2)}(P\times R)\right)-\Pi_x\left(\sigma_{(Q.Y=R.Y\wedge Q.T>2)}(Q\times R)\right)$. Answer ___________.

Answer: (1)

27. Which one of the following languages over $\Sigma=\{a,b\}$ is NOT a context free?

(A) $\{ww^R \mid w\in \{a,b\}^*\}$

(B) $\{wa^nw^Rb^n \mid w\in\{a,b\}^*, n\ \geq 0\}$

(C) $\{a^nb^i \mid i\in\ \{n,3n,5n\}, n\ \geq\ 0\}$

(D) $\{wa^nb^nw^R \mid w\in\{a,b\}^*, n\ \geq 0\}$

Answer: (B)

28. Consider the following c-program

```
#include <stdio.h>
int r(){
static int num=7;
return num --;}
int main(){
for (r();r();r())
printf("%d",r());
return 0;}
```

Which one of the following values will be displayed on execution of the programs?

(A) 52 (B) 630 (C) 41 (D) 63

Answer: (A)

29. There are n unsorted arrays: $A_1, A_2,....., A_n$. Assume that n is odd. Each of $A_1, A_2,....., A_n$ contains n distinct elements. There are no common elements between any two arrays. The worst-case time complexity of computing the median of the medians of $A_1, A_2,....., A_n$ is

(A) $O(n)$ (B) $O(n\log n)$ (C) $O(n^2)$ (D) $\Omega(n^2 \log n)$

Answer: (C)

30. A relational database contains two tables Student and Performance as shown below:

Student	
Roll_no.	**Student name**
1	Amit
2	Priya
3	Vinit
4	Rohan
5	Smita

Performance		
Roll_no.	**Subject_code**	**Marks**
1	A	86
1	B	95
1	C	90
2	A	89
2	C	92
3	C	80

The primary key of the student table is Roll_no. For the performance table, the columns Roll_no and Subject_code together form the primary key. Consider the SQL query given below:

Select S. Student_name, sum (P. Marks)

FROM Student S, Performance P

WHERE P. Marks >84

GROUP BY S.Student_name;

The number of rows returned by the above SQL query is________.

Answer: (5)

31. Consider the following C program

```
#include <stdio.h>
int main(){
float sum = 0.0, j = 1.0, i = 2.0;
while (i/j > 0.0625){
j= j+j;
sum = sum + i/j;
printf("%f\n", sum);
}
return 0;}
```

The number of times the variable sum will be printed, when the above program is executed, is _______.

Answer: (5)

32. Let the set of functional dependencies $F = \{QR \rightarrow S, R \rightarrow P, S \rightarrow Q\}$ hold on a relation schema X=(PQRS). X is not in BCNF. Suppose X is decomposed into two schemas Y and Z, where Y=(PR) and Z = (QRS).

Consider the two statements given below.

I. Both Y and Z are in BCNF

II. Decomposition of X into Y and Z is dependency preserving and lossless

Which of the above statements is/are correct?

(A) II only (B) Both I and II

(C) Neither I nor II (D) I only

Answer: (A)

33. The index node (inode) of a Unix-like file system has 12 direct, one single-indirect and one double-indirect pointers. The disk block size is 4 kB, and the disk block address is 32-bits long. The maximum possible file size is (rounded off to 1decimal place)______GB.

Answer: (4)

34. In a RSA cryptosystem, the value of the public modulus parameter n is 3007. If it is also known that $\phi(n) = 2880$, where $\phi()$ denotes Euler's Totient function, then the prime factor of n which is greater than 50 is_______.

Answer: (97)

35. Assume that in a certain computer, the virtual addresses are 64 bits long and the physical addresses are 48 bits long. The memory is word addressable. The page size is 8 kB and the word size is 4 bytes. The Translation Look-aside Buffer (TLB) in the address translation path has 128 valid entries. At most how many distinct virtual addresses can be translated without any TLB miss ?

(A) 256×2^{10} (B) 16×2^{10} (C) 4×2^{20} (D) 8×2^{20}

Answer: (A)

36. Consider the following grammar and the semantic actions to support the inherited type declaration attributes. Let X_1 ,X_2, X_3, X_4, X_5, and X_6be the placeholders for the non-terminals D, T, L or L_1 in the following table:

Production rule	Semantic action
$D \rightarrow TL$	X_1 .type = X_2.type
$T \rightarrow$ int	T.type = int
$T \rightarrow$ float	T.type = float

$L \rightarrow L1$, id	X_3.type = X_4.type addType(id.entry, X_5.type)
$L \rightarrow$ id	addType(id.entry, X_6.*typt)*

Which one of the following are the appropriate choices for X_1, X_2, X_3 and X_4?

(A) $X_1 = T$, $X_2 = L$, $X_3 = T$, $X_4 = L_1$

(B) $X_1 = L$, $X_2 = L$, $X_3 = L_1$, $X_4 = T$

(C) $X_1 = T$, $X_2 = L_1$, $X_3 = L_1$, $X_4 = L_1$

(D) $X_1 = L$, $X_2 = T$, $X_3 = L_1$, $X_4 = L$

Answer: (D)

37. Consider the following matrix

$$R = \begin{bmatrix} 1 & 2 & 4 & 8 \\ 1 & 3 & 9 & 27 \\ 1 & 4 & 16 & 64 \\ 1 & 5 & 25 & 125 \end{bmatrix}$$

The absolute value of the product of Eigen values of R is_______.

Answer: (12)

38. Consider the following C function.

```
void convert(int n){
    if(n<0)
    printf(%d",n);
    else {
    convert(n/2);
    printf("%d",n%2);
    }
}
```

Which one of the following will happen when the function `convert` is called with any positive integer n as argument?

(A) It will not print anything and will not terminate

(B) It will print the binary representation of n and terminate

(C) It will print the binary representation of n in the reverse order and terminate

(D) It will print the binary representation of n but will not terminate

Answer: (A)

39. Suppose Y is distributed uniformly in the open interval (1,6). The probability that the polynomial $3x^2+6xY+3Y+6$ has only real roots is ____________. (rounded off to 1 decimal place).

Answer: (0.8)

40. Let Σ be the set of all bijections from $\{1,\ldots,5\}$ to $\{1,\ldots,5\}$, where id denotes the identity function, i.e. id(j) = j, $\forall$j. let $\circ$ denote composition on functions. For a string

$x = x_1\, x_2 \ldots x_n \in \Sigma^n, n \geq 0$, let $\pi(x) = x_1 \circ x_2 \circ \ldots \circ x_n$.

Consider the language $L = \{x \in \Sigma^* \mid \pi(x) = id\}$. The minimum number of states in any DFA accepting L is______.

Answer: (120)

41. Let *T* be a full binary tree with 8 leaves. (A full binary' tree has every level full.) Suppose two leaves *a* and *b* of *T* are chosen uniformly and independently at random. The expected value of the distance between *a* and *b* in *T* (i.e., the number of edges in the unique path between *a* and *b)* is (rounded off to 2 decimal places) _________

Answer: (4.25)

42. Consider the following statements:

I. The smallest element in a max-heap is always at a leaf node

II. The second largest element in a max-heap is always a child of the root node

III. A max-heap can be constructed from a binary search tree m $\theta(n)$ time

IV. A binary search tree can be constructed from a max-heap in $\theta(n)$ time

Which of the above statements are TRUE?

(A) I, II and III (B) I, III and IV

(C) II, III and IV (D) I, II and IV

Answer: (A)

43. Consider three machines M, N, and P with IP address 100.10.5.2, 100.10.5.5, and 100.10.5.6. respectively. The subnet mask is set to 255.255.255.252 for all the three machines. Which one of the following is true?

(A) M, N, and P all belong to the same subnet

(B) Only M and N belong to the same subnet

(C) M, N, and P belong to three different subnets

(D) Only N and P belong to the same subnet

Answer: (D)

44. Consider the following sets:

S1. Set of all recursively enumerable languages over the alphabet {0,1}

S2. Set of all syntactically valid C programs

S3. Set of all languages over the alphabet {0,1}

S4. Set of all non-regular languages over the alphabet {0,1}

Which of the above sets are uncountable?

(A) S1 andS4 (B) S3 and S4 (C) S1 and S2 (D) S2andS3

Answer: (B)

45. Let *G* be any connected, weighted, undirected graph.

I. *G* has a unique minimum spanning tree, if no two edges of *G* have the same weight.

II. *G* has a unique minimum spanning tree, if, for every cut of G, there is a unique minimum-weight edge crossing the cut.

Which of the above two statements is/are TRUE?

(A) I only

(B) II only

(C) Neither I nor II

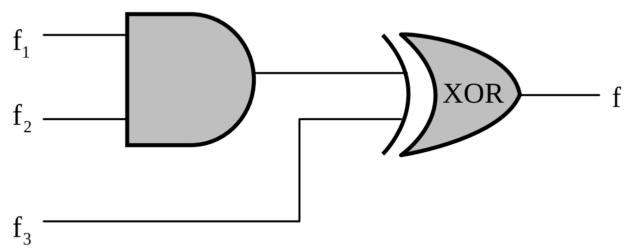
(D) Both I and II

Answer: (D)

46. Consider three 4-variable functions f_1, f_2, and f_3, which are expressed in sum-of-minterms as

$f_1 = \Sigma(0,2,5,8,14)$, $f_2\Sigma(2,3,6,8,14,15)$, $f_3 = \Sigma(2,7,11,14)$

For the following circuit with one AND gate and one XOR gate, the output function f can be expressed as:



(A) $\Sigma(7,8,11)$

(B) $\Sigma(2,14)$

(C) $\Sigma(2,7,8,11,14)$

(D) $\Sigma(0,2,3,5,6,7,8,11,14,15)$

Answer: (A)

47. Consider the following snapshot of a system running n concurrent processes. Process i is holding X_i instances of a resource R, $1 \le i \le n$. Assume that all instances of R are currently in use. Further, for all i, process i can place a request for at most Y_i additional instances of R while holding the X_i instances it already has. Of the n processes, there are exactly two processes p and q such that $Y_p = Y_q = 0$. which one of the following conditions guarantees that no other process apart from p and q can complete execution ?

(A) $X_p + X_q < \text{Min}\{Y_K \mid 1 \le K \le n, k \ne p, k \ne q\}$

(B) $\text{Min}(X_{p,} X_q) \le \text{Max}\{Y_k \mid 1 \le k \le n, k \ne p, k \ne q\}$

(C) $X_p + X_q < \text{Max}\{Y_k \mid 1 \le k \le n, k \ne p\ k \ne q\}$

(D) $\text{Min}(X_p, X_q) \ge \text{Min}\{Y_k \mid 1 \le k \le n, k \ne p, k \ne q\}$

Answer: (A)

48. A certain processor deploys a single-level cache. The cache block size is 8 words and the word size is 4 bytes. The memory system uses a 60-MHz clock. To service a cache miss, the memory controller first takes 1 cycle to accept the starting address of the block, it then takes 3 cycles to fetch all the eight words of the block, and finally transmits the words of the requested block at the rate of 1 word per cycle. The maximum bandwidth for the memory system when the program running on the processor issues a series of read operations is _____ $\times\ 10^6$ bytes/sec.

Answer: (160)

49. Consider the augmented grammar given below:

$$S' \rightarrow S$$
$$S \rightarrow < L > \ | \ id$$
$$L \rightarrow L, S \ | \ S$$

Let I_0 = CLOSURE ({[$S' \rightarrow \bullet S$]}). The number of items in the set GOTO (I_o,<) is:________

Answer: (5)

50. Consider the following four processes with arrival times (in milliseconds) and their length of CPU bursts (in milliseconds) as shown below:

Process	**P1**	**P2**	**P3**	**P4**
Arrival time	0	1	3	4
CPU burst time	3	1	3	Z

These processes are run on a single processor using preemptive shortest remaining time first scheduling algorithm. If the average waiting time of the processes is 1 millisecond, then the value of Z is ________.

Answer: (2)

51. Consider that 15 machines need to be connected in a LAN using 8-port Ethernet switches. Assume that these switches do not have any separate uplink port. The minimum number of switches needed is_________.

Answer: (3)

52. Consider the first order predicate formula ϕ :

$$\forall x\left[\left(\forall z\, z \mid x \Rightarrow \left((z=x) \vee (z=1)\right)\right) \Rightarrow \exists w\,(w > x) \wedge \left(\forall z\, z \mid w \Rightarrow \left((w=z) \vee (z=1)\right)\right)\right]$$

Here $'a \mid b'$ denotes that 'a divides b' where a and b are integers. Consider the following sets:

S1	$\{1, 2, 3, ..., 100\}$
S2	Set of all positive integers
S3	Set of all integers

Which of the above sets satisfy ϕ ?

(A) S1 and S3 (B) S1 and S2 (C) S2 and S3 (D) S1, S2 and S3

Answer: (C)

53. Consider the following C program

```
#include <stdio.h>
int main(){
int a[] = {2, 4, 6, 8, 10};
int i, sum = 0, *b = a + 4;
for (i = 0; i< 5; i+d+ )
sum = sum + (*b - i) - *(b - i);
printf("%d\n",sum);
return 0;
}
```

The output of the above C-program is _______.

Answer: (10)

54. Suppose that in an IP-over Ethernet network, a machine X wishes to find the MAC address of another machine Y in its subnet. Which one of the following techniques can be used for this?

(A) X sends an ARP request packet to the local gateway's MAC address which then finds the MAC address of Y and sends to X

(B) X sends an ARP request packet with broadcast IP address in its local subnet

(C) X sends an ARP request packet to the local gateway's IP address which then finds MAC address of Y and sends to X

(D) X sends an ARP request packet with broadcast MAC address in its local subnet

Answer: (D)

55. What is the minimum number of 2-input NOR gates required to implement a 4-variable function expressed in sum-of minterms form as $f = \Sigma(0,1,5,7,8,10,13,15)$? Assume that all the inputs and their complements are available.

Answer: (3)

Computer Science and Information Technology

Q. No. 1 – 25 Carry One Mark Each

1. Let $\oplus$ and $\odot$ denote the Exclusive OR and Exclusive NOR operations, respectively. Which of the following is NOT CORRECT?

(A) $\overline{P \oplus Q} = P \odot Q$

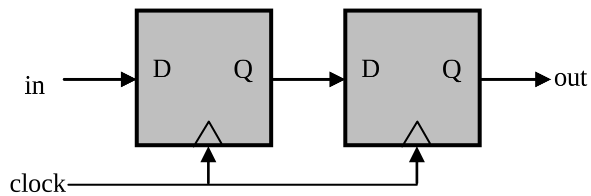
(B) $\overline{P} \oplus Q = P \odot Q$

(C) $\overline{P} \oplus \overline{Q} = P \oplus Q$

(D) $(P \oplus \overline{P}) \oplus Q = (P \odot \overline{P}) \odot \overline{Q}$

Answer: (D)

2. Consider the sequential circuit shown in the figure, where both flip-flops used are positive edge-triggered D flip-flops.



The number of states in the state transition diagram of this circuit that have a transition back to the same state on some value of "in" is ________.

Answer: (2)

3. Consider the following C program

```
#include<stdio.h>
struct Ournode{
    char x,y,z;
};
int main(){
    struct Ournode p =  {‘1’, '0', ‘a’ +2};
    struct Ournode *q = &p;
    printf("%c,  %c",   *((char*)q+1),   *((char*)q+2));
```

```
    return 0;
}
```

The output of this program is:

(A) 0, c (B) 0, a+2 (C) 0, a+2 (D) 0, c

Answer: (A)

4. In an Entity-Relationship (ER) model, suppose *R* is a many-to-one relationship from entity set *E1* to entity set *E2*. Assume that *E1*&*E2* participate totally in *R* and that the cardinality of *E1* is greater than the cardinality of *E2*.

Which one of the following is true about *R*?

(A) Every entity in *E1* is associated with exactly one entity in *E2*

(B) Some entity in *E1* is associated with more than one entity in *E2*

(C) Every entity in *E2* is associated with exactly one entity in *E1*

(D) Every entity in *E2* is associated with at most one entity in *E1*

Answer: (A)

5. The following are some events that occur after a device controller issues an interrupt while process *L* is under execution.

(P) The processor pushes the process status of *L* onto the control stack

(Q) The processor finishes the execution of the current instruction.

(R) The processor executes the interrupt service routine.

(S) The processor pops the process status of *L* from the control stack.

(T) The processor loads the new PC value based on the interrupt.

Which one of the following is the correct order in which the events above occur?

(A) QPTRS (B) PTRSQ (C) TRPQS (D) QTPRS

Answer: (A)

6. Let N be an NFA with n states. Let k be the number of states of a minimal DFA equivalent to N. Which one of the following is necessarily true?

(A) $k \geq 2^n$ (B) $k \geq n$ (C) $k \leq n^2$ (D) $k \leq 2^n$

Answer: (D)

7. Consider the following C program:

```
#include <stdio.h>
int counter = 0;
int calc(int a, int b){
    int c;
    counter++;
    if (b==3) return (a*a*a);
    else {
    c = calc(a,  b/3) ;
    return(c*c*c);
    }
}
int main(){
    calc (4,81);
    printf ("%d",  counter);
}
```

The output of this program is______

Answer: (4)

8. Consider the following processor design characteristics.

I. Register-to-register arithmetic operations only

II. Fixed-length instruction format

III. Hardwired control unit

Which of the characteristics above are used in the design of a RISC processor?

(A) I and II only (B) II and III only

(C) I and III only (D) I, II and III

Answer: (B)

9. The postorder traversal of a binary tree is 8, 9, 6, 7, 4, 5, 2, 3, 1. The inorder traversal of the same tree is 8, 6, 9, 4, 7, 2, 5, 1, 3. The height of a tree is the length of the longest path from the root to any leaf. The height of the binary tree above is_______

Answer: (4)

10. Consider a long-lived TCP session with an end-to-end bandwidth of 1 Gbps(=10^9 bits-per-second). The session starts with a sequence number of 1234. The minimum time (in seconds,rounded to the closet integer) before this sequence number can be used again is ___.

Answer: (34)

11. Consider a matrix $A = uv^T$ where $u = \begin{pmatrix} 1 \\ 2 \end{pmatrix}, v = \begin{pmatrix} 1 \\ 1 \end{pmatrix}$. Note that v^T denotes the transpose of v. The largest eigen value of A is _______.

Answer: (3)

12. Consider the following statements regarding the slow start phase of the TCP congestion control algorithm. Note that *cwnd* stands for the TCP congestion window and MSS denotes the Maximum Segment Size.

(i) The *cwnd* increases by 2 MSS on every successful acknowledgment

(ii) The *cwnd* approximately doubles on every successful acknowledgment

(iii) The*cwnd* increases by 1 MSS on every round trip time

(iv) The*cwnd* approximately doubles every round trip time

Which one of the following is CORRECT?

(A) Only (ii) and (iii) are true (B) Only (i) and (iii) are true

(B) Only (iv) is true (D) Only (i) and (iv) are true

Answer: (C)

13. Which one of the following statements is **FALSE**?

(A) Context-free grammar can be used to specify both lexical and syntax rules.

(B) Type checking is done before parsing.

(C) High-level Language programs can be translated to different Intermediate Representations.

(D) Arguments to a function can be passed using the program stack.

Answer: (B)

14. Match the following:

	Field		**Length in bits**
P.	UDP Header's Port Number	**I.**	48
Q.	Ethernet MAC Address	**II.**	8
R.	IPv6 Next Header	**III.**	32
S.	TCP Header's Sequence Number	**IV.**	16

(A) P-III, Q-IV, R-II, S-I (B) P-II, Q-I, R-IV, S-III

(C) P-IV, Q-I, R-II, S-III (D) P-IV, Q-I, R-III, S-II

Answer: (C)

15. Consider the following two tables and four queries in SQL.

Book (isbn, bname), Stock (isbn, copies)

Query 1:
```
SELECT B.isbn, S.copies
FROM Book B INNER JOIN Stock S
ON B.isbn=S.isbn:
```

Query 2:
```
SELECT B.isbn, S.copies
FROM Book B LEFT OUTER JOIN Stock S
ON B.isbn=S.isbn:
```

Query 3:
```
SELECT B, isbn, S.copies
FROM Book B RIGHT OUTER JOIN Stock S
ON B.isbn=S.isbn:
```

Query 4: SELECT B, isbn, S.copies

FROM Book B FULL OUTER JOIN Stock S

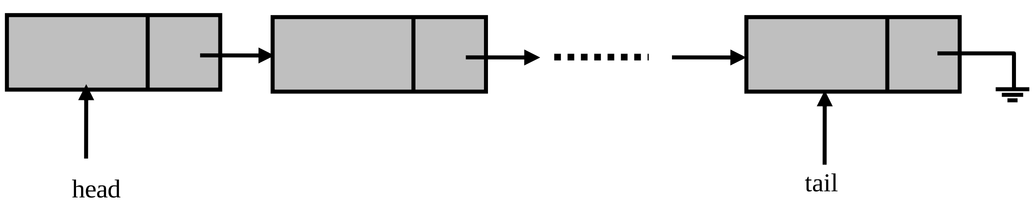
ON B.isbn=S.isbn:

Which one of the queries above is certain tohave an output that is a superset of the outputs of the other three queries?

(A) Query 1 (B) Query 2 (C) Query 3 (D) Query 4

Answer: (D)

16. A queue is implemented using a non-circular singly linked list. The queue has a head pointer and a tail pointer, as shown in the figure. Let *n* denote the number of nodes in the queue. Let `enqueue` be implemented by inserting a new node at the head and `dequeue` be implemented by deletion of a node from the tail.



Which one of the following is the time complexity of the most time-efficient implementation of *enqueue* and *dequeue*, respectively, for this data structure?

(A) $\theta(1), \theta(1)$ (B) $\theta(1), \theta(n)$ (C) $\theta(n), \theta(1)$ (D) $\theta(n), \theta(n)$

Answer: (B)

17. Let G be a finite group on 84 elements. The size of a largest possible proper subgroup of G is____.

Answer: (42)

18. The set of all recursively enumerable languages is

(A) closed under complementation.

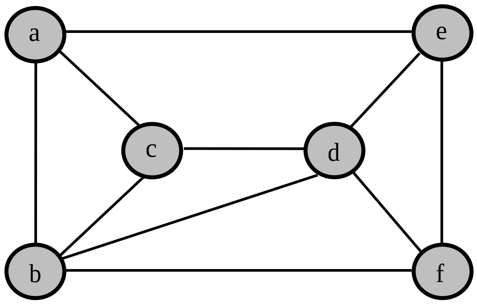
(B) closed under intersection.

(C) a subset of the set of all recursive languages.

(D) an uncountable set.

Answer: (B)

19. The chromatic number of the following graph is ______.



Answer: (3)

20. A 32-bit wide main memory unit with a capacity of 1 GB is built using 256M × 4-bit DRAM chips. The number of rows of memory cells in the DRAM chip is 2^{14}. The time taken to perform one refresh operation is 50 nanoseconds. The refresh period is 2 milliseconds. The percentage (rounded to the closest integer) of the time available for performing the memory read/write operations in the main memory unit is________

Answer: (60%)

21. Which one of the following is a closed form expression for the generating function of the sequence $\{a_n\}$, where $a_n = 2n+3$ for all n = 0, 1, 2…?

(A) $\frac{3}{(1-x)^2}$ (B) $\frac{3x}{(1-x)^2}$ (C) $\frac{2-x}{(1-x)^2}$ (D) $\frac{3-x}{(1-x)^2}$

Answer: (D)

22. Consider a system with 3 processes that share 4 instances of the same resource type. Each process can request a maximum of *K* instances. Resource instances can be requested and released only one at a time. The largest value of *K* that will always avoid deadlock is _____.

Answer: (2)

23. Consider a process executing on an operating system that uses demand paging. The average time for a memory access in the system is *M* units if the corresponding memory page is available in memory and *D* units if the memory access causes a page fault. It has been experimentally measured that the average time taken for a memory access in the process is *X* units.

Which one of the following is the correct expression for the page fault rate experienced by the process?

(A) $(D-M)/(X-M)$ (B) $(X-M)/(D-M)$

(C) $(D-X)/(D-M)$ (D) $(X-M)/(D-X)$

Answer: (B)

24. Two people P and Q decide to independently roll two identical dice, each with 6 faces numbered 1 to 6. The person with the lower number wins. In case of a tie, they roll the dicerepeatedly until there is no tie. Define a trial as a throw of the dice by P and Q. Assume that all 6 numbers on each dice are equi-probable and that all trials are independent. Theprobability (rounded to 3 decimal places) that one of them wins on the third trial is ______.

Answer: (0.023)

25. The value of $\int_0^{\pi/4} x\cos\left(x^2\right)dx$ correct to three decimal places (assuming that $\pi = 3.14$) is _____.

Answer: (0.29)

26. Consider Guwahati *(G)* and Delhi *(D)* whose temperatures can be classified as high*(H)*, medium *(M)* and low *(L)*. Let $P(H_G)$ denote the probability that Guwahati has high temperature. Similarly $P(M_G)$ *and* $P(L_G)$ denotes the probability of Guwahati having medium and low temperatures respectively. Similarly, we use $P(H_D), P(M_D)$ *and* $P(L_D)$ for Delhi.

The following table gives the conditional probabilities for Delhi's temperatures given Guwahati's temperature

	H_D	M_D	L_D
H_G	0.40	0.48	0.12
M_G	0.10	0.65	0.25
L_G	0.01	0.50	0.49

Consider the first row in the table above. The first entry denotes that if Guwahati has high temperature (H_G) then probability of Delhi also having a high temperature (H_D) is 0.40 i.e., $P(H_D/H_G) = 0.40$. Similarly, the next two entries are $P(M_D/H_G)$=0.48 and $P(L_D/H_G) = 0.12$ Similarly for the other rows.

If it is known that $P(H_G)=0.2, P(M_G)=0.5\ and P(L_G)=0.3,$ then the probability (correct to two decimal places) that Guwahati has high temperature given that Delhi has high temperature is ________.

Answer: (0.6)

27. Assume that multiplying a matrix $G_1$of dimension $p \times q$ with another matrix G_2 of dimension $q \times r$ requires pqrscalar multiplications. Computing the product of n matrices $G_1G_2G_3...G_n$can be done by parenthesizing in different ways. Define $G_i\ G_{i+1}$as an explicitly computed pair for a given paranthesization if they are directly multiplied. For example, in the matrix multiplication chain $G_1G_2G_3G_4G_5G_6$using parenthesization$(G_1(G_2G_3))(G_4(G_5G_6)))$. *G2G3* and *G5G6* are the only explicitly computed pairs.

Consider a matrix multiplication chain $F_1F_2F_3F_4F_5$, where matrices F_1, F_2, F_3, $F_4$and $F_5$are of dimensions 2× 25, 25×3. 3×16. 16×1 and 1×1000. respectively, In the parenthesization of $F_1F_2F_3F_4F_5$that minimizes the total number of scalar multiplications, the explicitly computed pairs is are

(A) $F_1F_2$and F_3F_4only
(B) F_2F_3 only
(C) F_3F_4only
(D) $F_1F_2$and F_4F_5only

Answer: (C)

28. The instruction pipeline of a RISC processor has the following stages: Instruction Fetch (IF), Instruction Decode (ID), Operand Fetch (OF), Perform Operation (PO) and Write back (WB). The IF, ID, OF and WB stages take 1 clock cycle each for every instruction. Consider a sequence of 100 instructions. In the PO stage. 40 instructions take 3 clock cycles each. 35 instructions take 2 clock cycles each, and the remaining 25 instructions take 1 clock cycle each. Assume that there are no data hazards and no control hazards. The number of clock cycles required for completion of execution of the sequence of instructions is______.

Answer: (219)

29. Consider the following solution to the producer-consumer synchronization problem. The shared buffer size is *N*. Three semaphores *empty*. *full* and *mutex* are defined with respective initial values of 0. *N* and 1. Semaphore *empty* denotes the number of available slots in thebuffer, for the consumer to read from. Semaphore *full* denotes the number of available slots in the buffer. for the producer to write to. The placeholder variables. denoted by `P, Q, R,and S.` in the code below can be assigned either *empty* or *full*. The valid semaphore operations arc: `wait ()` and `signal().`

Producer:	Consumer:

`do {`
`wait(P);`
`wait(mutex);`
`//Add item to buffer`
`signal (mutex);`
`signal (Q);`
`}while(1);`
	`do {`
	`wait(R);`
	`wait(mutex);`
	`//Consume item to buffer`
	`signal (mutex);`
	`signal (S);`
	`}while(1) ;`

Which one of the following assignments to `P`, `Q`, `R` and `S` will yield the correct solution?

(A) `P`:full, `Q`: full, `R`: empty, `S`: empty

(B) `P`:empty, `Q`: empty, `R`: full, `S`: full

(C) `P`:full, `Q`: empty, `R`: empty, `S`: full

(D) `P`:empty, `Q`: full, `R`: full, `S`: empty

Answer: (C)

30. A lexical analyzer uses the following patterns to recognize three tokens T_1. T_2. and T_3 over the alphabet $\{a, b, c\}$.

$T1$: $a?(b|c)*a$

T_2: $b?(a|c)*b$

T_3: $c?(b|a)*c$

Note that 'x? means 0 or 1 occurrence of the symbol *x* Note also that the analyzer outputs the token that matches the longest possible prefix.

It the string *bbaacabc*is processed by the analyzer, which one of the following is the sequence of tokens it outputs?

(A) $T_1T_2T_3$ (B) $T_1T_1T_3$ (C) $T_2T_1T_3$ (D) T_3T_3

Answer: (D)

31. Consider a matix P whose only eigenvectors are the multiples of $\begin{bmatrix} 1 \\ 4 \end{bmatrix}$.

Consider the following statements:

(I) P does not have an inverse

(II) P has a repeated eigenvalue

(III) P cannot be diagonalized

Which one of the following options is CORRECT?

(A) Only I and III are necessarily true (B) Only II is necessarily true

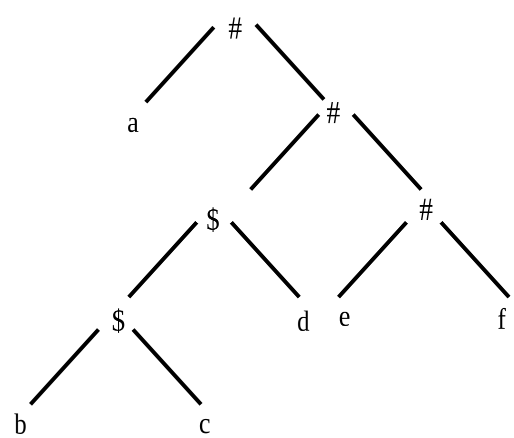
(C) Only I and II are necessarily true (D) Only II and III are necessarily true

Answer: (D)

32. A processor has 16 integer registers (R0, R1….R15) and 64 floating point registers (F0,Fl…….F63). It uses a 2-byte instruction format. There are four categories of instructions: Type-1, Type-2, Type-3, and Type-4. Type-1 category consists of four instructions, each with 3 integer register operands (3Rs). Type-2 category consists of eight instructions, each with 2 floating point register operands (2Fs). Type-3 category consists of fourteen instructions, each with one integer register operand and one floating point register operand (1R+1F). Type-4 category consists of X instructions, each with a floating point register operand (IF).The maximum value of N is___________.

Answer: (32)

33. Consider the following parse tree for the expression a#bcd#e#f. involving two binary operators $ and #.



Which one of the following is CORRECT for the given parse tree?

(A) $ has higher precedence and is left associative; # is right associative

(B) # has higher precedence and is left associative; $ is right associative

(C) $ has higher precedence and is left associative; # is left associative

(D) # has higher precedence and is right associative; $ is left associative

Answer: (A)

34. Consider the minterm list form of a Boolean function *F* given below:

$$F(P,Q,R,S)=\sum m(0,2,5,7,9,11)+d(3,8,10,12.14)$$

Here, m denotes a minterm and d denotes a don't care term. The number of essential prime implicants of the function F is _______

Answer: (3)

35. Consider the relations $r(A,B)$ and $s(B,C)$, where s.B is a primary key and r.B is a foreign key referencing s. B. Consider the query

$$Q: r \bowtie (\sigma_{B<5}(s))$$

Let LOJ denote the natural left outer-join operation. Assume that r and s contain no null values.

Which one of the following queries is NOT equivalent to Q?

(A) $\sigma_{B<5}(r \bowtie s)$

(B) $\sigma_{B<5}(r \text{LOJ} s)$

(C) $r\,\text{LOJ}(\sigma_{B<5}(s))$

(D) $\sigma_{B<5}(r)\,\text{LOJ}\,s$

Answer: (C)

36. Consider the following C code. Assume that unsigned long int type length is 64 bits.

```
unsigned long int fun(unsigned long int n){
unsigned long int i,   j = 0,   sum = 0;
    for   (i = n;  i> 1;   i = i/2)
                j++;
    for( ;   j > 1;    j = j/2)   sum++;
    return(sum);
    }
```

The value returned when we call fun with the input 2^{40} is

(A) 4 (B) 5 (C) 6 (D) 40

Answer: (B)

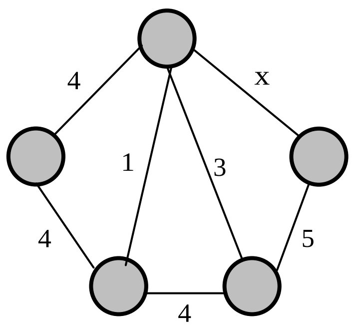
37. The size of the physical address space of a processor is 2^P bytes. The word length is 2^W bytes. The capacity of cache memory is 2^N bytes. The size of each cache block is 2^M words. For a K-way set-associative cache memory, the length (in number of bits) of the tag field is

(A) $P - N - \log_2 K$ (B) $P - N + \log_2 K$

(C) $P - N - M - W - \log_2 K$ (D) $P - N - M - W + \log_2 K$

Answer: (B)

38. Consider the following undirected graph G:



Choose a value for x that will maximize the number of minimum weight (MWSTs) of G. The number of MWSTs of G for this value of x is____________.

Answer: (4)

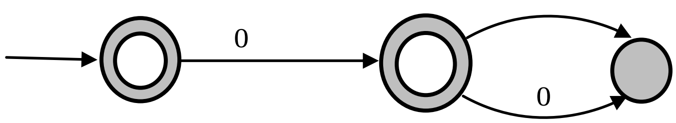
39. Given a language L, define L^i as follows:

$$L^0 = \{\varepsilon\}$$

$$L^i = L^{i-1}.L \text{ for all } i>0$$

The order of a language L is defined as the smallest k such that $L^k = L^{k+1}$.

Consider the language L_1(over alphabet 0) accepted by the following automaton.



The order *of* $L_1$is

Answer: (2)

40. Let *N* be the set of natural number.

Consider the following sets

P: Set of Rational numbers (positive and negative)

Q: Set of functions from {0, 1} to N

R: Set of functions from N to {0, 1}

S: Set of finite subset of N.

Which of the sets above are countable?

(A) *Q* and *S* only (B) *P* and *S* only (C) *P* and *R* only (D) *P*, *Q* and *S* only

Answer: (D)

41. Consider a storage disk with 4 platters (numbered as 0.1. 2 and 3). 200 cylinders (numbered as 0. 1. .... 199). and 256 sectors per track (numbered as 0. 1. ... 255). The following 6 disk requests of the form [sector number. cylinder number. platter number] are received by the disk controller at the same time:

[120, 72, 2], [180, 134, 1], [60, 20, 0], [212, 86, 3], [56, 116, 2],[118, 16, 1]

Currently the head is positioned at sector number 100 of cylinder 80. and is moving: towardshigher cylinder numbers. The average power dissipation in moving the head over 100 cylinders is 20 milliwatts and for reversing the direction of the head movement once is 15milliwatts. Power dissipation associated with rotational latency and switching of head between different planers is negligible.

The total power consumption in milliwatts to satisfy all of the above disk requests using the Shortest Seek Time First disk scheduling algorithm is ________.

Answer: (85)

42. Consider the following program written in pseudo-code. Assume that *x* and *y* are integers.

```
Count(x,y)    {
if (y != 1){
    if (x!= 1) {
    printf ("*");
```

```
        Count (x/2, y);
        }
        else {
        y = y-1;
        Count(1024,  y) ;
        }
        }
}
```

The number of times that the `print` statement is executed by the call `Count(1024, 1024)` is____.

Answer: (10230)

43. Consider the following problems. $L(G)$denotes the language generated by a grammar G. $L(M)$denotes the language accepted by a machine M.

(I) For an unrestricted grammar G and a string w whether $w \in L(G)$

(II) Given a Turing machine M, whether $L(M)$is regular

(III) Given two grammars $G_1$and G_2. whether $L(G_1)=L(G_2)$

(IV) Given an NFA N. whether there is a deterministic PDA P such that N and P accept the same language.

Which one of the following statements is correct?

(A) Only I and II are undecidable

(B) Only III is undecidable

(C) Only II and IV are undecidable

(D) Only I. II and III are undecidable

Answer: (D)

44. Consider an IP packet with a length of 4.500 bytes that includes a 20-byte IPv4 header anda 40-byte TCP header. The packet is forwarded to an lPv4 router that supports a MaximumTransmission Unit (MTU) of 600 bytes. Assume that the length of the IP header in all the outgoing frag1ments of this packet is 20 bytes. Assume that the fragmentation offset valuestored in the first fragment is 0.

The fragmentation offset value stored in the third fragment is ____________.

Answer: (144)

45. Consider the first-order logic sentence

$$\phi \equiv \exists s \exists t \exists u \forall v \forall w \forall x \forall y \ \psi(s,t,u,v,w,x,y)$$

Where $\psi(s,t,u,v,w,x,y)$ is a quantifier-free first-order logic formula using only predicate symbols and possibly equality, but no function symbols. Suppose φ has a model with a universe containing 7 elements.

Which one of the following statements is necessarily true?

(A) There exists at least one model of φ with universe of size less than or equal to 3.

(B) There exists no model of φ with universe of size less than or equal to 3.

(C) There exists no model of φ with universe of size greater than 7.

(D) Every model of φ has a universe of size equal to 7.

Answer: (A)

46. Let G be a simple undirected graph. Let T_D be a depth first search tree of G. Let $T_B$be a breadth first search tree of G. Consider the following statements.

(I) No edge of G is a cross edge with respect to T_D(A cross edge in G is between two nodes neither of which is an ancestor of the other in T_D.).

(II) For every edge (u, v) of G, if u is at depth $i$and v is at depth j in T_B, then $|i - j| = 1$.

Which of the statements above must necessarily be true?

(A) I only (C) Both I and II (B) II only (D) Neither I nor II

Answer: (A)

47. In a system. there are three types of resources: E, F and G. Four processes P_0. P_1, $P_2$and P_3execute concurrently. At the outset. the processes have declared their maximum resourcerequirements using a matrix named Max as given below. For example. Max(P1,Fl is the maximum nwnber of instances of F that P_2would require. The number of instances of theresources allocated to the various processes at any given state is given by a matrixnamedAllocation.

Consider a state of the system with the Allocation matrix as shown below, and in which 3instances of *E* and 3 instances of Fare the only resources available.

Allocation			
	E	F	G
P_0	1	0	1
P_1	1	1	2
P_2	1	0	3
P_3	2	0	0

Max			
	E	F	G
P_0	4	3	1
P_1	2	1	4
P_2	1	3	3
P_3	5	4	1

From the perspective of deadlock avoidance. which one of the following is true?

(A) The system is in *safe* state.

(B) The system is not in *safe* state. but would be *safe* if one more instance of *E* were available

(C) The system is not in *safe* state. but would be *safe* if one more instance of *F* were available

(D) The system is not in *safe* state. but would be *safe* if one more instance of *G* were available

Answer: (A)

48. Let *G* be a graph with 100! Vertices, with each vertex labelled by a distinct permutation ofthe numbers 1,2, ..., 100. There is an edge between vertices u and *v* if and only if the label of *u* can be obtained by swapping two adjacent numbers in the label of *v*. Let *y* denote the degree of a vertex in *G*. and *z* denote the number of connected components in *G*.

Then $y + 10z =$ __________.

Answer: (109)

49. Consider a simple communication system where multiple nodes arc connected by a sharedbroadcast medium (like Ethernet or wireless). The nodes in the system use the following carrier-sense based medium access protocol. A node that receives a packet to transmit will carrier-sense the medium for *5* units of time. If the node does not detect any other transmission in this duration it starts transmitting its packet in the next time unit. If the nodedetects another transmission it waits until this other transmission finishes, and then begins to carrier-sense for *5* time units again. Once they start to transmit nodes do not perform

any collision detection and continue transmission even if a collision occurs. All transmission last for20 units of time. Assume that the transmission signal travels at the speed of 10 meters per unit time in the medium.

Assume that the system has two nodes P and Q. located at a distance d meters from each other. P starts transmitting a packet at time $t=O$ after successfully completing its carrier-sense phase. Node Q has a packet to transmit at time $r=O$ and begins to carrier-sense the medium.

The maximum distance d (in meters. rounded to the closest integer) that allows Q to successfully avoid a collision between its proposed transmission and P's ongoing transmission is ___________.

Answer: (50)

50. Consider the following languages:

I. $\{a^m b^n c^p d^q \mid m+p = n+q, \text{ where } m, n, p, q \geq 0\}$

II. $\{a^m b^n c^p d^q \mid m = n \text{ and } p = q, \text{ where } m, n, p, q \geq 0\}$

III. $\{a^m b^n c^p d^q \mid m = n = p \text{ and } p \neq q, \text{ where } m, n, p, q \geq 0\}$

IV. $\{a^m b^n c^p d^q \mid mn = p + q, \text{ where } m, n, p, q \geq 0\}$

Which of the languages above are context-free?

(A) I and IV only

(B) I and II only

(C) II and III only

(D) II and IV only

Answer: (B)

51. Consider the following four relational schemas. For each schema all non-trivial functionaldependencies are listed. The underlined attributes are the respective primary keys.

Schema I: Registration (<u>rollno</u>, courses)
Field 'courses' is a set-valued attribute
containing the set of courses a student
hasregistered for:
Non-trivial functional dependency:
Rollno $\rightarrow$ courses

Schema II: Registration (<u>rollno, courseid,</u> email)
Non-trivial functional dependency:
rollno, courseid $\rightarrow$ email
email $\rightarrow$ rollno

Schema III: Registration (<u>rollno, courseid,</u> marks, grade)
Non-trivial functional dependencies:
rollno, courseid → marks, grade
marks → grade

Schema IV: Registration (<u>rollno, courseid,</u> credit)
Non-trivial functional dependencies:
rollno, courseid → credit
courseid → credit

Answer: (B)

52. Consider the following C program:

```
#include<stdio.h>
void fun1(char *s1, char *s2){
    char *tmp;
    tmp = s1;
    s1 = s2;
    s2 = tmp;
}
void fun2(char **s1, char **s2){
    char *tmp;
    tmp = *s1;

    *s1 = *s2;
    *s2 = tmp;
}
int main (){
    char *str1 = "Hi",   *str2 = "Bye";
    fun1(str1,  str2);      printf("%s %s ",  str1, str2);
    fun2(&str1,  &str2); printf("%s %s",  str1,  str2);
    return 0;
}
```

The output of the program above is

(A) `Hi Bye Bye Hi`

(B) `Hi Bye Hi Bye`

(C) `Bye Hi Hi Bye`

(D) `Bye Hi Bye Hi`

Answer: (A)

53. The number of possible min-heaps containing each value from {1,2,3,4, 5, 6, 7} exactly once is ________.

Answer: (80)

54. Consider the weights and values of items listed below. Note that there is only one unit of each item.

Item number	Weight (in Kgs)	Value (in Rupees)
1	10	60
2	7	28
3	4	20
4	2	24

The task is to pick a subset of these items such that their total weight is no more than 11 Kgs and their total value is maximized. Moreover, no item may be split. The total value of items picked by an optimal algorithm is denoted by V_{opt}. A greedy algorithm sorts the items by their value-to-weight ratios in descending order and packs them greedily, starting from the first item in the ordered list. The total value of items picked by the greedy algorithm is denoted V_{greedy}

The value of V_{opt}-V_{greedy} is____________.

Answer: (16)

55. Consider the unsigned 8-bit fixed point binary number representation below.

$b_7\ b_6\ b_5\ b_4\ b_3.b_2\ b_1\ b_0$

Where the position of the binary point is between b_3 and b_2. Assume b_7 is the most significant bit. Some of the decimal numbers listed below **cannot** be represented **exactly** in the above representation:

(i) 31.500

(ii) 0.875

(iii) 12.100

(iv) 3.001

Which one of the following statements is CORRECT?

(A) None of (i). (ii). (iii). (iv) can be exactly represented

(B) Only (ii) cannot be exactly represented

(C) Only (iii) and (iv) cannot be exactly represented

(D) Only (i) and (ii) cannot be exactly represented

Answer: (C)

Computer Science Engineering

Q. No. 1 – 25 Carry One Mark Each

1. Let X be a Gaussian random variable mean 0 and variance σ^2 .Let Y=max(X, 0) where max (a,b) is the maximum of a and b. The median of Y is ____________.

Answer: (0)

2. Consider the Karnaugh map given below, where x represents "don't care" and blank represents 0.

dc \ ba	00	01	11	10
00		x	x	
01	1			x
11	1			1
10		x	x	

Assume for all inputs (a,b, c, d) the respective complements $\left(\bar{a}, \bar{b}, \bar{c}, \bar{d}\right)$ are also available. The above logic is implemented 2-input NOR gates only. The minimum number of gates required is ____________.

Answer: (1)

3. The statement $(\neg p) \Rightarrow (\neg q)$ is logically equivalent to which of the statements below?

I. $p \Rightarrow q$

II. $q \Rightarrow p$

III. $(\neg q) \vee p$

IV. $(\neg p) \vee q$

(A) I only

(B) I and IV only

(C) II only

(D) II and III only

Answer: (D)

4. Consider the following table:

Algorithms		Design Paradigms	
P.	Kruskal	i.	Divide and Conquer
Q.	Quicksort	ii.	Greedy
R.	Floyd-Warshall	iii.	Dynamic Programming

Match the algorithms to the design paradigms they are based on.

(A) P-(ii), Q-(iii),R-(i)

(B) P-(iii), Q-(i), R-(ii)

(C) P-(ii), Q-(i), R-(iii)

(D) P-(i), Q-(ii), R-(iii)

Answer: (C)

5. A sender S sends a message m to receiver R, which is digitally signed by S with its private key. In this scenario, one or more of the following security violations can take place.

I. S can launch a birthday attack to replace m with a fraudulent message.

II. A third party attacker can launch a birthday attack to replace m with a fraudulent message.

III. R can launch a birthday attack to replace m with a fraudulent message.

Which of the following are possible security violations?

(A) I and II only

(B) I only

(C) II only

(D) II and III only

Answer: (B)

6. Consider the following grammar.

$P \rightarrow xQRS$

$Q \rightarrow yz|z$

$R \rightarrow w|\in$

$S \rightarrow y$

What is FOLLOW (Q) ?

(A) {R}

(B) {w}

(C) {w, y}

(D) {w, \$}

Answer: (C)

7. Consider the language L given by the regular expression $(a+b)^* b(a+b)$ over the alphabet {a,b}. The smallest number of states needed in a deterministic finite-state automation (DFA) accepting L is ___________ .

Answer: (4)

8. Consider a two-level cache hierarchy with L1 and L2 caches. An application incurs 1.4 memory accesses per instruction on average. For this application, the miss rate of L1 cache 0.1, the L2 cache experiences, on average, 7 misses per 1000 instructions. The miss rate of L2expressed correct to two decimal places is ___________.

Answer: (0.05)

9. Consider the following CPU processes with arrival times (in milliseconds) and length of CPU burst (in milliseconds) as given below:

Process	Arrival time	Burst time
P1	0	7
P2	3	3
P3	5	5
P4	6	2

If the pre-emptive shortest remaining time first scheduling algorithm is used to schedule the processes, then the average waiting time across all processes is ________ milliseconds.

Answer: (3)

10. Threads of a process share

(A) global variable but not heap.

(B) heap but not global variables.

(C) neither global variables nor heap.

(D) Both heap and global variables.

Answer: (D)

11. Let $c_1 \ldots\ldots c_n$ be scalars, not all zero, such that $\sum_{i=1}^{n} c_i a_i = 0$ where a_i are column vectors in R^n.

Consider the set of linear equations $Ax = b$

where $A = [a_1 \ldots\ldots a_n]$ and $b = \sum_{i=1}^{n} a_i$ .The set of equations has

(A) a unique solution at $x = J_n$ where J_n denotes a n-dimensional vector of all 1

(B) no solution

(C) infinitely many solutions

(D) finitely many solutions

Answer: (C)

12. Consider the C code fragment given below.

```
typedef struct node
{
int data;
node* next ;
} node;
void join (node* m, node* n)    {
node* p=n ;
while (p->next ! =NULL){
p = p ->next ;
}
p-> next = m;
}
```

Assuming that m and n point to valid NULL- terminated linked lists, invocation of join will

(A) append list m to the end of list n for all inputs.

(B) either cause a null pointer dereference or append list m to the end of list n.

(C) cause a null pointer dereference for all inputs.

(D) append list n to the end of list m for all inputs.

Answer: (B)

13. The n-bit fixed-point representation of an unsigned real number real X uses *f* bits for the fraction part. Let $i = n - f$. The range of decimal values for X in this representation is

(A) 2^{-f} to 2^{i}

(B) 2^{-f} to $\left(2^{i} - 2^{-f}\right)$

(C) 0 to 2^{i}

(D) 0 to $\left(2^{i} - 2^{-f}\right)$

Answer: (D)

14. Consider the following intermediate program in three address code

```
p=a-b
q=p*c
p=u*v
q=p+q
```

Which one of the following corresponds to *a static single assignment* form of the above code ?

(A)
$p_1 = a - b$
$q_1 = p_1 * c$
$p_1 = u * v$
$q_1 = p_1 + q_1$

(B)
$p_3 = a - b$
$q_4 = p_3 * c$
$p_4 = u * v$
$q_5 = p_4 + q_4$

(C)
$p_1 = a - b$
$q_1 = p_2 * c$
$p_3 = u * v$
$q_2 = p_4 + q_3$

(D)
$p_1 = a - b$
$q_1 = p * c$
$p_2 = u * v$
$q_2 = p + q$

Answer: (B)

15. Consider the C struct defined below:

```
struct data {
    int marks [100] ;
    char grade;
    int cnumber;
};
struct data student;
```

The base address of student is available in register R1. The field student.grade can be accessed efficiently using

(A) Post-increment addressing mode. (R1)+

(B) Pre-decrement addressing mode, -(R1)

(C) Register direct addressing mode, R1

(D) Index addressing mode, X(R1), where X is an offset represented in 2's complement 16-bit representation.

Answer: (D)

16. Consider a TCP client and a TCP server running on two different machines. After completing data transfer, the TCP client calls **close** to terminate the connectional and a FIN segment is sent to the TCP server. Server-side TCP responds by sending an ACK which is received by the client-side TCP. As per the TCP connections state diagram (RFC 793), in which state does the client-side TCP connection wait for the FIN from the sever-side TCP?

(A) LAST-ACK (B) TIME-WAIT (C) FIN-WAIT-1 (D) FIN-WAIT-2

Answer: (D)

17. Consider the following context-free grammar over the alphabet $\Sigma = \{a, b, c\}$ with S as the start symbol.

$$S \rightarrow abScT \mid abcT$$
$$T \rightarrow bT \mid b$$

Which one of the following represents the language generated by the above grammar ?

(A) $\left\{(ab)^n (cb)^n \mid n\ {}^{3}\ 1\right\}$

(B) $\left\{(ab)^n cb^{m_1} cb^{m_2} ... cb^{m_n} \mid n, m_1, m_2, ... m_n\ {}^{3}\ 1\right\}$

(C) $\left\{(ab)^n \left(cb^m\right)^n \mid m, n\ {}^{3}\ 1\right\}$

(D) $\left\{(ab)^n \left(cb^n\right)^m \mid m, n\ {}^{3}\ 1\right\}$

Answer: (B)

18. Consider the first-order logic sentence $F: \forall z\left(\exists y R(x, y)\right)$. Assuming non-empty logical domains, which of the sentences below are *implied* by F?

I. $\exists y\left(\exists x R(x, y)\right)$

II. $\exists y\left(\forall x R(x, y)\right)$

III. $\forall y\left(\exists x R(x, y)\right)$

IV. $\neg\exists x\left(\forall y \neg R(x, y)\right)$

(A) IV only (B) I and IV only

(C) II only (D) II and III only

Answer: (B)

19. When two 8-bit numbers $A_7....A_0$ and $B_7.....B_0$ in 2's complement representation (with A_0 and B_0 as the least significant bits) are added using a **ripple-carry adder**, the sum bits obtained are $S_7....S_0$ and the carry bits are $C_7....C_0$. An overflow is said to have occurred if

(A) the carry bit C_7 is 1

(B) all the carry bits $(C_7....C_0)$ are 1

(C) $(A_7 B_7.\overline{S_7} + \overline{A_7}.\overline{B_7}.S_7)$ is 1

(D) $(A_0 .B_0.\overline{S_0} + \overline{A_0}.\overline{B_0}.S_0)$ is 1

Answer: (C)

20. Consider a database that has the relation schema EMP (EmpId, EmpName, and DeptName). An instance of the schema EMP and a SQL query on it are given below:

EMP		
EmpId	**EmpName**	**DeptName**
1.	XYA	AA
2.	XYB	AA
3.	XYC	AA
4.	XYD	AA
5.	XYE	AB
6.	XYF	AB
7.	XYG	AB
8.	XYH	AC
9.	XYI	AC
10	XYJ	AC
11.	XYK	AD
12.	XYL	AD
13.	XYM	AE

```
SELECT AVG(EC.Num)
FROM EC
WHERE(DeptName, Num)IN
        (SELECT DeptName,COUNT(EmpId)AS
                    EC(DeptName, Num)
        FROM EMP
        GROUP BY DeptName)
```

The output of executing the SQL query is _____.

Answer: (2.6)

21. The following functional dependencies hold true for the relational schema R{V,W,X,Y,Z}:

$V \rightarrow W$
$VW \rightarrow X$
$Y \rightarrow VX$
$Y \rightarrow Z$

Which of the following is irreducible equivalent for this set of functional dependencies ?

(A) $V \rightarrow W$, $V \rightarrow X$, $Y \rightarrow V$, $Y \rightarrow Z$

(B) $V \rightarrow W$, $W \rightarrow X$, $Y \rightarrow V$, $Y \rightarrow Z$

(C) $V \rightarrow W$, $V \rightarrow X$, $Y \rightarrow V$, $Y \rightarrow X$, $Y \rightarrow Z$

(D) $V \rightarrow W$, $W \rightarrow X$, $Y \rightarrow V$, $Y \rightarrow X$, $Y \rightarrow Z$

Answer: (A)

22. Consider the following functions from positive integers to real numbers:

$$10, \sqrt{n}, n, \log_2 n, \frac{100}{n}$$

The CORRECT arrangement of the above functions in increasing order of asymptotic complexity is:

(A) $\log_2 n, \frac{100}{n}, 10, \sqrt{n}, n$

(B) $\frac{100}{n}, 10, \log_2 n, \sqrt{n}, n$

(C) $10, \frac{100}{n}, \sqrt{n}, \log_2 n, n$

(D) $\frac{100}{n}, \log_2 n, 10, \sqrt{n}, n$

Answer: (B)

23. Let T be a tree with 10 vertices. The sum of the degrees of all the vertices in T is _________.

Answer: (18)

24. Let T be a binary search tree with 15 nodes. The minimum and maximum possible heights of T are :

Note: *The height of a tree with a single node is 0.*

(A) 4 and 15 respectively

(B) 3 and 14 respectively

(C) 4 and 14 respectively

(D) 3 and 15 respectively

Answer: (B)

25. Consider the following C code:

```
# include <stdio.h>
int * assignval (int *x, int val)  {
    *x = val;
    return x;
}
void main ( ){
    int  * x= malloc (sizeof (int));
    if (NULL = = x) return;
    x = assignval (x,0);
    if(x)   {
    x=(int*) malloc (sizeof (int));
    if (NULL = = x) return;
    x = assignval (x, 10);
}
printf("%d\n", *x);
free (x);   }
```

The code suffers from which one of the following problems:

(A) compiler error as the return of malloc is not typecast appropriately.

(B) compiler error because the comparison should be made as x==NULL and not as shown.

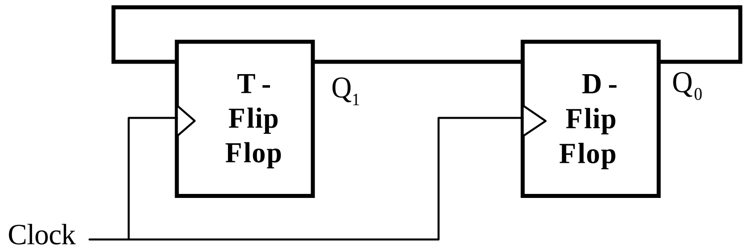
(C) compiles successfully but execution may result in dangling pointer.

(D) compiles successfully but execution may result in memory leak.

Answer: (D)

Q. No. 26 – 55 Carry Two Marks Each

26. Consider a combination of T and D flip-flops connected as shown below. The output of the D flip-flop is connected to the input of the T flip-flop and the output of the T Flip-flop is connected to the input of the D Flip-flop.



Initially, both Q_0 and Q_1 are set to 1 (before the 1st clock cycle). The outputs

(A) Q_1Q_0 after the 3rd cycle are 11 and after the 4th cycle are 00 respectively

(B) Q_1Q_0 after the 3rd cycle are 11 and after the 4th cycle are 01 respectively

(C) Q_1Q_0 after the 3rd cycle are 00 and after the 4th cycle are 11 respectively

(D) Q_1Q_0 after the 3rd cycle are 01 and after the 4th cycle are 01 respectively

Answer: (B)

27. The number of integers between 1 and 500 (both inclusive) that are divisible by 3 or 5 or 7 is ______________.

Answer: (271)

28. Consider a RISC machine where each instruction is exactly 4 bytes long. Conditional and unconditional branch instructions use PC- relative addressing mode with Offset specified in bytes to the target location of the branch instruction. Further the Offset is always with respect to the address of the next instruction in the program sequence. Consider the following instruction sequence.

Instruction No.	**Instruction**
i:	add R2, R3, R4
i +1:	sub R5, R6, R7
i + 2:	cmp R1, R9, R10
i + 3	beq R1, Offset

If the target of the branch instruction is i, then the decimal value of the Offset is __________.

Answer: **(–16)**

29. Consider the C functions foo and bar given below:

```
int foo (int val ) {
     int x = 0;
     while (val> 0)  {
     x = x + foo ( val --);
}
     return val ;
}
int bar (int val )  {
int x = 0;
while (val> 0) {
     x = x + bar (val – 1) ;
     }
return val ;
}
```

Invocations of foo (3) and bar (3) will result in:

(A) Return of 6 and 6 respectively.

(B) Infinite loop and abnormal termination respectively.

(C) Abnormal termination and infinite loop respectively.

(D) Both terminating abnormally

Answer: **(C)**

30. In a RSA cryptosystem a participant A uses two prime numbers p = 13 and q =17 to generate her public and private keys. If the public key of A is 35. Then the private key of A is __________.

Answer: **(11)**

31. Let A be an array of 31 numbers consisting of sequence of 0's followed by a sequence of 1's. The problem is to find the smallest index *i* that A[*i*] is 1 by probing the minimum numbers of locations in A. The *worst case* number of probes performed by an *optimal* algorithm is ______________.

Answer: (5)

32. If G is grammar with productions

$S \rightarrow SaS \mid aSb \mid bSa \mid SS \mid \hat{I}$

where S is the start variable, then which one of the following is not generated by G?

(A) abab (B) aaab (C) abbaa (D) babba

Answer: (D)

33. The value of $\lim_{x \to 1} \frac{x^7 - 2x^5 + 1}{x^3 - 3x^2 + 2}$

(A) is 0 (B) is –1 (C) is 1 (D) does not exist

Answer: (C)

34. Instructions execution in a processor is divided into 5 stages. Instruction Fetch (IF), Instruction Decode (ID), Operand Fetch (OF), Execute (EX), and Write Back (WB), These stages take **5,4,20, 10 and 3 nanoseconds (ns)** respectively. A pipelined implementation of the processor requires buffering between each pair of consecutive stages with a delay of 2ns. Two pipelined implementations of the processor are contemplated.

(i) a naïve pipeline implementation (NP) with 5 stages and

(ii) an efficient pipeline (EP) where the OF stage id divided into stages OF1 and OF2 with execution times of 12 ns and 8 ns respectively.

The speedup (correct to two decimals places) achieved by EP over NP in executing 20 independent instructions with no hazards is _________________.

Answer: (1.508)

35. Consider a database that has the relation schemas EMP(EmpId, EmpName, DepId). And DEPT(DeptName, DeptId). Note that the DeptId can be permitted to be NULL in the relation EMP. Consider the following queries on the database expressed in tuple relational calculus.

(I) $\{t \mid \exists u \in EMP(t[EmpName] = u[EmpName] \wedge \forall v \in DEPT(t[DeptId] \neq v[DeptId]))\}$

(II) $\{t \mid \exists u \in EMP(t[EmpName] = u[EmpName] \wedge \exists v \in DEPT(t[DeptId] \neq v[DeptId]))\}$

(III) $\{t \mid \exists u \in EMP(t[EmpName] = u[EmpName] \wedge \exists v \in DEPT(t[DeptId] \neq v[DeptId]))\}$

Which of the above queries are safe?

(A) (I) and (II) only (B) (I) and (III) only

(C) (II) and (III) only (D) (I), (II) and (III)

Answer: (D)

36. Recall that Belady's anomaly is that the pages-fault rate may increase as the number of allocated frames increases. Now consider the following statements:

S_1: *Random page replacement* algorithm (where a page chosen at random is replaced) suffers from Belady's anomaly

S_2: *LRU page replacement* algorithm suffers from Belady's anomaly

Which of the following is CORRECT ?

(A) S_1 is true, S_2 is true (B) S_1 is true, S_2 is false

(C) S_1 is false , S_2 is true (D) S_1 is false, S_2 is false

Answer: (B)

37. The output of executing the following C program is ________.

```
# include <stdio.h>
int total (int v) {
while (v)   {
        count + = v & 1;
        v>> = 1;
}
        return count;
}
void main ( ) {
static int x = 0;
inti = 5;
for (; i> 0; i--)  {
        x=x + total (i) ;
```

```
}
printf ("%d\n", x) ;
}
```

Answer: **(23)**

38. Consider the following C program.

```
#include <stdio.h>
#include<string.h>
void printlength (char *s, char *t) {
     unsigned int c = 0;
     int len = ((strlen(s) - strlen (t)) > c) ?strlen(s): strlen(t);
     printf ("%d\n", len);
}
void main (  ) {
     char *x = "abc";
     char *y ="defgh";
     printlength (x,y);
```

Recall that strlen is defined in string.h as returning a value of type size_t, which is an unsigned int. The output of the program is _____________.

Answer: **(3)**

39. Consider the following languages over the alphabet $\sum=\{a,b,c\}$

Let $L_1=\{a^n b^n c^m \mid m,n\geq 0\}$ and $L_2=\{a^m b^n c^n \mid m,n\geq 0\}$

Which of the following are context-free languages ?

I. $L_1 \cup L_2$

II. $L_1 \cap L_2$

(A) I only (B) II only (C) I and II (D) Neither I nor II

Answer: **(A)**

40. Consider a 2-way set associative cache with 256 blocks and uses LRU replacement, Initially the cache is empty. Conflict misses are those misses which occur due the contention of multiple blocks for the same cache set. Compulsory misses occur due to first time access to the block. The following sequence of accesses to memory blocks.

(0,128,256,128,0,128,256,128,1,129,257,129,1,129,257,129)

is repeated 10 times. The number of *conflict misses* experienced by the cache is ___________.

Answer: (76)

41. Let u and v be two vectors in $\mathbf{R}^2$ whose Euclidean norms satisfy $\|u\| = 2\|v\|$. What is the value of α such that $w = u + \alpha v$ bisects the angle between u and v ?

(A) 2 (B) 1/2 (C) 1 (D) -1/2

Answer: (A)

42. Consider the following grammar:

```
stmt → ifexpr then else expr;stmt|0
expr → termrelopterm|term
term → id|number
if → a|b|c
number → [0-9]
```

Where **relop** is a relational operate (e.g<,>,….) ---O refers to the empty statement, and **if** , **then, else** are terminals.

Consider a program P following the above grammar containing ten **if** terminals. The number of control flows paths in P is _____________. For example the program

if e_1 **then** e_2 **else** e_3

has 2 controls flow paths $e_1 \rightarrow e_2$ and $e_1 \rightarrow e_3$

Answer: (1024)

43. In a database system, unique time stamps are assigned to each transaction using Lamport's logical clock . Let $TS(T_1)$ and $TS(T_2)$ be the timestamps of transactions T_1 and T_2 respectively. Besides, T_1 holds a lock on the resource R, and T_2 has requested a conflicting lock on the same resource R. The following

algorithm is used to prevent deadlocks in the database system assuming that a killed transaction is restarted with the same timestamp.

```
if TS(T2) < TS(T1) then
   T1 is killed
else T2 waits.
```

Assume any transactions that is not killed terminates eventually. Which of the following is TRUE about the database system that uses the above algorithm to prevent deadlocks?

(A) The database system is both deadlock-free and starvation- free.

(B) The database system is deadlock- free, but not starvation-free.

(C) The database system is starvation-free but not deadlock- free.

(D) The database system is neither deadlock- free nor starvation-free.

Answer: (A)

44. Let A and B be infinite alphabets and let # be a symbol outside both A and B. Let *f* be a total functional from A^* to B^*. We say *f* is *computable* if there exists a Turning machine M which given an input x in A^*, always halts with *f(x)* on its tape. Let L_f denote the language $\{x\#f(x) | x \in A^*\}$ .Which of the following statements is true:

(A) *f* if computable if and only if L_f is recursive.

(B) *f* is computable if and only L_f recursively enumerable.

(C) If *f* is computable then L_f is recursive, but not conversely.

(D) If *f* is computable then L_f is recursively enumerable, but not conversely.

Answer: (A)

45. Consider the expression $(a-1)^*(((b+c)/3)+d))$. Let X be the minimum number of registers required by an optimal code generation (without any register spill) algorithm for a load/store architecture in which

(i) only loads and store instructions can have memory operands and

(ii) arithmetic instructions can have only register or immediate operands.

The value of X is _________.

Answer: (2)

46. Let G = (V, E) be any connected undirected edge-weighted graph. The weights of the edges in E are positive and distinct. Consider the following statements:

I. Minimum spanning tree of G is always unique.

II. Shortest path between any two vertices of G is always unique.

Which of the above statements is/are necessarily true?

(A) I only (B) II only

(C) Both I and II (D) Neither I nor II

Answer: (A)

47. A multithreaded program P executes with x number of threads and uses y number of locks for ensuring mutual exclusion while operating on shared memory locations. All locks in the program are *non-reentrant*, i.e., if a thread holds a lock *l*, then it cannot re-acquire lock *l* without releasing it. If a thread is unable to acquire a lock, it blocks until the lock becomes available. The *minimum* value of x and the *minimum* value of y together for which execution of P can result in a deadlock are:

(A) x = 1, y = 2 (B) x =2, y=1 (C) x = 2,y=2 (D) x = 1, y = 1

Answer: (D)

48. The values of parameters for the Stop-and – Wait ARQ protocol are as given below:

Bit rate of the transmission channel = 1Mbps

Propagation delay from sender to receiver = 0.75 ms

Time to process a frame = 0.25ms

Number of bytes in the information frame =1980

Number of bytes in the acknowledge frame = 20

Number of overhead bytes in the information frame = 20

Assume that there are no transmission errors. Then the transmission efficiency (expressed in percentage) of the Stop-and – Wait ARQ protocol for the above parameters is _________(correct to 2 decimal places)

Answer: (89.33)

49. A computer network uses polynomials over *GF(2)* for error checking with 8 bits as information bits and uses $x^3 + x + 1$ as the generator polynomial to generate the check bits. In this network, the message 01011011 is transmitted as

(A) 01011011010 (B) 01011011011

(C) 01011011101 (D) 01011011100

Answer: (C)

50. Let p, q, and r be propositions and the expression $(p \to q) \to r$ be a contradiction. Then, the expression $(r \to p) \to q$ is

(A) a tautology

(B) a contradiction

(C) always TRUE when p is FALSE

(D) always TRUE when q is TRUE

Answer: (D)

51. A cache memory unit with capacity of N words and block size of B words is to be designed. If it is designed as a direct mapped cache, the length of the TAG field is 10 bits. If the cache unit is now designed as a 16-way set-associative cache, the length of the TAG field is ______bits.

Answer: (14)

52. Consider the following two functions.

```
void fun1 (int  n)
{
    if (n = =0 ) return;
    printf ("%d" , n);
    fun2 (n - 2);
    printf ("%d" , n);
}
```

```
void fun2 (int  n)
{
    if (n = = 0) return ;
    printf ("%d" , n);
    fun1(++n) ;
    printf ("%d" , n);
}
```

The output printed when fun1 (5) is called is

(A) 53423122233445 (B) 53423120112233

(C) 53423122132435 (D) 53423120213243

Answer: (A)

53. Consider a database that has the relation schema CR (StudentName, CourseName). An instance of the schema CR is as given below.

CR	
Student Name	**Course Name**
SA	CA
SA	CB
SA	CC
SB	CB
SB	CC
SC	CA
SC	CB
SC	CC
SD	CA
SD	CB
SD	CC
SD	CD
SE	CD
SE	CA
SE	CB
SF	CA
SF	CB
SF	CC

The following query is made on the database.

$$T1 \leftarrow \pi_{\text{CourseName}}\left(\sigma_{\text{StudentName='SA'}}\left(\text{CR}\right)\right)$$
$$T2 \leftarrow \text{CR} \div T1$$

The number of rows in T2 is ____________.

Answer: (4)

54. Let A be $n \times n$ real valued square symmetric matrix of rank 2 with $\sum_{i=1}^{n}\sum_{j=1}^{n} A_{ij}^{2} = 50.$ Consider the following statements.

(I) One eigen value must be in [-5, 5]

(II) The eigen value with the largest magnitude must be strictly greater than 5.

Which of the above statements about eigen values of A is/are necessarily CORRECT?

(A) Both (I) and (II)

(B) (I) only

(C) (II) only

(D) Neither (I) nor (II)

Answer: (B)

55. Consider the context-free grammars over the alphabet {a,b,c} given below. S and T are non-terminals

$$G_1 : S \to aSb \mid T, T \to cT \mid \epsilon$$
$$G_2 : S \to bSa \mid T, T \to cT \mid \epsilon$$

The language $L(G_1) \cap L(G_2)$ is

(A) Finite.

(B) Not finite but regular.

(C) Context-free but not regular.

(D) Recursive but not context-free.

Answer: (B)

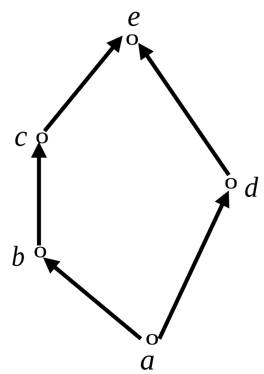
COMPUTER SCIENCE ENGINEERING

Q. No. 1 – 25 Carry One Mark Each

1. Consider the set $X=\{a,b,c,d,e\}$ under the partial ordering

$R=\{(a,a),(a,b),(a,c),(a,d),(a,e),(b,b),(b,c),(b,e),(c,c),(c,e),(d,d),(d,e),(e,e)\}$.

The Hasse diagram of the partial order (X, R) is shown below.



The minimum number of ordered pairs that need to be added to R to make (X, R) a lattice is ________.

Answer: (0)

2. Which of the following statements about parser is/are CORRECT?

I. Canonical LR is more powerful than SLR.

II. SLR is more powerful than LALR

III. SLR is more powerful than Canonical LR.

(A) I only (B) II only (C) III only (D) II and III only

Answer: (A)

3. Match the following:

P.	static char var;	**i.**	Sequence of memory locations to store addresses
Q.	m= malloc (10); m = NULL;	**ii.**	A variable located in data section of memory
R.	char * ptr [10]	**iii.**	Request to allocate a CPU register to store data
S.	register int var1;	**iv.**	A lost memory which cannot be freed

(A) P-(ii), Q-(iv), R-(i), S-(iii) (B) P-(ii), Q-(i), R-(iv), S-(iii)

(C) P-(ii), Q-(iv), R-(iii), S-(i) (D) P-(iii), Q-(iv), R-(i), S-(ii)

Answer: (A)

4. Let L_1, L_2 be any two context free languages and R be any regular language. Then which of the following is/are CORRECT ?

I. $L_1 \cup L_2$ is context – free **II.** $\overline{L_1}$ is context – free

III. $L_1 - R$ is context – free **IV.** $L_1 \cap L_2$ is context – free

(A) I, II and IV only (B) I and III only

(C) II and IV only (D) I only

Answer: (B)

5. G is undirected graph with *n* vertices and 25 edges such that each vertex of G has degree at least 3. Then the maximum possible value of *n* is ___________.

Answer: (16)

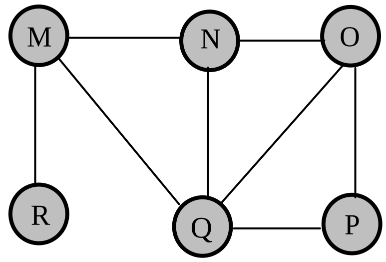
6. Let p, q, r denote the statements *"It is raining ," It is cold", and " It is pleasant,"* respectively. Then the statement *"It is not raining and it is pleasant, and it is not pleasant only if it is raining and it is cold"* is represented by

(A) $(\neg p \wedge r) \wedge (\neg r \rightarrow (p \wedge q))$ (B) $(\neg p \wedge r) \wedge ((p \wedge q) \rightarrow \neg r)$

(C) $(\neg p \wedge r) \vee ((p \wedge q) \rightarrow \neg r)$ (D) $(\neg p \wedge r) \vee (r \rightarrow (p \wedge q))$

Answer: (A)

7. The Breadth First Search (BFS) algorithm has been implemented using the queue data structure. Which one of the following is a possible order of visiting the nodes in the graph below?



(A) MNOPQR (B) NQMPOR (C) QMNROP (D) POQNMR

Answer: (D)

8. Let $P=\begin{bmatrix}1 & 1 & -1\\ 2 & -3 & 4\\ 3 & -2 & 3\end{bmatrix}$ and $Q=\begin{bmatrix}-1 & -2 & -1\\ 6 & 12 & 6\\ 5 & 10 & 5\end{bmatrix}$ be two matrices.

Then the rank of P +Q is _____________.

Answer: (2)

9. Consider socket API on a Linux machine that supports connected UDP sockets. A connected UDP socket is a UDP socket on which **connect** function has already been called. Which of the following statements is/are CORRECT ?

I. A connected UDP socket can be used to communicate with multiple peers simultaneously.

II. A process can successfully call **connect** function again for an already connected UDP socket.

(A) I only (B) II only (C) Both I and II (D) Neither I nor IIs

Answer: (B)

10. The minimum possible number of states of a deterministic automaton that accepts the regular language

$L=\{w_1aw_2 \mid w_1, w_2 \in \{a,b\}^*, |w_1|=2, |w_2|\geq 3\}$ is ____________.

Answer: (8)

11. Consider the following tables T1 and T2.

P	**Q**
2	2
3	8
7	3
5	8
6	9
8	5
9	8

R	**S**
2	2
8	3
3	2
9	7
5	7
7	2

In table T1, **P** is the primary key and **Q** is the foreign key referencing **R** in table T2 with on-delete cascade and on-update cascade. In table T2, **R** is the primary key and **S** is the foreign key referencing **P** in table T1 on-delete set NULL and on-update cascade. In order to delete record $\langle 3,8 \rangle$ from table T1, the number of additional records that need to be deleted from table T1 is ______________.

Answer: (0)

12. Which of the following is/are shared by all the threads in a process ?

I. Program counter

II. Stack

III. Address space

IV. Registers

(A) I and II only (B) III only (C) IV only (D) III and IV only

Answer: (B)

13. A circular queue has been implemented using a single linked list where each node consists of a value and a single pointer pointing to the next node. We maintain exactly two external pointers **FRONT** and **REAR** pointing to the front node and the rear node of the queue, respectively. Which of the following statements is/are **CORRECT** for such a circular queue, so that insertion and deletion operation can be performed in O (1) time ?

I. Next pointer of front node points to the rear node.

II. Next pointer of rear node points to the front node.

(A) I only (B) II only (C) Both I and II (D) Neither I nor II

Answer: (B)

14. Given the following binary number in 32-bit (single precision) IEEE-754 format:

00111110011011010000000000000000

The decimal value closest to this floating- point number is

(A) 1.45×10^{1} (B) 1.45×10^{-1} (C) 2.27×10^{-1} (D) 2.27×10^{1}

Answer: (C)

15. An ER model of a database consists of entity types A and B. These are connected by a relationship R which does not have its own attribute. Under which one of the following conditions, can the relational table for R be merged with that of A?

(A) Relationship R is one-to-many and the participation of A in R is total

(B) Relationship R is one-to-many and the participation of A in R is partial

(C) Relationship R is many-to one and the participation of A in R is total

(D) Relationship R is many-to one and the participation of A in R is partial

Answer: (C)

16. Match the algorithms with their time complexities:

Algorithm		**Time complexity**	
P.	Towers of Hanoi with n disks	i.	$\theta(n^2)$
Q.	Binary search given n sorted numbers	ii.	$\theta(n \log n)$
R.	Heap sort given n numbers at the worst case	iii.	$\theta(2^n)$
S.	Addition of two $n \times n$ matrices	iv.	$\theta(\log n)$

(A) P-(iii),Q-(iv), R-(i), S-(ii) (B) P-(iv),Q-(iii), R-(i), S-(ii)

(C) P-(iii),Q-(iv), R-(ii), S-(i) (D) P-(iv),Q-(iii), R-(ii), S-(i)

Answer: (C)

17. Match the following according to input (from the left column) to the complier phase (in the right column) that processes it.

Column-1		Column-2	
P.	Syntax tree	i.	Code generator
Q.	Character stream	ii.	Syntax analyzer
R.	Intermediate representation	iii.	Semantic analyzer
S.	Token stream	iv.	Lexical analyzer

(A) P-(ii), Q-(iii), R-(iv), S-(i)
(B) P-(ii), Q-(i), R-(iii), S-(iv)
(C) P-(iii), Q-(iv), R-(i), S-(ii)
(D) P-(i), Q-(iv), R-(ii), S-(iii)

Answer: (C)

18. Consider the following statements about the routing protocols, Routing Information Protocol (RIP) and Open Shortest Path First (OSPF) in an IPv4 network.

I. RIP uses distance vector routing

II. RIP packets are sent using UDP

III. OSPF packets are sent using TCP

IV. OSPF operation is based on link-state routing

Which of the statements above are CORRECT?

(A) I and IV only
(B) I, II and III only
(C) I, II and IV only
(D) II, III and IV only

Answer: (C)

19. If $f(x) = R\sin\left(\frac{\pi x}{2}\right) + S, f'\left(\frac{1}{2}\right) = \sqrt{2}$ and $\int_0^1 f(x)dx = \frac{2R}{\pi}$, then the constants R and S are, respectively

(A) $\frac{2}{\pi}$ and $\frac{16}{\pi}$
(B) $\frac{2}{\pi}$ and 0
(C) $\frac{4}{\pi}$ and 0
(D) $\frac{4}{\pi}$ and $\frac{16}{\pi}$

Answer: (C)

20. In a file allocation system, which of the following allocation schemes(s) can be used if no external fragmentation is allowed?

I. Contiguous **II.** Linked **III.** Indexed

(A) I and III only (B) II only (C) III only (D) II and III only

Answer: (D)

21. Consider a quadratic equation $x^2 - 13x + 36 = 0$ with coefficients in a base b. The solutions of this equation in the same base b are x = 5 and x = 6. Then b = ___________.

Answer: (8)

22. Identify the language generated by the following grammar, where S is start variable.

$S \to XY$

$X \to aX | a$

$Y \to a\,Yb | \in$

(A) $\{a^m b^n | m \geq n, n > 0\}$

(B) $\{a^m b^n | m \geq n, n \geq 0\}$

(C) $\{a^m b^n | m > n, n \geq 0\}$

(D) $\{a^m b^n | m > n, n > 0\}$

Answer: (C)

23. The representation of the value of a 16-bit unsigned integer X in hexadecimal number system is BCA9. The representation of the value of X in octal number system is

(A) 571244 (B) 736251 (C) 571247 (D) 136251

Answer: (D)

24. Consider the following function implemented in C:

```
void print xy (int x, int y) {
int *ptr ;
x = 0;
ptr = &x;
```

```
y = * ptr;
* ptr = l;
printf ("%d, %d," x,y);
}
```

The output of invoking print xy (l, l) is

(A) 0,0 (B) 0,1 (C) 1,0 (D) 1,1

Answer: (C)

25. The maximum number of IPv4 router addresses that can be listed in the record route (RR) option field of an IPv4 header is __________.

Answer: (9)

Q. No. 26 – 55 Carry Two Marks Each

26. Consider a binary code that consists of only four valid code words as given below:

00000,01011,10101,11110

Let the minimum Hamming distance of the code be p and the maximum number of erroneous bits that can be corrected by the code be q. Then the values of p and q are

(A) p = 3 and q = 1 (B) p = 3 and q = 2

(C) p = 4 and q = 1 (D) p = 4 and q = 2

Answer: (A)

27. A system shares 9 tape drives. The current allocation and maximum requirement of tape drives for three processes are shown below:

Process	Current Allocation	Maximum Requirement
P1	3	7
P2	1	6
P3	3	5

Which of the following best describes current state of the system ?

(A) Safe, Deadlocked (B) Safe, Not Deadlocked

(C) Not Safe, Deadlocked (D) Not Safe, Not deadlocked

Answer: (B)

28. Two transactions T_1 and T_2 are given as:

$$T_1 : r_1(X)w_1(X)r_1(Y)w_1(Y)$$
$$T_2 : r_2(Y)w_2(Y)r_2(Z)w_2(Z)$$

where $r_i(V)$ denotes a read operation by transaction T_i on a variable V and $w_i(V)$ denotes a *write* operations by transaction T_i on a variable V. The total number of conflict serializable schedules that can be formed by T_1 and T_2 is ______________.

Answer: (54)

29. If w, x, y, z are Boolean variables, then which one of the following is INCORRECT ?

(A) $wx + w(x+y) + x(x+y) = x + wy$

(B) $\overline{w\bar{x}\left(y+\bar{z}\right)} + \overline{w}x = \overline{w} + x + \bar{y}z$

(C) $(w\bar{x}(y + x\bar{z}) + \overline{w}\overline{x})y = x\bar{y}$

(D) $(w+y)(wxy+wyz) = wxy + wyz$

Answer: (C)

30. Consider the following C Program.

```
# include <stdio.h>
#include<string.h>
#int main ( ){
    char*  c = "GATECSIT2017";
    char*  p = c;
printf("%d", (int) strlen (c+2[p]-6[p]-1));
return 0;
}
```

The output of the program is ______________.

Answer: (2)

31. P and Q are considering to apply for a job. The probability that P applies for the job is $\frac{1}{4}$. The probability that P applies for the job given that Q applies for the job is $\frac{1}{2}$, and the probability that Q applies for the job given that P applies for the job $\frac{1}{3}$. Then the probability that P does not apply for the job given that Q does not apply for the job is

(A) $\frac{4}{5}$ (B) $\frac{5}{6}$ (C) $\frac{7}{8}$ (D) $\frac{11}{12}$

Answer: (A)

32. If the characteristics polynomial of 3×3 matrix M over R (the set of real numbers) is $\lambda^3-4\lambda^2+a\lambda+30, a\in R,$ and one eigen value of M is 2, then the largest among the absolute values of the eigen values of M is ________.

Answer: (5)

33. Consider the following expression grammar G:

$E\rightarrow E-T\,|\,T$
$T\rightarrow T+F\,|\,F$
$F\rightarrow (E)\,|\,id$

Which of the following grammars is not left recursive, but is equivalent to G?

(A)
$E\rightarrow E-T\,|\,T$
$T\rightarrow T+F\,|\,F$
$F\rightarrow (E)\,|\,id$

(B)
$E\rightarrow TE'$
$E'\rightarrow -TE'\,|\in$
$T\rightarrow T+F\,|\,F$
$F\rightarrow (E)\,|\,id$

(C)
$E\rightarrow TX$
$X\rightarrow -TX\,|\in$
$T\rightarrow FY$
$Y\rightarrow +FY\,|\in$
$F\rightarrow (E)\,|\,id$

(D)
$E\rightarrow TX\,|\,(TX)$
$X\rightarrow -TX\,|+TX\,|\in$
$T\rightarrow id$

Answer: (C)

34. In a two-level cache system, the access times of L_1 and L_2 caches are 1 and 8 clock cycles, respectively. The miss penalty from L_2 cache to main memory is 18 clock cycles . The miss rate of L_1 cache is twice that of L_2. The average memory access time (AMAT) of this cache system is 2 cycles. This miss rates of L_1 and L_2 respectively are :

(A) 0.111 and 0.056 (B) 0.056 and 0.111

(C) 0.0892 and 0.1784 (D) 0.1784 and 0.0892

Answer: (A)

35. Consider two hosts X and Y, connected by a single direct link of rate 10^6 bits/sec . The distance between the two hosts is 10,000km and the propagation speed along the link is 2×10^8 m/sec . Host X sends a file of 50,000 bytes as one large message to host Y continuously. Let the transmission and propagation delays be *p* milliseconds and *q* milliseconds, respectively . Then the values of *p* and *q* are

(A) p = 50 and q = 100 (B) p = 50 and q = 400

(C) p = 100 and q = 50 (D) p = 400 and q = 50

Answer: (D)

36. Consider the recurrence function

$$T(n) = \begin{cases} 2T(\sqrt{n}) + 1, & n > 2 \\ 2, & 0 < n \le 2 \end{cases}$$

Then T(n) in terms of θ notation is

(A) $\theta(\log\log n)$ (B) $\theta(\log n)$ (C) $\theta(\sqrt{n})$ (D) $\theta(n)$

Answer: (B)

37. If a random variable X has a Poisson distribution with mean 5, then the expectation

$E\left[(X+2)^2\right]$ equals _______________.

Answer: (54)

38. Consider the following C function

```
int fun (int n) {
     int i, j;
      for (i = 1; i< = n; i++)     {
                for (j = 1 ; j < n ; j+=i)     {
    printf ("%d %d ,i, j ) ;
                 }
    }     }
```

Time complexity of fun in terms of θ notation is

(A) $\theta\left(n\sqrt{n}\right)$ (B) $\theta\left(n^2\right)$ (C) $\theta\left(n\log n\right)$ (D) $\theta\left(n^2\log n\right)$

Answer: (C)

39. The pre-order transversal of a binary search tree is given by 12, 8, 6, 2, 7, 9, 10, 16, 15, 19, 17, 20. Then the post-order traversal of this tree is:

(A) 2,6,7,8,9,10,12,15,16,17,19,20

(B) 2,7,6,10,9,8,15,17,20,19,16,12

(C) 7,2,6,8,9,10,20,17,19,15,16,12

(D) 7,6,2,10,9,8,15,16,17,20,19,12

Answer: (B)

40. Consider the C program fragment below which is meant to divide x by y using repeated subtractions. The variables x, y, q and r are all unsigned int.

```
while (r >= y)    {
r = r - y;
q = q +1;
}
```

Which of the following conditions on the variables x, y, q and r before the execution of the fragment will ensure that the loop terminates in a state satisfying the condition x = = (y*q+r)?

(A) (q = = r) && (r = =0)

(B) (x > 0) && (r = =x) && (y > 0)

(C) (q = = 0) && (r = = x) && (y > 0)

(D) (q = = 0) && (y > 0)

Answer: (C)

41. A message is made up entirely of characters from the set X= {P,Q,R,S,T}. The table of probabilities for each of the characters is shown below:

Character	Probability
P	0.22
Q	0.34
R	0.17
S	0.19
T	0.08
Total	1.00

If a message of 100 characters over X is encoded using Huffman coding, then the expected length of the encoded message in bits is_____

Answer: (225)

42. The next state table of a 2-bit saturating up-counter is given below.

Q_1	Q_0	Q_1^+	Q_0^+
0	0	0	1
0	1	1	0
1	0	1	1
1	1	1	1

The counter is built as a synchronous sequential circuit using T flip-flops. The expression for T_1 and T_0 are

(A) $T_1 = Q_1Q_0$, $T_0 = \overline{Q}_1\overline{Q}_0$

(B) $T_1 = \overline{Q}_1Q_0$, $T_0 = \overline{Q}_1 + \overline{Q}_0$

(C) $T_1 = Q_1 + Q_0$, $T_0 = \overline{Q}_1 + \overline{Q}_0$

(D) $T_1 = Q_1Q_0$, $T_0 = \overline{Q}_1 + \overline{Q}_0$

Answer: (B)

43. Consider the set of processes with arrival time (in milliseconds). CPU burst time (in milliseconds), and priority (0 is the highest priority) shown below. None of the processes have I/O burst time.

Process	Arrival Time	Burst Time	Priority
P_1	0	11	2
P_2	5	28	0
P_3	12	2	3
P_4	2	10	1
P_5	9	16	4

The average waiting time (in milliseconds) of all the processes using preemptive priority scheduling algorithm is __________

Answer: (29)

44. For any discrete random variable X, with probability mass function

$P(X=j)=p_j, p_j \geq 0, j \in \{0,.....N\}$ and $\sum_{j=0}^{N} p_j = 1$, define the polynomial function

$g_x(z)=\sum_{j=0}^{N} p_j z^j$ For a certain discrete random variable Y, there exists a scalar $\beta \in [0,1]$ such that

$g_Y(z)=(1-\beta+\beta z)^N$. The expectation of Y is

(A) $N\beta(1-\beta)$

(B) $N\beta$

(C) $N(1-\beta)$

(D) Not expressible in terms of N and β alone

Answer: (B)

45. The read access times and the hit ratios for different caches in a memory hierarchy are as given below.

Cache	Read access time (in nanoseconds)	Hit ratio
I-cache	2	0.8
D-cache	2	0.9
L2-cache	8	0.9

The read access time of main memory is 90 nanoseconds. Assume that the caches use the referred word-first read policy and the write back policy. Assume that all the caches are direct mapped caches. Assume that the dirty bit is always 0 for all the blocks in the caches. In execution of a program, 60% of memory reads are for instruction fetch and 40% are for memory operand fetch. The average read access time in nanoseconds (up to 2 decimal places) is__________.

Answer: (4.72)

46. If the ordinary generating function of a sequence $\{a_n\}_{n=0}^{\infty}$ is $\dfrac{1+z}{(1-z)^3}$, then $a_3 - a_0$ is equal to ______.

Answer: (15)

47. Consider the following snippet of a C program. Assume that swap (&x, &y) exchanges the contents of x and y.

```
int main ( )    {
int array[]={3,5,1,4,6,2};
```

```
int done =0 ;
inti ;
while (done = = 0)   {
     done = 1;
     for (i = 0; i<=4; i ++)    {
     if (array [i] < array [i +1])    {
     swap (& array [i], &array [i+1]);
          done = 0;
     }
}
for (i = 5 ;i> =1; i --)    {
if (array [i] >array [ i-1])    {
swap ( & array [i] , &array [i-1]);
done = 0;
}
     }
}
printf( " %d " , array [3] );
}
```

The output of the program is ____________.

Answer: **(3)**

48. Consider the following C program.

```
# include <stdio.h>
int main ( ){
     int m = 10;
     int n, n1;
     n = ++m;
     n1 = m++;
n--;
     --n1;
     n -=n1;
printf ("%d", n) ;
     return 0;
```

}

The output of the program is ______________.

Answer: **(0)**

49. Consider the following database table named *top _scorer*.

top _scorer.

Player	Country	Goals
Klose	Germany	16
Ronald	Brazil	15
G Muller	Germany	14
Fontaine	France	13
Pele	Brazil	12
Klinsmann	Germany	11
Kocsis	Hungary	11
Batistuta	Argentina	10
Cubillas	Peru	10
Lato	Poland	10
Lineker	England	10
T Miller	Germany	10
Rahn	Germany	10

Consider the following SQL query:

```
SELECTta.playerFROM top _scorer AS ta
WHERE ta.goals> ALL (SELECT tb. goals
```

```
                                        FROM top _ scorer AS tb
                                        WHERE tb.country = 'Spain')
AND ta.goals> ANY ( SELECT tc. goals
                         FROM top_ scorer AS tc
                         WHERE tc.country = 'Germany')
```

The number of tuples returned by the above SQL query is ____________.

Answer: (7)

50. Given f (w,x,y,z) $=\sum_m$ (0,1,2,3,7,8,10) $+\sum_d$ (5,6,11,15), where *d* represents the don't care condition in Karnaugh maps. Which of the following is a minimum product-of-sums (POS) form of f(w,x,y,z) ?

(A) $f=(\overline{w}+\overline{z})(\overline{x}+z)$

(B) $f=(\overline{w}+z)(x+z)$

(C) $f=(w+z)(\overline{x}+z)$

(D) $f=(w+\overline{z})(\overline{x}+z)$

Answer: (A)

51. In a B^+ tree, if the search –key value is 8 bytes long, the block size is 512bytes and the block pointer size is 2 bytes, then maximum order of the B^+ tree is ________________.

Answer: (52)

52. Let L(R) be the language represented by regular expression R. Let L(G) be the language generated by a context free grammar G. Let L (M) be the language accepted by a Turning machine M. Which of the following decision problems are undecidable ?

I. Given a regular expression R and a string w, is $w \in L(R)$?

II. Given a context-free grammar G, $L(G)=\varnothing$?

III. Given a context-free grammar G, is $L(G)=\Sigma^*$ for some alphabet Σ ?

IV. Given a Turning machine M and a string w, is $w \in L(M)$?

(A) I and IV only (B) II and III only (C) II, III and IV only (D) III and IV only

Answer: (D)

53. Consider a machine with a byte addressable main memory of 2^{32} bytes divided into blocks of size 32 bytes. Assume that a direct mapped cache having 512 cache lines is used with this machine. The size of the tag field in bits is _______.

Answer: (18)

54. Let δ denote that transition function and $\hat{\delta}$ denote the extended transition function of the $\in -$NFA whose transition table is given below:

δ	$\in$	a	b
$\rightarrow q_0$	$\{q_2\}$	$\{q_1\}$	$\{q_0\}$
q_1	$\{q_2\}$	$\{q_2\}$	$\{q_3\}$
q_2	$\{q_0\}$	$\varnothing$	$\varnothing$
q_3	$\varnothing$	$\varnothing$	$\{q_2\}$

Then $\hat{\delta}(q_2, aba)$ is

(A) $\varnothing$ (B) $\{q_0, q_1, q_3\}$ (C) $\{q_0, q_1, q_2\}$ (D) $\{q_0, q_2, q_3\}$

Answer: (C)

55. Consider the following languages.

$L_1 = \{a^p \mid p \text{ is a prime number}\}$

$L_2 = \{a^n b^m c^{2m} \mid n \geq 0, m \geq 0\}$

$L_3 = \{a^n b^n c^{2n} \geq 0\}$

$L_4 = \{a^n b^n \mid n \geq 1\}$

Which of the following are CORRECT ?

I. L_1 is context-free but not regular.

II. L_2 is not context-free.

III. L_3 is not context-free but recursive.

IV. L_4 is deterministic context-free.

(A) I ,II and IV only (B) II and III only (C) I and IV only (D) III and IV only

Answer: (D)

GENERAL APTITUDE

Q. No. 1 – 5 Carry One Mark Each

1. Out of the following four sentences, select the most suitable sentence with respect to grammar and usage.

(A) I will not leave the place until the minister does not meet me.

(B) I will not leave the place until the minister doesn't meet me.

(C) I will not leave the place until the minister meet me.

(D) I will not leave the place until the minister meets me.

Answer: (D)

2. A rewording of something written or spoken is a ___________.

(A) paraphrase (B) paradox (C) paradigm (D) paraffin

Answer: (A)

3. Archimseedes said, "Give me a lever long enough and a fulcrum on which to place it, and I will move the world."

The sentence above is an example of a ________ statement.

(A) figurative (B) collateral (C) literal (D) figurine

Answer: (A)

4. If 'relftaga' means carefree, 'otaga' means careful and 'fertaga' means careless, which of the following could mean 'aftercare'?

(A) zentaga (B) tagafer (C) tagazen (D) relffer

Answer: (C)

5. A cube is built using 64 cubic blocks of side one unit. After it is built, one cubic block is removed from every corner of the cube. The resulting surface area of the body (in square units) after the removal is.

(A) 56 (B) 64 (C) 72 (D) 96

Answer: (D)

Q. No. 6 – 10 Carry Two Marks Each

6. A shaving set company sells 4 different types of razors, Elegance, Smooth, Soft and Executive. Elegance sells at Rs. 48, Smooth at Rs. 63, Soft at Rs. 78 and Executive at Rs. 173 per piece. The table below shows the numbers of each razor sold in each quarter of a year.

Quarter/Product	Elegance	Smooth	Soft	Executive
Q1	27300	20009	17602	9999
Q2	25222	19392	18445	8942
Q3	28976	22429	19544	10234
Q4	21012	18229	16595	10109

Which product contributes the greatest fraction to the revenue of the company in that year?

(A) Elegance (B) Executive (C) Smooth (D) Soft

Answer: (B)

7. Indian currency notes show the denomination indicated in at least seventeen languages. If this is not an indication of the nation's diversity, nothing else is.

Which of the following can be logically inferred from the above sentences?

(A) India is a country of exactly seventeen languages.

(B) Linguistic pluralism is the only indicator of a nation's diversity.

(C) Indian currency notes have sufficient space for all the Indian languages.

(D) Linguistic pluralism is strong evidence of India's diversity.

Answer: (D)

8. Consider the following statements relating to the level of poker play of four players P, Q, R and S.

I. P always beats Q

II. R always beats S

III. S loses to P only sometimes

IV. R always loses to Q

Which of the following can be logically inferred from the above statements?

(i) P is likely to beat all the three other players

(ii) S is the absolute worst player in the set

(A) (i) only (B) (ii) only (C) (i) and (ii) (D) neither (i) nor (ii)

Answer: (D)

9. If $f(x) = 2x^7 + 3x - 5$, which of the following is a factor of f(x)?

(A) (x^3+8) (B) (x-1) (C) (2x-5) (D) (x+1)

Answer: (B)

10. In a process, the number of cycles to failure decreases exponentially with an increase in load. At a load of 80 units, it takes 100 cycles for failure. When the load is halved, it takes 10000 cycles for failure. The load for which the failure will happen in 5000 cycles is ________.

(A) 40.00 (B) 46.02 (C) 60.01 (D) 92.02

Answer: (B)

Computer Science Engineering

Q. No. 1 – 25 Carry One Mark Each

1. Let p, q, r, s represent the following propositions.

p: $x \in \{8, 9, 10, 11, 12\}$

q: x is a composite number

r: x is a perfect square

s: x is a prime number

The integer $x \geq 2$ which satisfies $\neg((p \Rightarrow q) \wedge (\neg r \vee \neg s))$ is _________.

Answer: (11)

2. Let a_n be the number of n-bit strings that do NOT contain two consecutive 1s. Which one of the following is the recurrence relation for a_n?

(A) $a_n = a_{n-1} + 2a_{n-2}$

(B) $a_n = a_{n-1} + 2a_{n-2}$

(C) $a_n = a_{n-1} + 2a_{n-2}$

(D) $a_n = a_{n-1} + 2a_{n-2}$

Answer: (B)

3. $\lim\limits_{x \to 4} \frac{\sin(x-4)}{x-4} =$__________.

Answer: (1)

4. A probability density function on the interval [a, 1] is given by $1/x^2$ and outside this interval the value of the function is zero. The value of a is___________.

Answer: (0.5)

5. Two eigen values of a 3 × 3 real matrix P are $\left(2+\sqrt{-1}\right)$ and 3. The determinant of P is _________.

Answer: (15)

6. Consider the Boolean operator # with the following properties:

$x \# 0 = x$, $x \# 1 = \overline{x}$, $x \# x = 0$ and $x \# \overline{x} = 1$. Then $x \# y$ is equivalent to

(A) $x\overline{y} + \overline{x}y$ (B) $x\overline{y} + \overline{x}\,\overline{y}$ (C) $\overline{x}y + xy$ (D) $xy + \overline{x}\,\overline{y}$

Answer: (A)

7. The 16-bit 2's complement representation of an integer is 1111 1111 1111 0101; its decimal representation is _________.

Answer: (–11)

8. We want to design a synchronous counter that counts the sequence 0-1-0-2-0-3 and then repeats. The minimum number of J-K flip-flops required to implement this counter is ________.

Answer: (3 - 4)

9. A processor can support a maximum memory of 4 GB, where the memory is word-addressable (a word consists of two bytes). The size of the address bus of the processor is at least __________ bits.

Answer: (31)

10. A queue is implemented using an array such that ENQUEUE and DEQUEUE operations are performed efficiently. Which one of the following statements is **CORRECT** (n refers to the number of items in the queue)?

(A) Both operations can be performed in $O(1)$ time

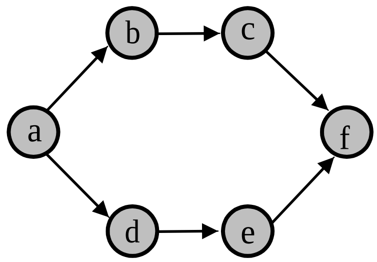
(B) At most one operation can be performed in $O(1)$ time but the worst case time for the other operation will be $\Omega(n)$

(C) The worst case time complexity for both operations will be $\Omega(n)$

(D) Worst case time complexity for both operations will be $\Omega(\log n)$

Answer: (A)

11. Consider the following directed graph:



The number of different topological orderings of the vertices of the graph is __________.

Answer: (6)

12. Consider the following C program.

```
void f(int, short);
void main()  {
int i = 100;
short s = 12;
short *p  = &s;
____________;    // call to f()
}
```

Which one of the following expressions, when placed in the blank above, will NOT result in a type checking error?

(A) `f(s,*s)` (B) `i = f(i,s)` (C) `f(i,*s)` (D) `f(i,*p)`

Answer: (D)

13. The worst case running times of Insertion sort, Merge sort and Quick sort, respectively, are:

(A) $\Theta(n \log n)$, $\Theta(n \log n)$, and $\Theta(n^2)$

(B) $\Theta(n^2)$, $\Theta(n^2)$, and $\Theta(n \log n)$

(C) $\Theta(n^2)$, $\Theta(n \log n)$, and $\Theta(n \log n)$

(D) $\Theta(n^2)$, $\Theta(n \log n)$, and $\Theta(n^2)$

Answer: (D)

14. Let G be a weighted connected undirected graph with distinct positive edge weights. If every edge weight is increased by the same value, then which of the following statements is/are TRUE?

P: Minimum spanning tree of G does not change

Q: Shortest path between any pair of vertices does not change

(A) P only (B) Q only (C) Neither P nor Q (D) Both P and Q

Answer: (A)

15. Consider the following C program.

```
#include<stdio.h>
void mystery(int *ptra, int *ptrb)
{
int *temp;
temp = ptrb;
ptrb = ptra;
ptra = temp;
}
int main() {
int a=2016, b=0, c=4, d=42;
mystery(&a, &b);
if (a < c)
mystery(&c, &a);
mystery(&a, &d);
printf("%d\n", a);
}
```

The output of the program is ______.

Answer: (2016)

16. Which of the following languages is generated by the given grammar?

$S \rightarrow aS|bS|\varepsilon$

(A) $\{a^n b^m \mid n, m \geq 0\}$

(B) $\{w \in \{a, b\}^* \mid w \text{ has equal number of } a\text{'s and } b\text{'s}\}$

(C) $\{a^n \mid n \geq 0\} \cup \{b^n \mid n \geq 0\} \cup \{a^n b^n \mid n \geq 0\}$

(D) $\{a, b\}*$

Answer: (D)

17. Which of the following decision problems are undecidable?

I. Given NFAs N_1 and N_2, is $L(N_1) \cap L(N_2) = \Phi$?

II. Given a CFG $G = (N, \Sigma, P, S)$ and a string $x \in \Sigma*$, does $x \in L(G)$?

III. Given CFGs G1 and G2, is L(G1) = L(G2)?

IV. Given a TM M, is $L(M) = \Phi$?

(A) I and IV only (B) II and III only (C) III and IV only (D) II and IV only

Answer: (C)

18. Which one of the following regular expressions represents the language: the set of all binary strings having two consecutive 0s and two consecutive 1s?

(A) $(0 + 1)*0011(0 + 1)* + (0 + 1)*1100(0 + 1)*$

(B) $(0 + 1)*(00(0 + 1)*11 + 11(0 + 1)*00)(0 + 1)*$

(C) $(0 + 1)*00(0 + 1)* + (0 + 1)*11(0 + 1)*$

(D) $00(0 + 1)*11 + 11(0 + 1)*00$

Answer: (B)

19. Consider the following code segment.

```
x = u - t;
y = x * v;
x = y + w;
y = t - z;
y = x  *  y;
```

The minimum number of total variables required to convert the above code segment to static single assignment form is _________.

Answer: (10)

20. Consider an arbitrary set of CPU-bound processes with unequal CPU burst lengths submitted at the same time to a computer system. Which one of the following process scheduling algorithms would minimize the average waiting time in the ready queue?

(A) Shortest remaining time first

(B) Round-robin with time quantum less than the shortest CPU burst

(C) Uniform random

(D) Highest priority first with priority proportional to CPU burst length

Answer: (A)

21. Which of the following is NOT a super key in a relational schema with attributes V, W, X, Y, Z and primary key V Y ?

(A) V XY Z (B) V W X Z (C) V W XY (D) V W XY Z

Answer: (B)

22. Which one of the following is NOT a part of the ACID properties of database transactions?

(A) Atomicity (B) Consistency (C) Isolation (D) Deadlock-freedom

Answer: (D)

23. A database of research articles in a journal uses the following schema. (VOLUME, NUMBER, STARTPAGE, ENDPAGE, TITLE, YEAR, PRICE)

The primary key is (VOLUME, NUMBER, STARTPAGE, ENDPAGE) and the following functional dependencies exist in the schema.

(VOLUME, NUMBER, STARTPAGE, ENDPAGE) → TITLE

(VOLUME, NUMBER → YEAR

(VOLUME, NUMBER, STARTPAGE, ENDPAGE) → PRICE

The database is redesigned to use the following schemas.

(VOLUME, NUMBER, STARTPAGE, ENDPAGE, TITLE, PRICE) (VOLUME, NUMBER, YEAR)

Which is the weakest normal form that the new database satisfies, but the old one does not?

(A) 1NF (B) 2NF (C) 3NF (D) BCNF

Answer: (B)

24. Which one of the following protocols is NOT used to resolve one form of address to another one?

(A) DNS (B) ARP (C) DHCP (D) RARP

Answer: (C)

25. Which of the following is/are example(s) of stateful application layer protocols?

(i) HTTP (ii) FTP (iii) TCP (iv) POP3

(A) (i) and (ii) only

(B) (ii) and (iii) only

(C) (ii) and (iv) only

(D) (iv) only

Answer: (C)

Q. No. 26 – 55 Carry Two Marks Each

26. The coefficient of x^{12} in $(x^3 + x^4 + x^5 + x^6 + ...)^3$ is ____________.

Answer: **(10)**

27. Consider the recurrence relation $a_1 = 8, a_n = 6n^2 + 2n + a_{n-1}$. Let $a_{99} = K \times 10^4$. The value of K is __________.

Answer: **(198)**

28. A function $f : \mathbb{N}^+ \to \mathbb{N}^+$ defined on the set of positive integers N^+, satisfies the following properties

f (n) = f (n/2) if n is even

f (n) = f (n + 5) if n is odd

Let R = {i | ∃ j: f (j) = i} be the set of distinct values that f takes. The maximum possible size of R is ____________.

Answer: **(2)**

29. Consider the following experiment.

Step 1. Flip a fair coin twice.

Step 2. If the outcomes are (TAILS, HEADS) then output Y and stop.

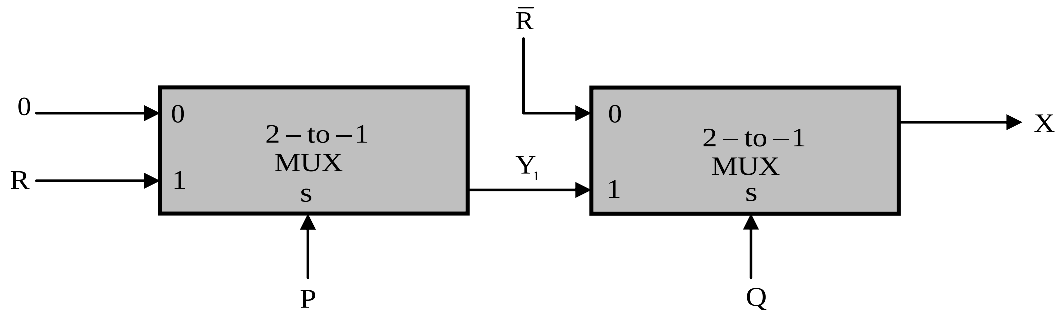
Step 3. If the outcomes are either (HEADS, HEADS) or (HEADS, TAILS), then output N and stop.

Step 4. If the outcomes are (TAILS, TAILS), then go to Step 1.

The probability that the output of the experiment is Y is (up to two decimal places) __________.

Answer: **(0.33)**

30. Consider the two cascaded 2-to-1 multiplexers as shown in the figure.



The minimal sum of products form of the output X is

(A) $\bar{P}\bar{Q} + PQR$ (B) $\bar{P}Q + QR$ (C) $PQ + \bar{P}\bar{Q}R$ (D) $\bar{Q}\bar{R} + PQR$

Answer: (D)

31. The size of the data count register of a DMA controller is 16 bits. The processor needs to transfer a file of 29,154 kilobytes from disk to main memory. The memory is byte addressable. The minimum number of times the DMA controller needs to get the control of the system bus from the processor to transfer the file from the disk to main memory is __________.

Answer: (456)

32. The stage delays in a 4-stage pipeline are 800, 500, 400 and 300 picoseconds. The first stage (with delay 800 picoseconds) is replaced with a functionally equivalent design involving two stages with respective delays 600 and 350 picoseconds. The throughput increase of the pipeline is _________ percent.

Answer: (33.33)

33. Consider a carry look ahead adder for adding two n-bit integers, built using gates of fan-in at most two. The time to perform addition using this adder is

(A) $\Theta(1)$ (B) $\Theta(\log(n))$ (C) $\Theta(\sqrt{n})$ (D) $\Theta(n)$

Answer: (B)

34. The following function computes the maximum value contained in an integer array p[ ] of size n (n >= 1).

```
int max(int *p, int n) {
int a=0, b=n-1;
while ( __________ )     {
if (p[a] <= p[b]) {  a = a+1; }
else                    {  b  = b-1; }
}
return p[a];
}
```

The missing loop condition is

(A) `a != n` (B) `b != 0` (C) `b > (a + 1)` (D) `b != a`

Answer: (D)

35. What will be the output of the following C program?

```
void count(int n){
static int d=1;
printf("%d  ", n); printf("%d  ", d); d++;
if(n>1) count(n-1);
printf("%d  ", d);
}
void main(){
count(3);
}
```

(A) 3 1 2 2 1 3 4 4 4 (B) 3 1 2 1 1 1 2 2 2

(C) 3 1 2 2 1 3 4 (D) 3 1 2 1 1 1 2

Answer: (A)

36. What will be the output of the following pseudo-code when parameters are passed by reference and dynamic scoping is assumed?

```
a=3;
void n(x) {x  = x  *  a; print(x);}
void m(y) {a = 1; a = y  - a; n(a); print(a);}
void main() {m(a);}
```

(A) 6, 2 (B) 6, 6 (C) 4, 2 (D) 4, 4

Answer: (D)

37. An operator delete (i) for a binary heap data structure is to be designed to delete the item in the i-th node. Assume that the heap is implemented in an array and i refers to the i-th index of the array. If the heap tree has depth d (number of edges on the path from the root to the farthest leaf), then what is the time complexity to re-fix the heap efficiently after the removal of the element?

(A) O(1)

(B) O(d) but not O(1)

(C) O(2d) but not O(d)

(D) O(d 2d) but not O(2d)

Answer: (B)

38. Consider the weighted undirected graph with 4 vertices, where the weight of edge {i, j} is given by the entry W_{ij} in the matrix W.

$$W = \begin{bmatrix} 0 & 2 & 8 & 5 \\ 2 & 0 & 5 & 8 \\ 8 & 5 & 0 & x \\ 5 & 8 & x & 0 \end{bmatrix}$$

The largest possible integer value of x, for which at least one shortest path between some pair of vertices will contain the edge with weight x is __________.

Answer: (12)

39. Let G be a complete undirected graph on 4 vertices, having 6 edges with weights being 1, 2, 3, 4, 5, and 6. The maximum possible weight that a minimum weight spanning tree of G can have is ___________.

Answer: (7)

40. G = (V, E) is an undirected simple graph in which each edge has a distinct weight, and e is a particular edge of G. Which of the following statements about the minimum spanning trees (MSTs) of G is/are TRUE?

I. If e is the lightest edge of some cycle in G, then every MST of G includes e

II. If e is the heaviest edge of some cycle in G, then every MST of G excludes e

(A) I only (B) II only (C) both I and II (D) neither I nor II

Answer: (B)

41. Let Q denote a queue containing sixteen numbers and S be an empty stack. Head(Q) returns the element at the head of the queue Q without removing it from Q. Similarly Top(S) returns the element at the top of S without removing it from S. Consider the algorithm given below.

```
while Q is not Empty do
    if S is Empty OR Top(S) ≤ Head(Q) then
        x := Dequeue(Q);
        Push(S, x);
    else
        x := Pop(S);
        Enqueue(Q, x);
    end
end
```

The maximum possible number of iterations of the while loop in the algorithm is __________.

Answer: (256)

42. Consider the following context-free grammars:

G1: $S \rightarrow aS|B,\ B \rightarrow b|bB$

G2: $S \rightarrow aA|bB,\ A \rightarrow aA|B|\varepsilon,\ B \rightarrow bB|\varepsilon$

Which one of the following pairs of languages is generated by G1 and G2, respectively?

(A) $\{a^mb^n|m > 0 \text{ or } n > 0\}$ and $\{a^mb^n|m > 0 \text{ and } n > 0\}$

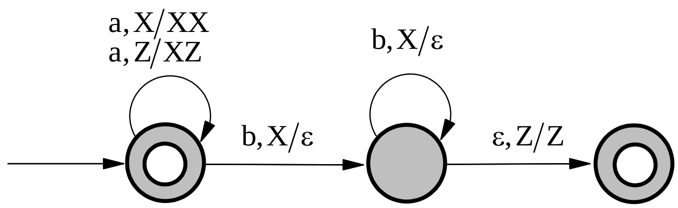
(B) $\{a^mb^n|m > 0 \text{ and } n > 0\}$ and $\{a^mb^n|m > 0 \text{ or } n \leq 0\}$

(C) $\{a^mb^n|m \geq 0 \text{ or } n > 0\}$ and $\{a^mb^n|m > 0 \text{ and } n > 0\}$

(D) $\{a^mb^n|m \geq 0 \text{ or } n > 0\}$ and $\{a^mb^n|m > 0 \text{ or } n > 0\}$

Answer: (D)

43. Consider the transition diagram of a PDA given below with input alphabet $\Sigma = \{a, b\}$ and stack alphabet $\Gamma = \{X, Z\}$. Z is the initial stack symbol. Let L denote the language accepted by the PDA.



Which one of the following is TRUE?

(A) $L = \{a^nb^n|n \geq 0\}$ and is not accepted by any finite automata

(B) $L = \{a^n|n \geq 0\} \cup \{a^nb^n|n \geq 0\}$ and is not accepted by any deterministic PDA

(C) L is not accepted by any Turing machine that halts on every input

(D) $L = \{a^n|n \geq 0\} \cup \{a^nb^n|n \geq 0\}$ and is deterministic context-free

Answer: (D)

44. Let X be a recursive language and Y be a recursively enumerable but not recursive language. Let W and Z be two languages such that Y reduces to W, and Z reduces to X (reduction means the standard many-one reduction). Which one of the following statements is TRUE?

(A) W can be recursively enumerable and Z is recursive.

(B) W can be recursive and Z is recursively enumerable.

(C) W is not recursively enumerable and Z is recursive.

(D) W is not recursively enumerable and Z is not recursive.

Answer: (C)

45. The attributes of three arithmetic operators in some programming language are given below.

Operator	**Precedence**	**Associativity**	**Arity**
$+$	High	Left	Binary
$-$	Medium	Right	Binary
$*$	Low	Left	Binary

The value of the expression $2 - 5 + 1 - 7 * 3$ in this language is .

Answer: (9)

46. Consider the following Syntax Directed Translation Scheme (SDTS), with non-terminals {S, A} and terminals {a, b}.

$$S \rightarrow aA \ \{\text{print } 1\}$$
$$S \rightarrow a \quad \{\text{print } 2\}$$
$$A \rightarrow Sb \ \{\text{print } 3\}$$

Using the above SDTS, the output printed by a bottom-up parser, for the input aab is:

(A) 1 3 2 (B) 2 2 3 (C) 2 3 1 (D) syntax error

Answer: (C)

47. Consider a computer system with 40-bit virtual addressing and page size of sixteen kilobytes. If the computer system has a one-level page table per process and each page table entry requires 48 bits, then the size of the per-process page table is _________ megabytes.

Answer: (384)

48. Consider a disk queue with requests for I/O to blocks on cylinders 47, 38, 121, 191, 87, 11, 92, 10. The C-LOOK scheduling algorithm is used. The head is initially at cylinder number 63, moving towards larger cylinder numbers on its servicing pass. The cylinders are numbered from 0 to 199. The total head movement (in number of cylinders) incurred while servicing these requests is __________.

Answer: (346)

49. Consider a computer system with ten physical page frames. The system is provided with an access sequence ($a_1, a_2, \ldots, a_{20}, a_1, a_2, \ldots, a_{20}$), where each a_i is a distinct virtual page number. The difference in the number of page faults between the last-in-first-out page replacement policy and the optimal page replacement policy is __________.

Answer: (1)

50. Consider the following proposed solution for the critical section problem. There are n processes: $P_0 \ldots P_{n-1}$. In the code, function pmax returns an integer not smaller than any of its arguments. For all i, t[i] is initialized to zero.

```
Code for Pi:
do  {
c[i]=1; t[i] = pmax(t[0],. . .,t[n-1])+1;  c[i]=0;
for every j = i in {0,. . .,n-1}  {
while (c[j]);
    while (t[j] != 0  &&  t[j]<=t[i]);
    }
    Critical Section;
    t[i]=0;
    Remainder Section;
}   while (true);
```

Which one of the following is TRUE about the above solution?

(A) At most one process can be in the critical section at any time

(B) The bounded wait condition is satisfied

(C) The progress condition is satisfied

(D) It cannot cause a deadlock

Answer: (A)

51. Consider the following two phase locking protocol. Suppose a transaction T accesses (for read or write operations), a certain set of objects $\{O_1, \ldots, O_k\}$. This is done in the following manner:

Step 1: T acquires exclusive locks to O1, . . . , Ok in increasing order of their addresses.

Step 2: The required operations are performed.

Step 3: All locks are released.

This protocol will

(A) guarantee serializability and deadlock-freedom

(B) guarantee neither serializability nor deadlock-freedom

(C) guarantee serializability but not deadlock-freedom

(D) guarantee deadlock-freedom but not serializability

Answer: (A)

52. Consider that B wants to send a message m that is digitally signed to A. Let the pair of private and public keys for A and B be denoted by K_x^- and K_x^+ for x = A, B, respectively. Let $K_x(m)$ represent the operation of encrypting m with a key Kx and H (m) represent the message digest. Which one of the following indicates the CORRECT way of sending the message m along with the digital signature to A?

(A) $\{m, K_B^+(H(m))\}$ (B) $\{m, K_B^-(H(m))\}$

(C) $\{m, K_A^-(H(m))\}$ (D) $\{m, K_A^+(m)\}$

Answer: (B)

53. An IP datagram of size 1000 bytes arrives at a router. The router has to forward this packet on a link whose MTU (maximum transmission unit) is 100 bytes. Assume that the size of the IP header is 20 bytes.

The number of fragments that the IP datagram will be divided into for transmission is ________.

Answer: (13)

54. For a host machine that uses the token bucket algorithm for congestion control, the token bucket has a capacity of 1 megabyte and the maximum output rate is 20 megabytes per second. Tokens arrive at a rate to sustain output at a rate of 10 megabytes per second. The token bucket is currently full and the machine needs to send 12 megabytes of data. The minimum time required to transmit the data is _______ seconds.

Answer: (1.1)

55. A sender uses the Stop-and-Wait ARQ protocol for reliable transmission of frames. Frames are of size 1000 bytes and the transmission rate at the sender is 80 Kbps (1Kbps = 1000 bits/second). Size of an acknowledgement is 100 bytes and the transmission rate at the receiver is 8 Kbps. The one-way propagation delay is 100 milliseconds.

Assuming no frame is lost, the sender throughput is __________ bytes/second.

Answer: (2500)

GENERAL APTITUDE

Q. No. 1 – 5 Carry One Mark Each

1. The man who is now Municipal Commissioner worked as _____________.

(A) the security guard at a university

(B) a security guard at the university

(C) a security guard at university

(D) the security guard at the university

Answer: (B)

2. Nobody knows how the Indian cricket team is going to <u>cope with</u> the difficult and seamer-friendly wickets in Australia.

Choose the option which is closest in meaning to the underlined phase in the above sentence.

(A) put up with (B) put in with (C) put down to (D) put up against

Answer: (A)

3. Find the odd one in the following group of words.

Mock, deride, praise, jeer

(A) mock (B) deride (C) praise (D) jeer

Answer: (C)

4. Pick the odd one from the following options.

(A) CADBE (B) JHKIL (C) XVYWZ (D) ONPMQ

Answer: (D)

5. In a quadratic function, the value of the product of the roots (α, β) is 4. Find the value of $\dfrac{\alpha^n + \beta^n}{\alpha^{-n} + \beta^{-n}}$

(A) n^4 (B) 4^n (C) 2^{2n-1} (D) 4^{n-1}

Answer: (B)

Q. No. 6 – 10 Carry Two Marks Each

6. Among 150 faculty members in an institute, 55 are connected with each other through Facebook and 85 are connected through WhatsApp. 30 faculty members do not have Facebook or WhatsApp accounts. The number of faculty members connected only through Facebook accounts is ___________.

(A) 35 (B) 45 (C) 65 (D) 90

Answer: (A)

7. Computers were invented for performing only high-end useful computations. However, it is no understatement that they have taken over our world today. The internet, for example, is ubiquitous. Many believe that the internet itself is an unintended consequence of the original invention with the advent of mobile computing on our phones, a whole new dimension is now enabled. One is left wondering if all these developments are good or more importantly, required.

Which of the statement(s) below is/are logically valid and can be inferred from the above paragraph?

(i) The author believes that computers are not good for us

(ii) Mobile computers and the internet are both intended inventions

(A) (i) only (B) (ii) only

(C) both (i) and (ii) (D) neither (i) nor (ii)

Answer: (D)

8. All hill-stations have a lake. Ooty has two lakes.

Which of the statement(s) below is/are logically valid and can be inferred from the above sentences?

(i) Ooty is not a hill-station

(ii) No hill-station can have more than one lake.

(A) (i) Only (B) (ii) Only

(C) Both (i) and (ii) (D) neither (i) nor (ii)

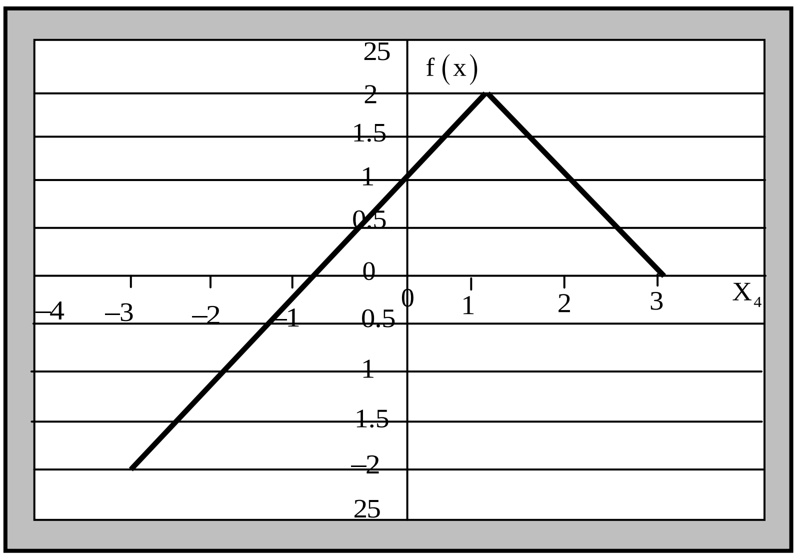
Answer: (D)

9. In a 2×4 rectangle grid shown below, each cell is a rectangle. How many rectangles can be observed in the grid?

(A) 21 (B) 27 (C) 30 (D) 36

Answer: (C)

10. Choose the correct expression for f(x) given in the graph.



(A) $f(x) = 1 - |x-1|$

(B) $f(x) = 1 + |x-1|$

(C) $f(x) = 2 - |x-1|$

(D) $f(x) = 2 + |x-1|$

Answer: (C)

COMPUTER SCIENCE ENGINEERING

Q. No. 1 – 25 Carry One Mark Each

1. Consider the following expressions:

(i) false **(ii)** Q **(iii)** true

(iv) $P \vee Q$ **(v)** $\neg Q \vee P$

The number of expressions given above that are logically implied by $P \wedge (P \Rightarrow Q)$ is________.

Answer: (4)

2. Let f (x) be a polynomial and g(x) = f '(x) be its derivative. If the degree of (f (x) + f (−x)) is 10, then the degree of (g(x) − g(−x)) is __________.

Answer: (9)

3. The minimum number of colours that is sufficient to vertex-colour any planar graph is _________.

Answer: (4)

4. Consider the systems, each consisting of m linear equations in n variables.

I. If m < n, then all such systems have a solution

II. If m > n, then none of these systems has a solution

III. If m = n, then there exists a system which has a solution

Which one of the following is CORRECT?

(A) I, II and III are true (B) Only II and III are true

(C) Only III is true (D) None of them is true

Answer: (C)

5. Suppose that a shop has an equal number of LED bulbs of two different types. The probability of an LED bulb lasting more than 100 hours given that it is of Type 1 is 0.7, and given that it is of Type 2 is 0.4. The probability that an LED bulb chosen uniformly at random lasts more than 100 hours is __________.

Answer: (0.55)

6. Suppose that the eigen values of matrix A are 1, 2, 4. The determinant of $(A^{-1})^T$ is _________.

Answer: (0.125)

7. Consider an eight-bit ripple-carry adder for computing the sum of A and B, where A and B are integers represented in 2's complement form. If the decimal value of A is one, the decimal value of B that leads to the longest latency for the sum to stabilize is __________.

Answer: (-1)

8. Let, $x_1 \oplus x_2 \oplus x_3 \oplus x_4 = 0$ where x_1, x_2, x_3, x_4 are Boolean variables, and $\oplus$ is the XOR operator.

Which one of the following must always be TRUE?

(A) $x_1x_2x_3x_4 = 0$

(B) $x_1x_3 + x_2 = 0$

(C) $\bar{x}_1 \oplus \bar{x}_3 = \bar{x}_2 \oplus \bar{x}_4$

(D) $x_1 + x_2 + x_3 + x_4 = 0$

Answer: (C)

9. Let X be the number of distinct 16-bit integers in 2's complement representation. Let Y be the number of distinct 16-bit integers in sign magnitude representation.

Then $X - Y$ is __________.

Answer: (1)

10. A processor has 40 distinct instructions and 24 general purpose registers. A 32-bit instruction word has an opcode, two register operands and an immediate operand. The number of bits available for the immediate operand field is _________.

Answer: (16)

11. Breadth First Search (BFS) is started on a binary tree beginning from the root vertex. There is a vertex t at a distance four from the root. If t is the n-th vertex in this BFS traversal, then the maximum possible value of n is _________.

Answer: (31)

12. The value printed by the following program is __________.

```
void f(int* p, int m){
    m = m + 5;
    *p = *p + m;
    return;
}
void main(){
    int i=5, j=10;
    f(&i, j);
    printf("%d", i+j);
}
```

Answer: (30)

13. Assume that the algorithms considered here sort the input sequences in ascending order. If the input is already in ascending order, which of the following are TRUE?

I. Quick sort runs in $\Theta(n^2)$ time

II. Bubble sort runs in $\Theta(n^2)$ time

III. Mergesort runs in $\Theta(n)$ time

IV. Insertion sort runs in $\Theta(n)$ time

(A) I and II only
(B) I and III only
(C) II and IV only
(D) I and IV only

Answer: (D)

14. The Floyd-Warshall algorithm for all-pair shortest paths computation is based on

(A) Greedy paradigm
(B) Divide-and-Conquer paradigm.
(C) Dynamic Programming paradigm.
(D) Neither Greedy nor Divide-and-Conquer nor Dynamic Programming paradigm

Answer: (C)

15. N items are stored in a sorted doubly linked list. For a delete operation, a pointer is provided to the record to be deleted. For a decrease-key operation, a pointer is provided to the record on which the operation is to be performed.

An algorithm performs the following operations on the list in this order: $\Theta(N)$ delete, $O(\log N)$ insert, $O(\log N)$ find, and $\Theta(N)$ decrease-key. What is the time complexity of all these operations put together?

(A) $O(\log^2 N)$ (B) $O(N)$ (C) $O(N^2)$ (D) $\Theta(N^2 \log N)$

Answer: (C)

16. The number of states in the minimum sized DFA that accepts the language defined by the regular expression

$(0 + 1)*(0 + 1)(0 + 1)*$ is _________.

Answer: (2)

17. Language L_1 is defined by the grammar: $S_1 \rightarrow aS_1b|\varepsilon$

Language L_2 is defined by the grammar: $S_2 \rightarrow abS_2|\varepsilon$

Consider the following statements:

P: L_1 is regular

Q: L_2 is regular

Which one of the following is TRUE?

(A) Both P and Q are true (B) P is true and Q is false

(C) P is false and Q is true (D) Both P and Q are false

Answer: (C)

18. Consider the following types of languages: L_1: Regular, L_2: Context-free, L_3: Recursive, L_4: Recursively enumerable. Which of the following is/are TRUE?

I. $\bar{L}_3 \cup L_4$ is recursively enumerable

II. $\bar{L}_2 \cup L_3$ is recursive

III. $L_1^* \cap L_2$ is context-free

IV. $L_1 \cup \bar{L}_2$ is context-free

(A) I only (B) I and III only (C) I and IV only (D) I, II and III only

Answer: (D)

19. Match the following:

(P)	Lexical analysis	(i)	Leftmost derivation
(Q)	Top down parsing	(ii)	Type checking
(R)	Semantic analysis	(iii)	Regular expressions
(S)	Runtime environments	(iv)	Activation records

(A) P ↔ i, Q ↔ ii, R ↔ iv, S ↔ iii
(B) P ↔ iii, Q ↔ i, R ↔ ii, S ↔ iv
(C) P ↔ ii, Q ↔ iii, R ↔ i, S ↔ iv
(D) P ↔ iv, Q ↔ i, R ↔ ii, S ↔ iii

Answer: (B)

20. In which one of the following page replacement algorithms it is possible for the page fault rate to increase even when the number of allocated frames increases?

(A) LRU (Least Recently Used)
(B) OPT (Optimal Page Replacement)
(C) MRU (Most Recently Used)
(D) FIFO (First In First Out)

Answer: (D)

21. B+ Trees are considered BALANCED because

(A) the lengths of the paths from the root to all leaf nodes are all equal.
(B) the lengths of the paths from the root to all leaf nodes differ from each other by at most 1.
(C) the number of children of any two non-leaf sibling nodes differ by at most 1.
(D) the number of records in any two leaf nodes differ by at most 1.

Answer: (A)

22. Suppose a database schedule S involves transactions $T_1, \ldots, T_n$. Construct the precedence graph of S with vertices representing the transactions and edges representing the conflicts. If S is serializable, which one of the following orderings of the vertices of the precedence graph is guaranteed to yield a serial schedule?

(A) Topological order
(B) Depth-first order
(C) Breadth-first order
(D) Ascending order of transaction indices

Answer: (A)

23. Anarkali digitally signs a message and sends it to Salim. Verification of the signature by Salim requires

(A) Anarkali's public key (B) Salim's public key

(C) Salim's private key (D) Anarkali's private key

Answer: (A)

24. In an Ethernet local area network, which one of the following statements is TRUE?

(A) A station stops to sense the channel once it starts transmitting a frame.

(B) The purpose of the jamming signal is to pad the frames that are smaller than the minimum frame size.

(C) A station continues to transmit the packet even after the collision is detected.

(D) The exponential backoff mechanism reduces the probability of collision on retransmissions.

Answer: (D)

25. Identify the correct sequence in which the following packets are transmitted on the network by a host when a browser requests a webpage from a remote server, assuming that the host has just been restarted.

(A) HTTP GET request, DNS query, TCP SYN

(B) DNS query, HTTP GET request, TCP SYN

(C) DNS query, TCP SYN, HTTP GET request

(D) TCP SYN, DNS query, HTTP GET request

Answer: (C)

Q. No. 26 – 55 Carry Two Marks Each

26. A binary relation R on N × N is defined as follows: (a, b)R(c, d) if $a \le c$ or $b \le d$. Consider the following propositions:

P: R is reflexive

Q: R is transitive

Which one of the following statements is TRUE?

(A) Both P and Q are true (B) P is true and Q is false

(C) P is false and Q is true (D) Both P and Q are false

Answer: (B)

27. Which one of the following well-formed formulae in predicate calculus is NOT valid?

(A) $(\forall x\, p(x) \Rightarrow \forall x\, q(x)) \Rightarrow (\exists x \neg p(x) \vee \forall x\, q(x))$

(B) $(\exists x\, p(x) \vee \exists x\, q(x)) \Rightarrow \exists x\, (p(x) \vee q(x))$

(C) $\exists x\, (p(x) \wedge q(x)) \Rightarrow (\exists x\, p(x) \wedge \exists x\, q(x))$

(D) $\forall x\, (p(x) \vee q(x)) \Rightarrow (\forall x\, p(x) \vee \forall x\, q(x))$

Answer: (D)

28. Consider a set U of 23 different compounds in a Chemistry lab. There is a subset S of U of 9 compounds, each of which reacts with exactly 3 compounds of U. Consider the following statements:

I. Each compound in U \ S reacts with an odd number of compounds.

II. At least one compound in U \ S reacts with an odd number of compounds.

III. Each compound in U \ S reacts with an even number of compounds.

Which one of the above statements is ALWAYS TRUE?

(A) Only I (B) Only II (C) Only III (D) None of these

Answer: (B)

29. The value of the expression 13^{99}(mod 17), in the range 0 to 16, is __________.

Answer: (4)

30. Suppose the functions F and G can be computed in 5 and 3 nanoseconds by functional units U_F and U_G, respectively. Given two instances of U_F and two instances of U_G, it is required to implement the computation F $(G(X_i))$ for $1 \leq i \leq 10$. Ignoring all other delays, the minimum time required to complete this computation is _________ nanoseconds.

Answer: (28)

31. Consider a processor with 64 registers and an instruction set of size twelve. Each instruction has five distinct fields, namely, opcode, two source register identifiers, one destination register identifier, and a twelve-bit immediate value. Each instruction must be stored in memory in a byte-aligned fashion. If a program has 100 instructions, the amount of memory (in bytes) consumed by the program text is _________.

Answer: (500)

32. The width of the physical address on a machine is 40 bits. The width of the tag field in a 512 KB 8-way set associative cache is _________ bits.

Answer: (24)

33. Consider a 3 GHz (gigahertz) processor with a three-stage pipeline and stage latencies τ_1, τ_2, and τ_3 such that $\tau_1 = 3\tau_2/4 = 2\tau_3$. If the longest pipeline stage is split into two pipeline stages of equal latency, the new frequency is ________ GHz, ignoring delays in the pipeline registers.

Answer: (4)

34. A complete binary min-heap is made by including each integer in [1, 1023] exactly once.

The depth of a node in the heap is the length of the path from the root of the heap to that node.

Thus, the root is at depth 0. The maximum depth at which integer 9 can appear is _________.

Answer: (8)

35. The following function computes XY for positive integers X and Y.

```
int exp(int X,  int Y)
{
int res = 1, a = X,  b  = Y;
while ( b  != 0  ){
if ( b%2 == 0) {  a = a*a; b  = b/2; }
else           {  res = res*a; b  = b-1; }
}
return res;
}
```

Which one of the following conditions is TRUE before every iteration of the loop?

(A) $X^Y = a^b$ (B) $(res * a)^Y = (res * X)^b$

(C) $X^Y = res * a^b$ (D) $X^Y = (res * a)^b$

Answer: (C)

36. Consider the following New-order strategy for traversing a binary tree:

- Visit the root;
- Visit the right subtree using New-order;
- Visit the left subtree using New-order;

The New-order traversal of the expression tree corresponding to the reverse polish expression

3 4 * 5 − 2 ˆ 6 7 * 1 + − is given by:

(A) + − 1 6 7 * 2 ˆ 5 − 3 4 *

(B) − + 1 * 6 7 ˆ 2 − 5 * 3 4

(C) − + 1 * 7 6 ˆ 2 − 5 * 4 3

(D) 1 7 6 * + 2 5 4 3 * − ˆ −

Answer: (C)

37. Consider the following program:

```
int f(int *p, int n)
    {
```

```
    if (n <= 1) return 0;
    else return max(f(p+1,n-1),p[0]-p[1]);
}
int main()
{
    int a[ ] = {3,5,2,6,4};
    printf("%d", f(a,5));
    }
```

Note: max(x,y) returns the maximum of x and y.

The value printed by this program is __________.

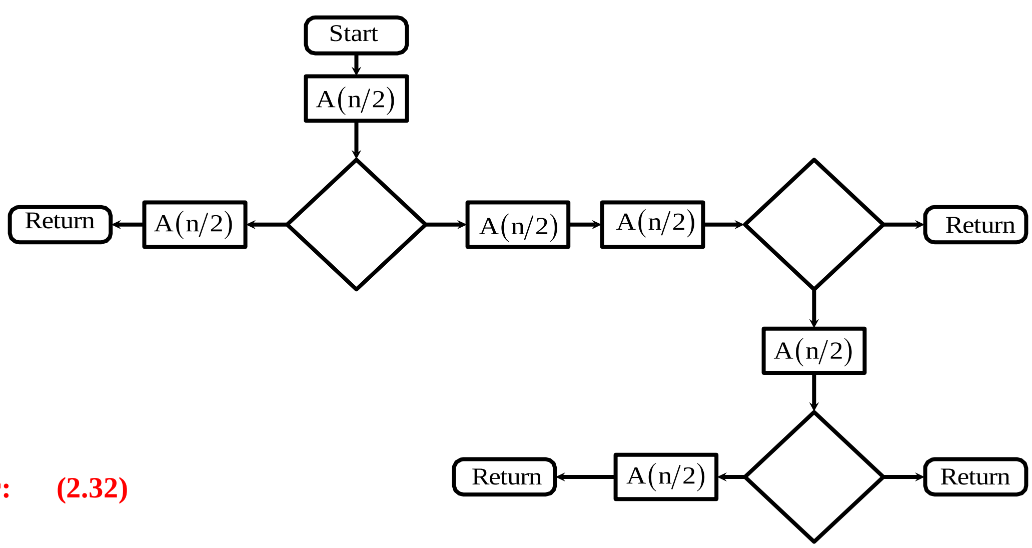
Answer: (3)

38. Let A_1, A_2, A_3, and A_4 be four matrices of dimensions 10×5, 5×20, 20×10, and 10×5, respectively. The minimum number of scalar multiplications required to find the product $A_1 A_2 A_3 A_4$ using the basic matrix multiplication method is __________.

Answer: (1500)

39. The given diagram shows the flowchart for a recursive function A(n). Assume that all statements, except for the recursive calls, have O(1) time complexity. If the worst case time complexity of this function is $O(n^{\alpha})$, then the least possible value (accurate up to two decimal positions) of α is _________.

Flowchart for Recursive Function A(n)



Answer: (2.32)

40. The number of ways in which the numbers 1, 2, 3, 4, 5, 6, 7 can be inserted in an empty binary search tree, such that the resulting tree has height 6, is _________.

Note: The height of a tree with a single node is 0.

Answer: (64)

41. In an adjacency list representation of an undirected simple graph G = (V, E), each edge (u, v) has two adjacency list entries: [v] in the adjacency list of u, and [u] in the adjacency list of v. These are called twins of each other. A twin pointer is a pointer from an adjacency list entry to its twin. If |E | = m and |V | = n, and the memory size is not a constraint, what is the time complexity of the most efficient algorithm to set the twin pointer in each entry in each adjacency list?

(A) $\Theta(n^2)$ (B) $\Theta(n+m)$ (C) $\Theta(m^2)$ (D) $\Theta(n^4)$

Answer: (B)

42. Consider the following two statements:

I. If all states of an NFA are accepting states then the language accepted by the NFA is Σ^*.

II. There exists a regular language A such that for all languages B, $A \cap B$ is regular. Which one of the following is CORRECT?

(A) Only I is true (B) Only II is true

(C) Both I and II are true (D) Both I and II are false

Answer: (B)

43. Consider the following languages:

$L_1 = \{a^n b^m c^{n+m}: m, n \geq 1\}$

$L_2 = \{a^n b^n c^{2n}: n \geq 1\}$

Which one of the following is TRUE?

(A) Both L_1 and L_2 are context-free.

(B) L_1 is context-free while L_2 is not context-free.

(C) L_2 is context-free while L_1 is not context-free.

(D) Neither L_1 nor L_2 is context-free.

Answer: (B)

44. Consider the following languages.

$L_1 = \{\langle M \rangle \mid M$ takes at least 2016 steps on some input$\}$,

$L_2 = \{\langle M \rangle \mid M$ takes at least 2016 steps on all inputs$\}$ and

$L_3 = \{\langle M \rangle \mid M$ accepts $\varepsilon\}$,

where for each Turing machine M, $\langle M \rangle$ denotes a specific encoding of M. Which one of the following is TRUE?

(A) L_1 is recursive and L_2, L_3 are not recursive

(B) L_2 is recursive and L_1, L_3 are not recursive

(C) L_1, L_2 are recursive and L_3 is not recursive

(D) L_1, L_2, L_3 are recursive

Answer: (C)

45. Which one of the following grammars is free from left recursion?

(A)
$S \to AB$
$A \to Aa \mid b$
$B \to c$

(B)
$S \to Ab \mid Bb \mid c$
$A \to Bd \mid \varepsilon$
$B \to e$

(C)
$S \to Aa \mid B$
$A \to Bb \mid Sc \mid \varepsilon$

(D)
$S \to Aa \mid Bb \mid c$
$A \to Bd \mid \varepsilon$
$B \to Ae \mid \varepsilon$

Answer: (B)

46. A student wrote two context-free grammars G1 and G2 for generating a single C-like array declaration. The dimension of the array is at least one. For example,

```
int a[10][3];
```

The grammars use D as the start symbol, and use six terminal symbols int ; id [ ] num.

Grammar G1	**Grammar G2**
`D → int L;`	`D → int L;`
`L → id [E`	`L → id E`
`E → num]`	`E → E [num]`
`E → num] [E`	`E → [num]`

Which of the grammars correctly generate the declaration mentioned above?

(A) Both G1 and G2 (B) Only G1

(C) Only G2 (D) Neither G1 nor G2

Answer: (A)

47. Consider the following processes, with the arrival time and the length of the CPU burst given in milliseconds. The scheduling algorithm used is preemptive shortest remaining-time first.

Process	Arrival Time	Burst Time
P_1	0	10
P_2	3	6
P_3	7	1
P_4	8	3

The average turnaround time of these processes is _________ milliseconds.

Answer: (8.25)

48. Consider the following two-process synchronization solution

Process 0

```
Entry: loop while (turn == 1);
     (critical section)
Exit:  turn = 1;
```

Process 1

```
Entry: loop while (turn == 0);
     (critical section)
Exit:  turn = 0;
```

The shared variable turn is initialized to zero. Which one of the following is TRUE?

(A) This is a correct two-process synchronization solution.

(B) This solution violates mutual exclusion requirement.

(C) This solution violates progress requirement.

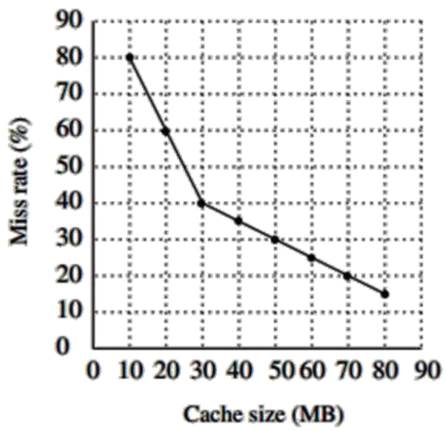
(D) This solution violates bounded wait requirement.

Answer: (C)

49. Consider a non-negative counting semaphore S. The operation P(S) decrements S, and V (S) increments S. During an execution, 20 P(S) operations and 12 V (S) operations are issued in some order. The largest initial value of S for which at least one P(S) operation will remain blocked is ___________.

Answer: **(7)**

50. A file system uses an in-memory cache to cache disk blocks. The miss rate of the cache is shown in the figure. The latency to read a block from the cache is 1ms and to read a block from the disk is 10ms. Assume that the cost of checking whether a block exists in the cache is negligible. Available cache sizes are in multiples of 10 MB.



The smallest cache size required to ensure an average read latency of less than 6 ms is _________ MB.

Answer: **(30)**

51. Consider the following database schedule with two transactions, T_1 and T_2.

$$S = r_2(X); r_1(X); r_2(Y); w_1(X); r_1(Y); w_2(X); a_1; a_2$$

where $r_i(Z)$ denotes a read operation by transaction T_i on a variable Z, $w_i(Z)$ denotes a write operation by T_i on a variable Z and a_i denotes an abort by transaction Ti.

Which one of the following statements about the above schedule is TRUE?

(A) S is non-recoverable

(B) S is recoverable, but has a cascading abort

(C) S does not have a cascading abort

(D) S is strict

Answer: **(C)**

52. Consider the following database table named water_schemes:

Water_schemes		
Scheme_no	**District_name**	**Capacity**
1	Ajmeer	20
1	Bikaner	10
2	Bikaner	10
3	Bikaner	20
1	Churu	10
2	Churu	20
1	Dungargarh	10

The number of tuples returned by the following SQL query is ___________.

```
with  total(name, capacity) as
     select  district_name, sum(capacity)
     from  water_schemes
     group by  district_name
with  total_avg(capacity) as select  avg(capacity)
     from  total
select  name
     from  total, total_avg
     where  total.capacity ≥  total_avg.capacity
```

Answer: (2)

53. A network has a data transmission bandwidth of 20×10^6 bits per second. It uses CSMA/CD in the MAC layer. The maximum signal propagation time from one node to another node is 40 microseconds. The minimum size of a frame in the network is __________ bytes.

Answer: (200)

54. For the IEEE 802.11 MAC protocol for wireless communication, which of the following statements is/are TRUE?

I. At least three non-overlapping channels are available for transmissions.

II. The RTS-CTS mechanism is used for collision detection.

III. Unicast frames are ACKed.

(A) All I, II, and III (B) I and III only

(C) II and III only (D) II only

Answer: (B)

55. Consider a 128×10^3 bits/second satellite communication link with one way propagation delay of 150 milliseconds. Selective retransmission (repeat) protocol is used on this link to send data with a frame size of 1 kilobyte. Neglect the transmission time of acknowledgement. The minimum number of bits required for the sequence number field to achieve 100% utilization is _________.

Answer: (4)

Q. No. 1 – 5 Carry One Mark Each

1. Which of the following options is the closest in meaning to the phrase underlined in the sentence below?
It is fascinating to see life forms <u>cope with</u> varied environmental conditions.
(A) Adopt to (B) Adapt to (C) Adept in (D) Accept with

Answer: (B)

2. Choose the most appropriate word from the options given below to complete the following sentence.
He could not understand the judges awarding her the first prize, because he thought that her performance was quite ___________________.
(A) Superb (B) Medium (C) Mediocre (D) Exhilarating

Answer: (C)

3. In a press meet on the recent scam, the minister said, "The buck stops here". What did the minister convey by the statement?
(A) He wants all the money (B) He will return the money
(C) He will assume final responsibility (D) He will resist all enquiries

Answer: (C)

4. If $(z+1/z)^2 = 98$, compute $\left(z^2+1/z^2\right)$

Answer: (96)

Exp: Expanding

$$z^2+\frac{1}{z^2}+2.z.\frac{1}{z}=98 \Rightarrow z^2+\frac{1}{z^2}=96$$

5. The roots of $ax^2+bx+c=0$ are real and positive a, b and c are real. Then $ax^2+b|x|+c=0$ has
(A) No roots (B) 2 real roots (C) 3 real roots (D) 4 real roots

Answer: (D)

Exp: $ax^2+bx+c=0$
for roots to be real & +ve
$b^2-4ac>0$
This will have 2 real positive roots.
$ax^2+b|x|+c=0$
This can be written as;
ax^2+bx+c
$\text{Discri min ant} = b^2-4ac>0$
ax^2-bx+c
$(-b)^2-4ac$
$\Rightarrow b^2-4ac$
Is also >0. This will have real roots
$\Rightarrow$ This will have 4 real roots.

Q.No. 6 – 10 Carry One Mark Each

6. The Palghat Gap (or Palakkad Gap), a region about 30 km wide in the southern part of the Western Ghats in India, is lower than the hilly terrain to its north and south. The exact reasons for the formation of this gap are not clear. It results in the neighbouring regions of Tamil Nadu getting more rainfall from the South West monsoon and the neighbouring regions of Kerala having higher summer temperatures.

What can be inferred from this passage?

(A) The Palghat gap is caused by high rainfall and high temperatures in southern Tamil Nadu and Kerala

(B) The regions in Tamil Nadu and Kerala that are near the Palghat Gap are low–lying

(C) The low terrain of the Palghat Gap has a significant impact on weather patterns in neighbouring parts of Tamil Nadu and Kerala

(D) Higher summer temperatures result in higher rainfall near the Palghat Gap area

Answer: (C)

7. Geneticists say that they are very close to confirming the genetic roots of psychiatric illnesses such as depression and schizophrenia, and consequently, that doctors will be able to eradicate these diseases through early identification and gene therapy.

On which of the following assumptions does the statement above rely?

(A) Strategies are now available for eliminating psychiatric illnesses

(B) Certain psychiatric illnesses have a genetic basis

(C) All human diseases can be traced back to genes and how they are expressed

(D) In the future, genetics will become the only relevant field for identifying psychiatric illnesses

Answer: (B)

8. Round–trip tickets to a tourist destination are eligible for a discount of 10% on the total fare. In addition, groups of 4 or more get a discount of 5% on the total fare. If the one way single person fare is Rs 100, a group of 5 tourists purchasing round–trip tickets will be charged Rs ____________

Answer: (850)

Exp: One way force =100

Two way fare per person=200

5 persons=1000/-

Total discount applicable=10+5=15%

$\text{Discount amount} = \frac{15}{100} \times 1000 = 150$

Amount to be paid=1000-150=850

9. In a survey, 300 respondents were asked whether they own a vehicle or not. If yes, they were further asked to mention whether they own a car or scooter or both. Their responses are tabulated below. What percent of respondents do not own a scooter?

		Men	Women
Own vehicle	Car	40	34
	Scooter	30	20
	Both	60	46
Do not own vehicle		20	50

Answer: (48)

Exp: Total respondents=300

Those who don't have scooter

$\Rightarrow$ Men= 40+20=60

$$\text{Women} = 34 + 50 = \frac{84}{144}$$

$$\% = \frac{144}{300} \times 100 = 48\%$$

10. When a point inside of a tetrahedron (a solid with four triangular surfaces) is connected by straight lines to its corners, how many (new) internal planes are created with these lines? ________________

Answer: (6)

Q. No. 1 – 25 Carry One Mark Each

1. Consider the statement:

“Not all that glitters is gold”

Predicate glitters (x) is true if x glitters and predicate gold (x) is true if x is gold. Which one of the following logical formulae represents the above statement?

(A) $\forall x;\ \text{glitters}(x) \Rightarrow \neg \text{gold}(x)$ (B) $\forall x;\ \text{gold}(x) \Rightarrow \text{glitters}(x)$

(C) $\exists x;\ \text{gold}(x) \wedge \neg \text{glitters}(x)$ (D) $\exists x;\ \text{glitters}(x) \wedge \neg \text{gold}(x)$

Answer: (D)

Exp: It means “It is false that every glitter is gold” or “some glitters are not gold”.

Then we can say “atleast one glitter object is not gold”.

2. Suppose you break a stick of unit length at a point chosen uniformly at random. Then the expected length of the shorter stick is ________ .

Answer: (0.25)

Exp: The smaller sticks, therefore, will range in length from almost 0 meters up to a maximum of 0.5 meters, with each length equally possible.

Thus, the average length will be about 0.25 meters, or about a quarter of the stick.

3. Let G=(V,E) be a directed graph where *V* is the set of vertices and *E* the set of edges. Then which one of the following graphs has the same strongly connected components as *G?*

(A) $G_1 = (V, E_1)$ where $E_1 = \{(u,v) \mid (u,v) \notin E\}$

(B) $G_2 = (V, E_2)$ where $E_2 = \{(u,v) \mid (v,u) \notin E\}$

(C) $G_3 = (V, E_3)$ where $E_3 = \{(u,v) \mid \text{there is a path of length} \le 2 \text{ from } u \text{ to } v \text{ in } E\}$

(D) $G_4 = (V_4, E)$ where V_4 is the set of vertices in G which are not isolated

Answer: (B)

Exp: Take an example for Graph G

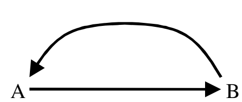
. .

A B

Then option A and D will be eliminated.

Let G is below graph

Then G_3 is a graph with below structure



In G the numbers of strongly connected components are 2 where as in G_3 it is only one.

4 Consider the following system of equations:

$$3x + 2y = 1$$
$$4x + 7z = 1$$
$$x + y + z = 3$$
$$x - 2y + 7z = 0$$

The number of solutions for this system is __________________

Answer: (1)

Exp: $3x+2y=1$

$4x+7z=1$

$x+y+z = 3$

$x-2y+7z=0$

Augmented matrix is $\begin{bmatrix} 3 & 2 & 0 & 1 \\ 4 & 0 & 7 & 1 \\ 1 & 1 & 1 & 3 \\ 1 & -2 & 7 & 0 \end{bmatrix}$

$R_1 \leftrightarrow R_3 \begin{bmatrix} 1 & 1 & 1 & 3 \\ 4 & 0 & 7 & 1 \\ 3 & 2 & 0 & 1 \\ 1 & -2 & 7 & 0 \end{bmatrix}$

$R_2 \to R_2 - 4R_1\ R_3 \to R_3 - 3R_1,\ R_4 \to R_4 - R_1$

$$\begin{bmatrix} 1 & 1 & 1 & 3 \\ 0 & -4 & 3 & -11 \\ 0 & -1 & -3 & -8 \\ 0 & -3 & 6 & -3 \end{bmatrix}$$

$\begin{matrix} R_3 \to 4R_3 - R_2 \\ \\ R_4 \to 4R_4 - 3R_2 \end{matrix} \begin{bmatrix} 1 & 1 & 1 & 3 \\ 0 & -4 & 3 & -11 \\ 0 & 0 & -15 & -21 \\ 0 & 0 & 15 & 21 \end{bmatrix}$

$R_4 \to R_4 + R_3 \begin{bmatrix} 1 & 1 & 1 & 3 \\ 0 & -4 & 3 & -11 \\ 0 & 0 & -15 & -21 \\ 0 & 0 & 0 & 0 \end{bmatrix}$

$\rho(A:B) = \rho(A) = 3 = \text{no. of variables}$

$\therefore$ Unique solution exists

5. The value of the dot product of the eigenvectors corresponding to any pair of different eigen values of a 4-by-4 symmetric positive definite matrix is ______________.

Answer: (0)

Exp: (The eigen vectors corresponding to distinct eigen values of real symmetric matrix are orthogonal)

6. Let the function

$$f(\theta)=\begin{vmatrix} \sin\theta & \cos\theta & \tan\theta \\ \sin\left(\pi/6\right) & \cos\left(\pi/6\right) & \tan\left(\pi/6\right) \\ \sin\left(\pi/3\right) & \cos\left(\pi/3\right) & \tan\left(\pi/3\right) \end{vmatrix}$$

Where $\theta=\in\left[\frac{\pi}{6},\frac{\pi}{2}\right]$ and $f'(\theta)$ denote the derivative of f with respect to θ. Which of the following statement is / are TRUE?

(I) There exists $\theta\in\left(\frac{\pi}{6},\frac{\pi}{3}\right)$ such that $f'(\theta)=0$.

(II) There exists $\theta\in\left(\frac{\pi}{6},\frac{\pi}{3}\right)$ such that $f'(\theta)\neq 0$.

(A) I only (B) II only (C) Both I and II (D) Neither I nor II

Answer: (C)

Exp: (By Mean value theorem)

7. Consider the following Boolean expression for *F*:

$F(P,Q,R,S)=PQ+\overline{P}QR+\overline{P}Q\overline{R}S$

The minimal sum-of products form of F is

(A) $PQ+QR+QS$ (B) $P+Q+R+S$

(C) $\overline{P}+\overline{Q}+\overline{R}+\overline{S}$ (D) $\overline{P}R+\overline{P}\overline{R}S+P$

Answer: (A)

Exp: $PQ+\overline{P}QR+\overline{P}Q\overline{R}S$

$=PQ+\overline{P}Q\left(R+\overline{R}S\right)$

$=PQ+\overline{P}Q\left(\left(R+\overline{R}\right)(R+S)\right)\left[\because A+BC=(A+B)(A+C)\right]$

$=PQ+\overline{P}Q(R+S)\left[\because R+\overline{R}=1\right]$

$=Q\left(P+\overline{P}(R+S)\right)$

$=Q\left(\left(P+\overline{P}\right)(P+R+S)\right)\left[\because A+BC=(A+B)(A+C)\right]$

$=Q(P+R+S) \quad \because\left[P+\overline{P}=1\right]$

$=PQ+QR+QS$

8. The base (or radix) of the number system such that the following equation holds is____________.

$$\frac{312}{20} = 13.1$$

Answer: (5)

Exp: Let ‘x’ be the base or radix of the number system

$$\frac{2\times x^{o} + 1\times x + 3\times x^{2}}{0\times x^{o} + 2\times x} = 3\times x^{o} + 1\times x + 1\times x^{-1}$$

$$\Rightarrow \frac{2 + x + 3x^{2}}{2x} = 3 + x + \frac{1}{x}$$

$$\Rightarrow \frac{3x^{2} + x + 2}{2x} = \frac{3x + x^{2} + 1}{x}$$

$$\Rightarrow 3x^{2} + x + 2 = 6x + 2x^{2} + 2$$

$$\Rightarrow x^{2} - 5x = 0$$

$$\Rightarrow x(x-5) = 0$$

$$\Rightarrow x = 0 \text{ or } x = 5$$

As base or radix of a number system cannot be zero, here $x = 5$

9. A machine has a 32-bit architecture, with 1-word long instructions. It has 64 registers, each of which is 32 bits long. It needs to support 45 instructions, which have an immediate operand in addition to two register operands. Assuming that the immediate operand is an unsigned integer, the maximum value of the immediate operand is ____________.

Answer: (16383)

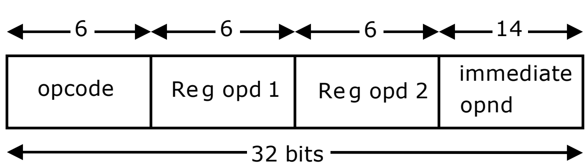
Exp: $1 \text{ Word} = 32 \text{ bits}$

Each instruction has 32 bits

To support 45 instructions, opcode must contain 6-bits

Register operand1 requires 6 bits, since the total registers are 64.

Register operand 2 also requires 6 bits



14-bits are left over for immediate Operand Using 14-bits, we can give maximum 16383, Since $2^{14} = 16384$ (from 0 to 16383)

10. Consider the following program in C language:

```
# include < stdio.h >
main( )
{
int  i;
int * pi = &i;
scanf ("%d", pi);
printf ("%d\n", i+5);
}
```

Which one of the following statements is **TRUE**?

(A) Compilation fails.

(B) Execution results in a run-time error.

(C) On execution, the value printed is **5** more than the address of variable **i**.

(D) On execution, the value printed is **5** more than the integer value entered.

Answer: (D)

Exp: pi contains the address of i. So scanf("%d",pi) places the value entered in console into variable i.e So printf("%d\n",i+5),prints 5 more than the value entered in console.

11. Let G be a graph with n vertices and m edges. What is the tightest upper bound on the running time of Depth First Search on G, when G is represented as an adjacency matrix?

(A) $\theta(n)$ (B) $\theta(n+m)$ (C) $\theta(n^2)$ (D) $\theta(m^2)$

Answer: (C)

Exp: DFS visits each vertex once and as it visits each vertex, we need to find all of its neighbours to figure out where to search next. Finding all its neighbours in an adjacency matrix requires O(V) time, so overall the running time will be $O(V^2)$.

12. Consider rooted n node binary tree represented using pointers. The best upper bound on the time required to determine the number of sub trees having exactly 4 nodes is $0(n^a \log^b n)$. Then the value of a + 10b is________

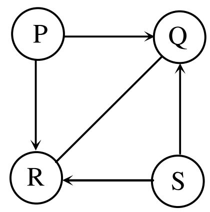
Answer: 1

Exp:
```
int print_subtrees_size_4(node  *n)
{
int size=0;
if(node==null)
return 0;
size=print_subtrees_size_4(node->left)+print_subtrees_size_4(node->right)+1;
 if(size==4)
printf("this is a subtree of size 4");
return size;
}
```

The above function on taking input the root of a binary tree prints all the subtrees of size 4 in O(n) time

so a=1 , b=0 and then a+10b=1

13. Consider the directed graph given below.



Which one of the following is **TRUE?**

(A) The graph does not have any topological ordering

(B) Both PQRS and SRQP are topological orderings

(C) Both PSRQ and SPRQ are topological orderings.

(D) PSRQ is the only topological ordering.

Answer: (C)

Exp: Topological ordering of a directed graph is a linear ordering of its vertices such that for every directed edge uv from vertex u to vertex v, u comes before v in the ordering. Topological ordering is possible iff graph has no directed cycles.

(A) As the given graph doesn't contain any directed cycles, it has at least one topological ordering. So option (A) is false

(B) PQRS cannot be topological ordering because S should come before R in the ordering as there is a directed edge from S to R.

SRQP cannot be topological ordering, because P should come before Q in the ordering as there is a directed edge from P to Q

(C) PSRQ and SPRQ are topological orderings as both of then satisfy the above mentioned topological ordering conditions.

(D) PSRQ is not the only one topological ordering as SPRQ is other possibility

14. Let P be a quick sort program to sort numbers in ascending order using the first element as the pivot. Let t_1 and t_2 and t_2 be the number of comparisons made by P for the inputs [1 2 3 4 5] and [4 1 5 3 2] respectively. Which one of the following holds?

(A) $t_1 = 5$ (B) $t_1 < t_2$ (C) $t_1 > t_2$ (D) $t_1 = t_2$

Answer: (C)

Exp: Partition algorithm for quick sort

$\text{Partition}(A, P, q) // A[P, \ldots\ldots q]$

$x \leftarrow A[P] // \text{pivot} = A[P]$

$i \leftarrow P$

$\text{for } j = P + 1 \text{ to } q$

$\quad \text{do if } A[j] \leq x$

$\qquad \text{then } i \leftarrow i + 1$

$\qquad \text{exchange } A[i] \leftrightarrow A[j]$

$\text{exchange} A[P] \leftrightarrow A[i]$

return i [returning where pivot element is there after partitioning]

Recursively call the above algorithm for the two sub arrays [elements before and after pivot element] to complete the sorting.

$x = \text{pivot}$

1 2 3 4 5
i j

1 2 3 4 5

Pivot

$\therefore$ 6 comparisons

15. Which one of the following is **TRUE**?

(A) The language $L = \{a^n b^n \mid n \ge 0\}$ is regular.

(B) The language $L = \{a^n \mid n \text{ is prime}\}$ is regular.

(C) The language $L = \{ w \mid w$ has $3k+1$ b's for some $k \in N$ with $\Sigma = \{a,b\}\}$ is regular.

(D) The language $L = \{ww \mid w \in \Sigma^*$ with $\Sigma = \{0,1\}\}$ is regular.

Answer: (C)

Exp: (A) $L = \{a^n b^n \mid n \ge 0\}$ is a CFL but not regular, it requires memory for the representation

(B) $L = \{a^n \mid n \text{ is prime}\}$ is neither regular nor CFL

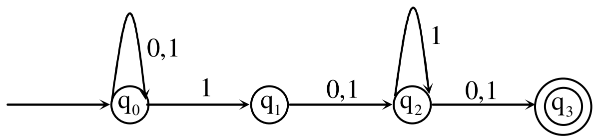
(C) $L = \{w \mid w \text{ has } 3K+1 \text{ b's for some } k \in N \text{ with}\}$

$\Sigma = \{a,b\}$

is a regular language, since the total count of b's are multiple of 3 plus one. The regular expression is $a^*ba^*(a^*ba^*ba^*ba^*)^* + (a^*ba^*ba^*ba^*)^*a^*ba^*$

(D) $L = \{ww \mid w \in \Sigma^* \text{ with } \Sigma = \{0,1\}\}$ is neither regular nor CFL

16. Consider the finite automaton in the following figure.



What is the set of reachable states for the input string 0011?

(A) $\{q_0, q_1, q_2\}$ (B) $\{q_0, q_1\}$ (C) $\{q_0, q_1, q_2, q_3\}$ (D) $\{q_3\}$

Answer: (A)

Exp:
$$\begin{aligned}\delta(q_0, 0011) &= \delta(q_0, 011)\\ &= \delta(q_0, 11)\\ &= \delta(\{q_0, q_1\}, 1)\\ &= \delta(q_0, 1) \cup \delta(q_1, 1)\\ &= \{q_0, q_1\} \cup \{q_2\}\\ &= \{q_0, q_1, q_2\}\end{aligned}$$

17. Which one of the following is **FALSE**?

(A) A basic block is a sequence of instructions where control enters the sequence at the beginning and exits at the end.

(B) Available expression analysis can be used for common subexpression elimination.

(C) Live variable analysis can be used for dead code elimination

(D) $x = 4 * 5 \Rightarrow x = 20$ is an example of common subexpression elimination

Answer: (D)

Exp: $x = 4 \times 5 \Rightarrow x = 20$ is not an example of common sub-expression but it is constant folding. In constant folding expression consisting of constants will be replaced by their final value at compile time, rather than doing the calculation in run-time.

18. Match the following

(1) Waterfall model	(a) Specifications can be developed
(2) Evolutionary model	(b) Requirements compromises are inevitable
(3) Component based software	(c) Explicit recognition of risk
(4) Spiral development	(d) Inflexible partitioning of the project into stages

(A) 1-a, 2-b, 3-c, 4-d (B) 1-d, 2-a, 3-b, 4-c

(C) 1-d, 2-b, 3-a, 4-c (D) 1-c, 2-a, 3-b, 4-d

Answer: (B)

Exp: The main drawback of the waterfall model is the difficulty of accommodating change after the process is underway. One phase has to be complete before moving onto the next phase. Inflexible partitioning of the project into distinct stages in waterfall model makes it difficult to respond to changing customer requirements.

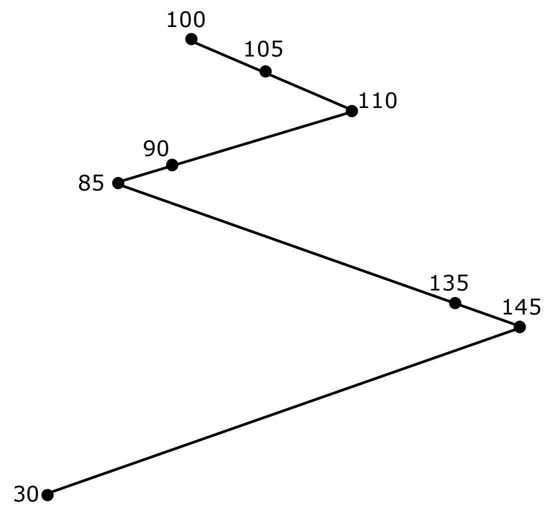
Evolutionary software models are iterative. They are characterized in manner that enables the software engineers to develop increasingly more complete version of software.

In Spiral model, Development can be divided in to smaller parts and more risky parts can be developed earlier which helps better risk management.

19. Suppose a disk has 201 cylinders, numbered from 0 to 200. At some time the disk arm is at cylinder 100, and there is a queue of disk access requests for cylinders 30, 85, 90, 100, 105, 110, 135 and 145. If Shortest-Seek Time First (SSTF) is being used for scheduling the disk access, the request for cylinder 90 is serviced after servicing ____________ number of requests.

Answer: (3)

Exp:



Request for cylinder is served after serving 3 requests (100,105 and 110)

20. Which one of the following is **FALSE**?

(A) User level threads are not scheduled by the kernel.

(B) When a user level thread is blocked, all other threads of its process are blocked.

(C) Context switching between user level threads is faster than context switching between kernel level threads.

(D) Kernel level threads cannot share the code segment.

Answer: (D)

Exp: User threads are supported above the kernel and a managed without kernel support. The thread function library to implement user level threads usually runs on top of the system in user mode. Thus these threads with in a process are invisible to the operating system. Since the kernel is unaware of the existence of such threads; when one user level thread is blocked in the kernel all other threads of its process are blocked. So options (A) and (B) are true

(C) The OS is aware of kernel level threads. Kernel threads are scheduled by the OS's scheduling algorithms and require a "lightweight" context switch to switch between (that is, registers, PC and SP must be changed, but the memory context remains the same among kernel threads in the (same process). User level threads are much faster to switch between as there is not context switch

(D) False

Kernel level threads within the same process share code section, data section and other operating system resources such as open files and signals.

21. Consider the relation scheme R = (E, F, G, H, I, J, K, L, M, N) and the set of functional dependencies $\{\{E,F\} \to \{G\}, \{F\} \to \{I,J\}, \{E,H\} \to \{K,L\} \to (M)$, $\{K\} \to \{M\}, \}$ $\{L\} \to \{N\}$ on R. What is the key for R?

(A) {E, F} (B) {E, F, H} (C) {E, F, H, K, L} (D) {E}

Answer: (B)

Exp: $R(EFGHI, JKLMN)$

$F = \{$

$EF \to G$

$F \to IJ$

$EH \to KL$

$K \to M$

$L \to N$

$\}$

$(EF)^+ = EFGIJ$, $E \,\&\, F$ Together functionally derive GIJ and if we observe given FDs, H can't be determined by any other attributes. So H must be part of all the (candidate) keys. H along with E determines K and L, K & L functionally determine M and N respectively.

$\therefore (EFH)^+ = EFGIJHKLMN$

$\therefore$ EFH is the only candidate for key.

22. Given the following statements:

S1: A foreign key declaration can always be replaced by an equivalent check assertion in SQL

S2: Given the table R(a,b,c) where a and b together form the primary key, the following is a valid table definition.

CREATE TABLE S (

a INTEGER,

d INTEGER,

e INTEGER,

PRIMARY KEY (d),

FOREIGN KEY (a) references R)

Which one of the following statements is **CORRECT**?

(A) S1 is TRUE and S2 is a FALSE (B) Both S1 and S2 are TRUE

(C) S1 is FALSE and S2 is a TRUE (D) Both S1 and S2 are FALSE

Answer: (D)

Exp: S_1: Manager (Name, DeptID)

Department (DeptName, Deptid)

In given relation Manager DeptID is a foreign key referencing Deptid (P.K) of relation Department.

Let's declare the foreign key by an equivalent check assertion as follows:-

```
CREATE TABLE Manager (
    Name  Varchar (10)
    DeptID  INT (6)  check (DeptID IN (  select Deptid  from Department)),
    PRIMARY KEY (Name)
    );
```

The above use of check assertion is good to declare the foreign key as far as insertion is considered for relation manager (will not insert any tuple in Manager containing such DeptID value which is not present in any tuple of Department).

But the above declaration will fail to implement changes done in Department relation in terms of deletion & updation. For an instance if a deptid present in Department gets deleted, then respective reference in Manager should also be deleted.

$\therefore S_1$ is false.

S_2: The given table definition is not valid due to invalid foreign key declaration. Attribute a is declared as foreign key which is a single valued attribute and it is referencing the primary key (ab) of relation R (a, b, c), which is a composite key.

A single value attribute cannot refer a composite key.

4 S_2 is false.

23. Consider the following three statements about link state and distance vector routing protocols, for a large network with 500 network nodes and 4000 links

[S1] The computational overhead in link state protocols is higher than in distance vector protocols.

[S2] A distance vector protocol (with split horizon) avoids persistent routing loops, but not a link state protocol.

[S3] After a topology change, a link state protocol will converge faster than a distance vector protocol.

Which one of the following is correct about S1, S2, and S3?

(A) S1, S2, and S3 are all true

(B) S1, S2, and S3 are all false.

(C) S1 and S2 are true, but S3 is false

(D) S1 and S3 are true, but S2 is false.

Answer: (D)

Exp: Statement S1

The Distance Vector routing protocols rely on the information from their directly connected neighbours in order to calculate and accumulate route information. Distance Vector routing protocols require very little overhead as compared to Link State routing protocols as measured by memory and processor power while the Link State routing protocols do not rely solely on the information from the neighbours or adjacent router in order to calculate route information. Instead, Link State routing protocols have a system of databases that they use in order to calculate the best route to destinations in the network. This is TRUE

Statement S3

Distance Vector exchanges the routing updates periodically whether the topology is change or not, this will maximize the convergence time which increases the chance of routing loops while the Link State routing protocols send triggered change based updates when there is a topology change. After initial flood, pass small event based triggered link state updates to all other routers. This will minimize the convergence time that's why there is no chance of routing loops. This is TRUE**.**

24. Which one of the following are used to generate a message digest by the network security protocols?

(P) RSA (Q) SHA-1 (R) DES (S) MD5

(A) P and R only (B) Q and R only (C) Q and S only (D) R and S only

Answer: (C)

Exp: RSA and DES are for Encryption where MD5 and SHA – 1 are used to generate Message Digest.

25. Identify the correct order in which the following actions take place in an interaction between a web browser and a web server.

1. The web browser requests a webpage using HTTP.
2. The web browser establishes a TCP connection with the web server.
3. The web server sends the requested webpage using HTTP.
4. The web browser resolves the domain name using DNS.

(A) 4,2,1,3 (B) 1,2,3,4 (C) 4,1,2,3 (D) 2,4,1,3

Answer: (A)

Exp: First of all the browser must now know what IP to connect to. For this purpose browser takes help of Domain name system (DNS) servers which are used for resolving hostnames to IP addresses. As browser is an HTTP client and as HTTP is based on the TCP/IP protocols, first it establishes a TCP connection with the web server and requests a webpage using HTTP, and then the web server sends the requested webpage using HTTP. Hence the order is 4,2,1,3

Q.No. 26 – 55 Carry Two Marks

26. Consider a token ring network with a length of 2km having 10 stations including a monitoring station. The propagation speed of the signal is 2×10^8 m/s and the token transmission time is ignored. If each station is allowed to hold the token for 2 μsec, the minimum time for which the monitoring station should wait (**in μsec**) before assuming that the token is lost is _______.

Answer: (28μs to 30μs)

Exp: Given Length (d) = 2 Km

No. of Stations (m) = 10

Propagation Speed (v) = 2×10^8 m/s

THT = 2μs

So, Max. TRT = T_P in the Ring + No. of Active Stations * THT

$$= 10 \times 10^{-6} + 10 \times 2 \times 10^{-6}$$

$$= 30\ \mu s$$

27. Let the size of congestion window of a TCP connection be 32 KB when a timeout occurs. The round trip time of the connection is 100 msec and the maximum segment size used is 2kB. The time taken (in msec) by the TCP connection to get back to 32KB congestion window is ______

Answer: (1100 to 1300)

Exp: Given that at the time of Time Out, Congestion Window Size is 32KB and RTT = 100ms

When Time Out occurs, for the next round of Slow Start, Threshold = (size of Cwnd) / 2

It means Threshold = 16KB

Slow Start

2KB

1RTT

4KB

2RTT

8KB

3RTT

16KB ----------- Threshold reaches. So Additive Increase Starts

4RTT

18KB

5RTT

20KB

6RTT

22KB

7RTT

24KB

8RTT

26KB

9RTT

28KB

10RTT

30KB

11RTT

32KB

So, Total no. of RTTs = 11 → 11 * 100 = 1100

28. Consider a selective repeat sliding window protocol that uses a frame size of 1 KB to send data on a 1.5 Mbps link with a one-way latency of 50 msec. To achieve a link utilization of 60%, the minimum number of bits required to represent the sequence number field is ________.

Answer: (5)

Exp: Given $L = 1KB$

$B = 1.5Mbps$

$T_p = 50ms$

$\eta = 60\%$

Efficiency formula for SR protocol is

$$\eta = \frac{W}{1+2a} \Rightarrow \frac{60}{100} = \frac{W}{1+2a}\left(\because a = \frac{T_p}{T_x}\right)$$

$$T_x = \frac{L}{B} = \frac{8\times10^3}{1.5\times10^6} = 5.3ms$$

$$a = \frac{T_p}{T_x} = \frac{50}{5.3} = \frac{500}{53} = 9.43$$

$$\Rightarrow \frac{60}{100} = \frac{W}{19.86} \Rightarrow W = 11.9 \approx 12$$

$$\Rightarrow W = 2^{n-1} = 12 \Rightarrow 2^n = 24 \Rightarrow 2^n = 24 \approx 2^5 \Rightarrow \boxed{n = 5}$$

29. Consider the following four schedules due to three transactions (indicted by the subscript) using read and write on a data item x, denoted r (x) and w (x) respectively. Which one of them is conflict serializable?

(A) $r_1(x)\,;\,r_2(x)\,;\,w_1(x)\,;\,r_3(x)\,;\,w_2(x)$

(B) $r_2(x)\,;\,r_1(x)\,;\,w_2(x)\,;\,r_3(x)\,;\,w_1(x)$

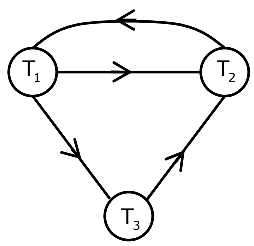
(C) $r_3(x)\,;\,r_2(x)\,;\,r_1(x)\,;\,w_2(x)\,;\,w_1(x)$

(D) $r_2(x)\,;\,w_2(x)\,;\,r_3(x)\,;\,r_1(x)\,;\,w_1(x)$

Answer: (D)

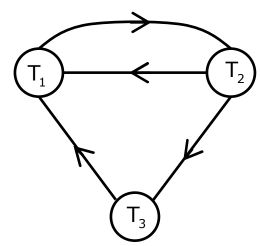
Exp: If there is a cycle in precedence graph, then the schedule is not conflict serializable.

(A)



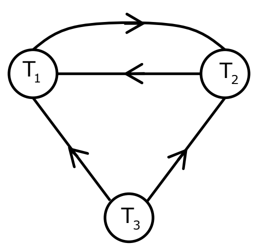
Not conflict serializable

(B)



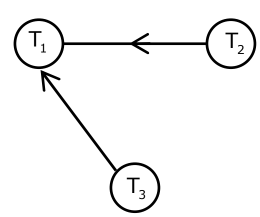
not conflict serializable

(C)



Not conflict serializable

(D)



it is conflict equivalent to

$T_2 \rightarrow T_3 \rightarrow T_1$ &

$T_3 \rightarrow T_2 \rightarrow T_1$

30. Given the following two statements:

S1: Every table with two single-valued attributes is in 1NF, 2NF, 3NF and BCNF

S2 : $AB \to C,\ D \to E,\ E \to C$ is a minimal cover for the set of functional dependencies $AB \to C,\ D \to E,\ AB \to E, E \to C$

Which one of the following is **CORRECT?**

(A) S1 is TRUE and S2 is FALSE.
(B) Both S1 and S2 are TRUE.
(C) S1 is FALSE and S2 is TRUE.
(D) Both S1 and S2 are FALSE.

Answer: (A)

Exp: S_1 : True

Consider any table R with two attributes $R(A.B)$

The possible FD sets are

$F_1 = \{$
$A \to B$
$\}$
Key : A and is in BCNF

$F_2 = \{$
$B \to A$
$\}$
Key : B and is in BCNF

$F_3 = \{$
$A \to B$
$B \to A$
$\}$
Key : A & B It is in BCNF

$F_4 = \{$
$\}$
Key : AB and is in BCNF

If a table is in BCNF it is also in 1NF, 2NF and 3NF also

S_2 : False

First FD set cannot cover second FD set because in second FD set AB can functionally derive E but that is not happing in first FD set.

31. An operating system uses the *Banker's algorithm* for deadlock avoidance when managing the allocation of three resource types X, Y, and Z to three processes P0, P1, and P2. The table given below presents the current system state. Here, the *Allocation* matrix shows the current number of resources of each type allocated to each process and the *Max* matrix shows the maximum number of resources of each type required by each process during its execution.

	Allocation			Max		
	X	Y	Z	X	Y	Z
P0	0	0	1	8	4	3
P1	3	2	0	6	2	0
P2	2	1	1	3	3	3

There are 3 units of type X, 2 units of type Y and 2 units of type Z still available. The system is currently in a **safe** state. Consider the following independent requests for additional resources in the current state:

REQ1: P0 requests 0 units of X, 0 units of Y and 2 units of Z

REQ2: P1 requests 2 units of X, 0 units of Y and 0 units of Z

Which one of the following is **TRUE**?

(A) Only REQ1 can be permitted.

(B) Only REQ2 can be permitted.

(C) Both REQ1 and REQ2 can be permitted.

(D) Neither REQ1 nor REQ2 can be permitted.

Answer: (B)

Exp: REQ1

Once P_0 is allocated with $(0,0,2)$, the status of the system will be as follows

Allocation	Max	Need	Available
X Y Z	X Y Z	X Y Z	X Y Z
0 0 3	8 4 3	8 4 0	3 2 0
3 2 0	6 2 0	3 0 0	
2 1 1	3 3 3	1 2 2	

With available $(3,2,0)$ only P_1 can be served. Once P_1 is executed, available will be $(6,4,0)$, with $(6,4,0)$ we can't serve either P_0 or P_2. Hence there is no safe sequence. Hence REQ1 can't be permitted.

REQ2

Once P_1 is allocated with $(2,0,0)$, the status of the system will be as follows

	Allocated	Max	Need	Available
	X Y Z	X Y Z	X Y Z	X Y Z
P_0	0 0 1	8 4 3	8 4 2	1 2 2
P_1	5 2 0	6 2 0	1 0 0	
P_2	2 1 1	3 3 3	1 2 2	

With available $(1,2,2)$, we can serve either P_1 or P_2.

If we serve P_1 then the safe sequence is $\langle P_1, P_2, P_0 \rangle$. If we serve P_2 then the safe sequence is $\langle P_2, P_1, P_0 \rangle$. As true is at least one safe sequence we can permit REQ2.

32. Consider the following set of processes that need to be scheduled on a single CPU. All the times are given in milliseconds

Process Name	**Arrival Time**	**Execution Time**
A	0	6
B	3	2
C	5	4
D	7	6
E	10	3

Using the *shortest remaining time first* scheduling algorithm, the average process turnaround time (in msec) is ______________________.

Answer: (7.2)

Exp:

A	B	A	C	E	D

0 3 5 8 12 15 21

$$\text{Average turn around time} = \frac{(8-0)+(5-3)+(12-5)+(21-7)+(15-10)}{5}$$

$$= \frac{36}{5} \Rightarrow 7.2\,\text{ms}$$

33. Assume that there are 3 page frames which are initially empty. If the page reference string 1, 2, 3, 4, 2, 1, 5, 3, 2, 4, 6, the number of page faults using the optimal replacement policy is __________

Answer: (7)

Exp:

1	2	3	4	2	1	5	3	2	4	
		3	4	4	4	4	4	4	4	4
	2	2	2	2	2	2	2	2	2	6
1	1	1	1	1	1	5	3	3	3	3
F	F	F	F	H	H	F	F	H	H	F

7 page faults

34. A canonical set of items is given below

$$s \to L. > R$$
$$Q \to R.$$

On input symbol $<$ the set has

(A) a shift-reduce conflict and a reduce-reduce conflict.

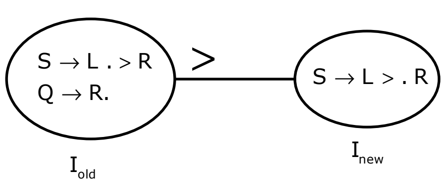
(B) a shift-reduce conflict but not a reduce-reduce conflict.

(C) a reduce-reduce conflict but not a shift-reduce conflict.

(D) neither a shift-reduce nor a reduce-reduce conflict.

Answer: (D)

Exp:



From above diagram, we can see that there is no shift- reduce or reduce-reduce conflict.

35. Let L be a language and $\overline{L}$ be its complement. Which of the following is NOT a viable possibility?

(A) Neither L nor $\overline{L}$ is recursively enumerable (r.e.).

(B) One of L and $\overline{L}$ is r.e. but not recursive; the other is not r.e.

(C) Both L and $\overline{L}$ are r.e. but not recursive.

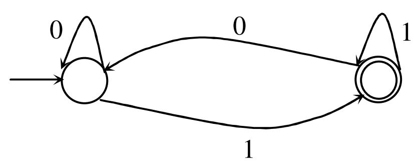
(D) Both L and $\overline{L}$ are recursive.

Answer: (C)

Exp: Recursive languages are closed under complement.

If a language L is recursive enumerable but not recursive then its complement is not a recursive enumerable, so both L and $\overline{L}$ are recursive enumerable but not recursive is not a viable possibility.

36. Which of the regular expressions given below represent the following DFA?



I) 0*1(1+00*1)*

II) 0*1*1+11*0*1

III) (0+1)*1

(A) I and II only
(B) I and III only
(C) II and III only
(D) I, II, and III

Answer: (B)

Exp: Given DFA will accept all the strings over $\varepsilon = \{0,1\}$ which are ending with 1.

$0^*1(1+00^*1)^*$ and $(0+1)^*1$, are the regular expressions for ending with 1.

37. There are 5 bags labelled 1 to 5. All the coins in a given bag have the same weight. Some bags have coins of weight 10 gm, others have coins of weight 11 gm. I pick 1, 2, 4, 8, 16 coins respectively from bags 1 to 5. Their total weight comes out to 323 gm. Then the product of the labels of the bags having 11 gm coins is ___.

Answer: 12

Exp: Let the weight of coins in the respective bags (1 through 5) be a,b,c,d and e-each of which can take one of two values namely 10 or 11 (gm).

Now, the given information on total weight can be expressed as the following equation:

1.a+2.b+4.c+8.d+16.e = 323

$\Rightarrow$ a must be odd $\Rightarrow$ a = 11

The equation then becomes:

11+2.b+4.c+8.d+16.e = 323

$\Rightarrow$ 2.b+4.c+8.d+16.e = 312

$\Rightarrow$ b+2.c+4.d+8.e = 156

$\Rightarrow$ b must be even $\Rightarrow$ b = 10

The equation then becomes:

10+2.c+4.d+8.e = 156

$\Rightarrow$ 2.c+4.d+8.e = 146

$\Rightarrow$ c+2.d+4.e = 73

$\Rightarrow$ c must be odd $\Rightarrow$ c = 11

The equation now becomes:

11+2.d+4.e = 73

$\Rightarrow$ 2.d+4.e = 62

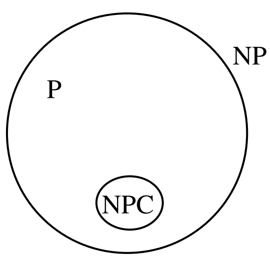
$\Rightarrow$ d+2.e = 31

$\Rightarrow$ e = 11 and e = 10

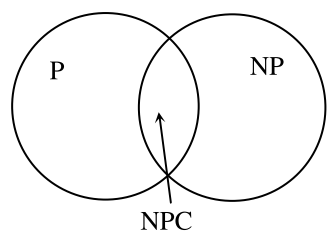
Therefore, bags labelled 1, 3 and 4 contain 11 gm coins $\Rightarrow$ Required Product = 1*3*4* = 12.

38. Suppose a polynomial time algorithm is discovered that correctly computes the largest clique in a given graph. In this scenario, which one of the following represents the correct Venn diagram of the complexity classes P, NP and NP Complete (NPC)?

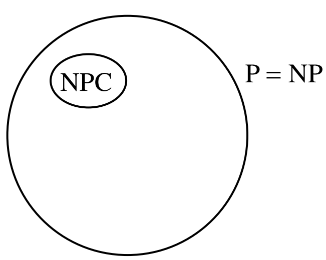
(A)



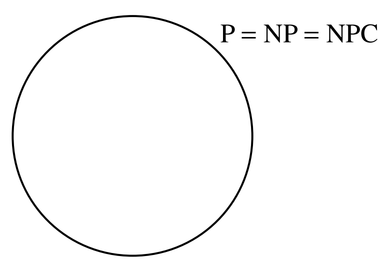
(B)



(B)



(D)



Answer: (D)

Exp: The most important open question in complexity theory is whether the **P = NP** , which asks whether polynomial time algorithms actually exist for **NP**-complete and all **NP** problems (since a problem "C" is in NP-complete, iff C is in NP and every problem in NP is reducible to C in polynomial time). In the given question it is given that some polynomial time algorithm exists which computes the largest clique problem in the given graph which is known NP-complete problem. Hence P=NP=NP-Complete.

39. The minimum number of comparisons required to find the minimum and the maximum of 100 numbers is _________________.

Answer: (148)

Exp: From the list of given n numbers [say n is even],

Pick up first two elements, compare them

assign $\text{Current}-\min = \min \text{ of two numbers}$

$\text{Current}-\max = \max \text{ of two numbers}$

From the remaining $n-2$ numbers, take pairs wise and follow this process given below.

1. Compare two elements

   Assign min = min of two numbers

   max = max of two numbers

2. Compare min and current - min

   Assign $\text{current}-\min = \min\{\text{current}-\min, \min\}$

3. Compare max and current - max

   Assign $\text{current}-\max = \max\{\text{current}-\max, \max\}$

Repeat above procedure for all the remaining pairs of numbers. We can observe that each of pair requires 3 comparisons

1. for finding min and max
2. For updating current – min
3. for updating current – max

But for initial pair we need only one comparison not 3.

$$\therefore \text{total number of comparisons} = \frac{3(n-2)}{2} + 1 = \frac{3n}{2} - 3 + 1 = \frac{3n}{2} - 2$$

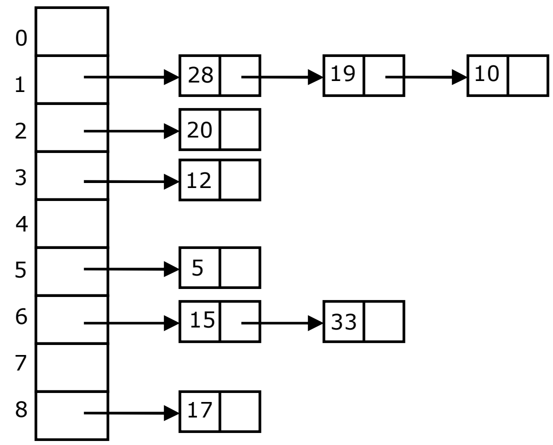
Here $n = 100,$ so number of comparisons = 148.

40. Consider a hash table with 9 slots. The hash function is $h(k) = k \bmod 9.$ The collisions are resolved by chaining. The following 9 keys are inserted in the order: 5, 28, 19, 15, 20, 33, 12, 17, 10. The maximum, minimum, and average chain lengths in the hash table, respectively, are

(A) 3, 0, and 1 (B) 3, 3, and 3 (C) 4, 0, and 1 (D) 3, 0, and 2

Answer: (A)

Exp:



$\therefore$ Maximum & minimum chain lengths are 3 & 0 respectively

$$\text{Average chain length} = \frac{0+3+1+1+0+1+2+0+1}{9} = 1$$

41. Consider the following C function in which **size** is the number of elements in the array **E**:

```
int MyX(int *E, unsigned int size)
{
 int Y = 0;
 int Z;
 int i, j, k;

for(i = 0; i < size; i++)
   Y = Y + E[i];
for(i = 0; i < size; i++)
  for(j = i; j < size; j++)
  {
Z = 0;
for(k = i; k <= j; k++)
Z = Z + E[k];
if (Z > Y)
  Y = Z;
}
  return Y;
}
```

The value returned by the function **MyX** is the

(A) maximum possible sum of elements in any sub-array of array **E**.

(B) maximum element in any sub-array of array **E**.

(C) sum of the maximum elements in all possible sub-arrays of array **E**.

(D) the sum of all the elements in the array **E**.

Answer: (A)

Exp: int Myx (int * E, unsinged int sixe)

```
{
 int Y = 0;
int z;
int i, j, k;
for (i = 0; i < size; i++)     } Calculates sum of the elements
    Y = Y + E[i]               } of the array E and stores it in Y
for (i = 0; i < size; i++)             }
  for (j = i; j < size; j++)           }
   {                                   } calculates the sum of elements of
      z = 0;                           }      all posible subarrays of E
      for (k = i; k <= j; k++)         }
          z = z + E[k];                }
      if (z > Y) → Checks whether sum of elements of each subarray
          Y = z;   is greaer than the sum of elements of array if so, that sum
       }            is assigned to Y, if not 'Y' will be the sum of elements of
return Y;           complete array
}
```

Ultimately returns the maximum possible sum of elements in any sub array of given array E.

42. Consider the following pseudo code. What is the total number of multiplications to be performed?

D= 2

for i = 1 to n do

for j = i to n do

 for k = j + 1 to n do

 D = D * 3

(A) Half of the product of the 3 consecutive integers

(B) One-third of the product of the 3 consecutive integers.

(C) One-sixth of the product of the 3 consecutive integers.

(D) None of the above.

Answer: (C)

Exp: $i=1,\ j=1,\ k=2 \text{ to } n \Rightarrow n-1 \text{ times}$

$$\left.\begin{array}{l} i=1,\ j=2,\ k=3 \text{ to } n \Rightarrow n-2 \text{ times} \\ i=1,\ j=3,\ k=4 \text{ to } n \Rightarrow n-3 \text{ times} \\ \ \vdots \\ i=1,\ j=n-2,\ k=n-1 \text{ to } n \Rightarrow 2 \text{ times} \end{array}\right\} \sum(n-1) \text{ times}$$

$i=1,\ j=n-1,\ k=n \text{ to } n \Rightarrow 1 \text{ time}$

$$\left.\begin{array}{l} i=2, j=2, k=3 \text{ to } n \Rightarrow n-2 \text{ times} \\ i=2, j=3, k=4 \text{ to } n \Rightarrow n-3 \text{ times} \\ \ \vdots \quad \vdots \\ \ \vdots \quad \vdots \\ i=2, j=n-1, k=n \text{ to } n \Rightarrow 1 \text{ time} \end{array}\right\} \sum(n-2) \text{ times}$$

$\vdots$

$\vdots$

$i=n-1, j=n-1, k=n \text{ to } n \Rightarrow 1 \text{ time } \} \sum 1 \text{ times}$

$\therefore$ Total number of multiplications

$$\Rightarrow \sum 1 + \sum 2 + \sum 3 + \ldots\ldots \sum(n-1)$$

$$= \underset{S_1}{\underset{\downarrow}{1}} + \underset{S_2}{\underset{\downarrow}{(1+2)}} + \underset{S_3}{\underset{\downarrow}{(1+2+3)}} + \ldots + \underset{S_{n-1}}{\underset{\downarrow}{(1+2+3+..n-1)}}$$

$$= \sum_{i=1}^{n-1} S_i = \sum \frac{n(n-1)}{2}$$

$$= \frac{1}{2}\sum n^2 - \frac{1}{2}\sum n$$

$$= \frac{1}{2}\frac{n(n+1)(2n+1)}{6} - \frac{1}{2}\frac{n(n+1)}{2} = \frac{(n-1)(n)(n+1)}{6}$$

43. Consider a 6-stage instruction pipeline, where all stages are perfectly balanced. Assume that there is no cycle-time overhead of pipelining. When an application is executing on this 6-stage pipeline, the speedup achieved with respect to non-pipelined execution if 25% of the instructions incur 2 pipeline stall cycles is ______________________.

Answer: (4)

Exp: For 6 stages, non- pipelining takes 6 cycles.

There were 2 stall cycles for pipelining for 25% of the instructions

$$\text{So pipe line time} = \left(1 + \frac{25}{100}2\right)$$

$$= \frac{3}{2} = 1.5$$

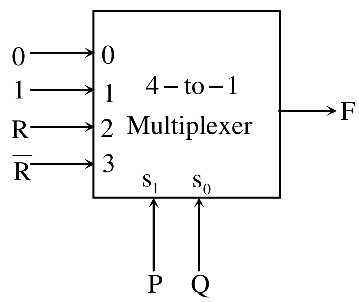
$$\text{Speed up} = \frac{\text{Non} - \text{pipeline time}}{\text{Pipeline time}} = \frac{6}{1.5} = 4$$

44. An access sequence of cache block addresses is of length N and contains n unique block addresses. The number of unique block addresses between two consecutive accesses to the same block address is bounded above K. What is the miss ratio if the access sequence is passed through a cache of associativity $A \geq k$ exercising least-recently-used replacement policy?

(A) n/N (B) l/N (C) 1/A (D) k/n

Answer: (A)

45. Consider the 4-to-1 multiplexer with two lines S_1 and S_0 given below.



The minimal sum of-products form of the Boolean expression for the output F of the multiplexer is

(A) $\bar{P}Q + Q\bar{R} + P\bar{Q}R$ (B) $\bar{P}Q + \bar{P}Q\bar{R} + PQ\bar{R} + P\bar{Q}R$

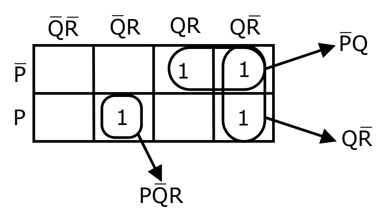
(C) $\bar{P}QR + \bar{P}Q\bar{R} + Q\bar{R} + P\bar{Q}R$ (D) $PQ\bar{R}$

Answer: (A)

Exp: $\bar{P}\bar{Q}.O + \bar{P}Q.1 + P\bar{Q}.R + PQ\bar{R}$

$= \bar{P}Q + P\bar{Q}.R + PQ\bar{R}$

Hence the minimized expression is $\bar{P}Q + Q\bar{R} + P\bar{Q}R$



46. The function f(x) = x sin x satisfies the following equation. f"(x) + f(x) +tcosx = 0. The value of t is______.

Answer: -2

Exp: Given $f''(x) + f(x) + t\cos x = 0$

and $f(x) = x\sin x$

$f'(x) = x\cos x + \sin x$

$f''(x) = x(-\sin x) + \cos x + \cos x$

$= 2\cos x - x\sin x$

$= 2\cos x - f(x)$

$\therefore 2\cos x - f(x) + f(x) + t\cos x = 0$

$\Rightarrow 2\cos x = -t\cos x \Rightarrow t = -2$

47. A function f(x) is continuous the interval [0,2]. It is known that f(0) = f(2) = -1 and f(1) = 1. Which one of the following statements must be true?

(A) There exists a y in the interval (0,1) such that f(y) = f(y + 1)
(B) For every y in the interval (0,1), f(y) = f(2 - y)
(C) The maximum value of the function in the interval (0.2) is 1
(D) There exists a y in the interval (0,1) such that f(y) =f(2 – y)

Answer: (A)

Exp: Define g(x) =f(x)-f(x+1) in [0,1]. g(0) is negative and g(1) is positive. By intermediate value theorem there is y€(0,1) such that g(y)=0

That is f(y) =f(y+1).

Thus answer is (a)

48. For fair six-sided dice are rolled. The probability that the sum of the results being 22is $X/1296$. The value of X is _________

Answer: (10)

Exp: 22 occurred in following ways

6 6 6 4 $\rightarrow$ 4ways

6 6 5 5 $\rightarrow$ 6ways

Required probability = $\dfrac{6+4}{2296} = \dfrac{10}{2296} \Rightarrow x = 10$

49. A pennant is a sequence of numbers, each number being 1 or 2. An n-pennant is a sequence of numbers with sum equal to n. For example, (1,1,2) is a 4-pennant. The set of all possible 1-pennants is {(1)}, the set of all possible 2-pennants is {(2), (1,1)}and the set of all 3-pennants is {(2,1), (1,1,1), (1,2)}. Note that the pennant (1,2) is not the same as the pennant (2,1). The number of 10- pennants is ______________.

Answer: (89)

Exp: No twos: 1111111111$\Rightarrow$1 pennant

Single two: 211111111$\Rightarrow$9!/8!1! = 9 pennants

Two twos: 22111111$\Rightarrow$8!/6!.2! = 28

Three twos: 2221111$\Rightarrow$7!/3!.4! = 35

Four twos: 222211$\Rightarrow$6!/4!.2! = 15

Five twos: 22222$\Rightarrow$1

Total = 89 pennants.

50. Let S denote the set of all functions $f : \{0,1\}^4 \rightarrow \{0,1\}$. Denote by N the number of functions from S to the set {0,1}. The value of $\log_2 \log_2 N$ is______.

Answer: (16)

Exp: The number of functions from A to B where size of A = |A| and size of B = |B| is $|B|^{|A|}$

$\{0,1\}^4 = \{0,1\}X\{0,1\}X\{0,1\}X\{0,1\} = 16$

$|S| = 2^{16}$

$N = 2^{|S|}$

$\log\log N = \log\log 2^{|S|} = \log|S| = \log 2^{16} = 16$

51. Consider an undirected graph G where self-loops are not allowed. The vertex set of G is {i, f): 1≤ i ≤ 12, 1 ≤ j ≤ 12}. There is an edge between (a,b) and (c,d) if $|a-c|\leq 1$ and $|b-d|\leq 1$ The number of edges in the graph is _____________.

Answer: (506)

Exp: The graph formed by the description contains 4 vertices of degree 3 and 40verices of degree 5 and 100 vertices of degree 8.

According to sum of the degrees theorem 4*3+40*5+100*8 = 2|E|

|E| = 1012/2 = 506

52. An ordered n-tuple (d_1,d_2,…,d_n) with $d_1 \geq d_2 \geq .... \geq d_n$ is called graphic if there exists a simple undirected graph with n vertices having degrees $d_1, d_2, ..., d_n$ respectively. Which of the following 6-tuples is NOT graphic?

(A) (1, 1, 1, 1, 1, 1)
(B) (2, 2, 2, 2, 2, 2)
(C) (3, 3, 3, 1, 0, 0)
(D) (3, 2, 1, 1, 1, 0)

Answer: (C)

Exp: According to havel-hakimi theorem

(1,1,1,1,1,1) is graphic iff<1,1,1,1,0> is graphic

(0,1,1,1,1) is graphic iff (0,1,1,0) is graphic

(0,0,1,1) is graphic iff (0,0,0) is graphic

Since (0,0,0) is graphic (1,1,1,1,1,1) is also graphic.

(The process is always finding maximum degree and removing it from degree sequence, subtract 1 from each degree for d times from right to left where d is maximum degree)

(2,2,2,2,2,2) is graphic iff (2,2,22-1,2-1) = (2,2,2,1,1) is graphic.

(1,1,2,2,2) is graphic iff (1,1,1,1) is graphic.

(1,1,1,1) is graphic iff (0,1,1)

(0,1,1) is graphic iff (0,0) is graphic.

Since (0,0) is graphic (2,2,2,2,2,2) is also graphic.

Consider option C now.

(3,3,3,1,0,0)→(0,0,1,3,3,3) is graphic iff (0,0,0,2,2) is graphic.

Note that before applying the havel-hakimi step degree sequence should be in non-increasing order.

(0,0,0,2,2) is graphic iff (0,0,-1,1) is graphic.

Since (0,0,-1,1) is not graphic (3,3,3,1,0,0) is also not graphic.

53. Which one of the following propositional logic formulas is TRUE when exactly two of p, q, and r are **TRUE**?

(A) $((p \leftrightarrow q) \wedge r) V (p \wedge q \wedge \sim r)$
(B) $(\sim (p \leftrightarrow q) \wedge r) V (p \wedge q \wedge \sim r)$
(C) $((p \rightarrow q) \wedge r) V (p \wedge q \wedge \sim r)$
(D) $(\sim (p \leftrightarrow q) \wedge r) \wedge (p \wedge q \wedge \sim r)$

Answer: (B)

Exp: P = T q=F and r=T

Option A will become false.

Option C will become false.

Option D is always false.

54. Given the following schema:

employees(emp-id, first-name, last-name, hire-date,

dept-id, salary)

departments(dept-id, dept-name, manager-id, location-id)

You want to display the last names and hire dates of all latest hires in their respective departments in the location ID 1700. You issue the following query:

SQL>SELECT last-name, hire-date

FROM employees

WHERE (dept-id, hire-date) IN

(SELECT dept-id, MAX(hire-date)

FROM employees JOIN departments USING(dept-id)

WHERE location-id = 1700

GROUP BY dept-id);

What is the outcome?

(A) It executes but does not give the correct result.

(B) It executes and gives the correct result.

(C) It generates an error because of pairwise comparison.

(D) It generates an error because the GROUP BY clause cannot be used with table joins in a sub-query.

Answer: (B)

Exp: In the inner sub query, "employees" and "departments" tables are joined by "using" clause (first Cartesian product of those two tables will be done and then and wherever these is a match on the dept-ids that tuple will be filtered). After this, the tuples of the resultant table will be filtered by using the condition "location-id=1700" and then will grouped on dept-id(all the tuples having equal values under dept-id will come into one group). After grouping, the columns dept-id in location-id 1700 and maximum of hire dates in that respective dept-id will be selected. Format of the tuples in the resultant table will be dept-id in location-id 1700 along with the latest hire date in the respective dept (two columns). Outer query takes each tuple from "employees" table and it will check whether dept-id and hire-date pair for this tuple is contained in the table given by inner sub query. If this is the case it will display the last-name of respective employee

IN operator compares one or multiple expressions on the left side of the operator to a set of one or more values on the right side of the operator. When using multiple expressions (like 2 columns - pair wise comparison), the number and data types of expressions in the list must match on both sides of the operator.

55. Consider two processors P_1 and P_2 executing the same instruction set. Assume that under identical conditions, for the same input, a program running on P_2 takes 25% less time but incurs 20% more CPI (clock cycles per instruction) as compared to the program running on P_1. If the clock frequency of P_1 is 1GHz, then the clock frequency of P_2 (in GHz) is _________.

Answer: (1.6)

Exp: 1 cycle time for $p_1 = \frac{10^9}{1GH} = 1 n.s$

Assume p_1 takes 5 cycles for a program then p_2 takes 20% more, means, 6 cycles.

p_2 Takes 25% less time, means, if p_1 takes 5 n.s, then p_2 takes 3.75 n.s.

Assume p_2 clock frequency is x GHz.

p_2 Taken 6 cycles, so $\frac{6 \times 10^9}{x\ GH} = 3.75,\ x = 1.6$

Q. No. 1 – 5 Carry One Mark Each

1. Choose the most appropriate phrase from the options given below to complete the following sentence.

   India is a post-colonial country because

   (A) it was a former British colony

   (B) Indian Information Technology professionals have colonized the world

   (C) India does not follow any colonial practices

   (D) India has helped other countries gain freedom

Answer: (A)

2. Who ___________ was coming to see us this evening?

   (A) you said (B) did you say (C) did you say that (D) had you said

Answer: (B)

3. Match the columns.

Column 1	Column 2
(1) eradicate	(P) misrepresent
(2) distort	(Q) soak completely
(3) saturate	(R) use
(4) utilize	(S) destroy utterly

   (A) 1:S, 2:P, 3:Q, 4:R (B) 1:P, 2:Q, 3:R, 4:S

   (C) 1:Q, 2:R, 3:S, 4:P (D) 1:S, 2:P, 3:R, 4:Q

Answer: (A)

4. What is the average of all multiples of 10 from 2 to 198?

   (A) 90 (B) 100 (C) 110 (D) 120

Answer: (B)

Exp:

$$\left.\begin{array}{l} 10+190 \rightarrow \\ 20-180 \rightarrow \\ : \\ : \\ 90-110 \\ 100 \end{array}\right\} \begin{array}{l} 200 \\ \\ 9 \end{array} \quad \Rightarrow \frac{[(200)\times 9+100]}{19} = \frac{1900}{19} = 100$$

5. The value of $\sqrt{12+\sqrt{12+\sqrt{12+....}}}$ is

   (A) 3.464 (B) 3.932 (C) 4.000 (D) 4.444

Answer: (C)

Exp: $\text{let} = \sqrt{12+\sqrt{12+\sqrt{12+....}}} = y$

$\Rightarrow \sqrt{12+y} = y$

$\Rightarrow 12+y = y^2$

$\Rightarrow (y-4)(y+3) = 0$

$\Rightarrow y = 4,\ y = -3$

Q. No. 6 – 10 Carry Two Marks Each

6. The old city of Koenigsberg, which had a German majority population before World War 2, is now called Kaliningrad. After the events of the war, Kaliningrad is now a Russian territory and has a predominantly Russian population. It is bordered by the Baltic Sea on the north and the countries of Poland to the south and west and Lithuania to the east respectively. Which of the statements below can be inferred from this passage?

(A) Kaliningrad was historically Russian in its ethnic make up

(B) Kaliningrad is a part of Russia despite it not being contiguous with the rest of Russia

(C) Koenigsberg was renamed Kaliningrad, as that was its original Russian name

(D) Poland and Lithuania are on the route from Kaliningrad to the rest of Russia

Answer: (B)

7. The number of people diagnosed with dengue fever (contracted from the bite of a mosquito) in north India is twice the number diagnosed last year. Municipal authorities have concluded that measures to control the mosquito population have failed in this region.

Which one of the following statements, if true, does not contradict this conclusion?

(A) A high proportion of the affected population has returned from neighbouring countries where dengue is prevalent

(B) More cases of dengue are now reported because of an increase in the Municipal Office's administrative efficiency

(C) Many more cases of dengue are being diagnosed this year since the introduction of a new and effective diagnostic test

(D) The number of people with malarial fever (also contracted from mosquito bites) has increased this year

Answer: (D)

8. If x is real and $\left|x^2-2x+3\right| = 11$, then possible values of $\left|-x^3+x^2-x\right|$ include

(A) 2, 4 (B) 2, 14 (C) 4, 52 (D) 14, 52

Answer: (D)

Exp: $x^2 - 2x + 3 = 11$

$\Rightarrow (x-4)(x+2) = 0 \Rightarrow x = 4, x = -2$

Values of $\left|-x^3 + x^2 - x\right|$

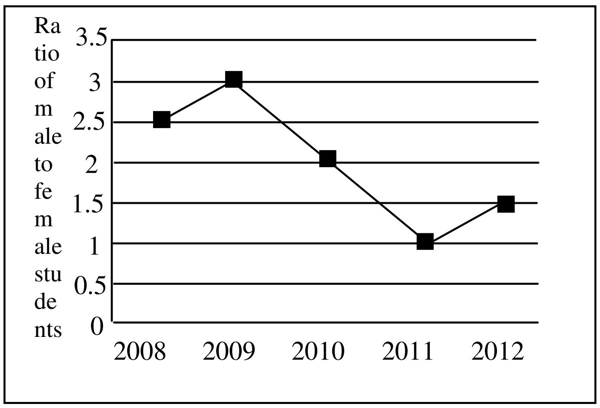
For $x = 4$

Value $= 52$

for $x = -2$

Value $= 14$

9. The ratio of male to female students in a college for five years is plotted in the following line graph. If the number of female students doubled in 2009, by what percent did the number of male students increase in 2009?



Answer: (140)

Exp: $\frac{m}{f} = 3$ $\quad$ $\frac{m}{f} = 2.5$ m=2.5f

$\frac{m'}{2f} = 3$

$m' = 6f$

$= \frac{m' - m}{m}$

$\% \uparrow = \frac{3.5f}{2.5f} \times 100$

$= \frac{7}{8} = 1.4$

$\boxed{\% \uparrow = 140\%}$

10. At what time between 6 *a.m.* and 7 *a.m* will the minute hand and hour hand of a clock make an angle closest to 60°?

(A) 6: 22 *a. m.* (B) 6:27 *a.m.* (C) 6: 38 *a.m.* (D) 6:45 *a.m.*

Answer: (A)

Exp: Angle by minute's hand

$60 \text{ min} \rightarrow 360^{o}$

$1 \text{min} \rightarrow \frac{360}{60} = 6^{o}$

$8 \text{min} \rightarrow 48^{o}$

$\text{Angle} \rightarrow 48^{o}$ with number '6'

Angle by hours hand

$60 \text{ min} = 30^{o}$

$22 \text{ min} \rightarrow \frac{30}{60} \times 22$

$= 11$

Total Angle=48+11=59°.

Q. No. 1 – 25 Carry One Mark Each

1. The security system at an IT office is composed of 10 computers of which exactly four are working. To check whether the system is functional, the officials inspect four of the computers picked at random (without replacement). The system is deemed functional if at least three of the four computers inspected are working. Let the probability that the system is deemed functional be denoted by p Then 100p= _____________.

Answer: (11.85 - 11.95)

Exp: p= P [at least three computers are working]

= P (3 or 4 computers working)

$$=\frac{\left(4_{C_3}\right)\times\left(6_{C_1}\right)}{10_{C_4}}+\frac{4_{C_4}}{10_{C_4}}=\frac{5}{42}$$

$$\Rightarrow 100\,p = 11.9.$$

2. Each of the nine words in the sentence "**The quick brown fox jumps over the lazy og**" is written on a separate piece of paper. These nine pieces of paper are kept in a box. One of the pieces is drawn at random from the box. The *expected* length of the word drawn is _____________. (The answer should be rounded to one decimal place.

Answer: (3.8889)

Exp: Given words are

THE, QUICK, BROWN, FOX, JUMPS, OVER, THE, LAXY, DOG

LET X be the random variable such that X =length of the word

The Length of the words THE, FOX, THE, DOG is 3

The Length of the words OVER, LAXY is 4

The length of the words QUICK, BROWN, JUMPS, is 5

The corresponding probabilities are given below

x	3	4	5
P(X)	4/9	2/9	3/9

Expected length of the word= $\sum xp(x) = 3\left(\frac{4}{9}\right)+4\left(\frac{2}{9}\right)+5\left(\frac{3}{9}\right)=3.8889$

3. The maximum number of edges in a bipartite graph on 12 vertices is _________________________.

Answer: (36)

Exp: The number of edges in a bipartite graph on n-vertices is atmost $\frac{n^2}{4}$

The maximum number of edges in a bipartite graph on 12 –vertices is $\frac{n^2}{4}=\frac{12\times 12}{4}=36$

4. If the matrix A is such that

$$A = \begin{bmatrix} 2 \\ -4 \\ 7 \end{bmatrix} \begin{bmatrix} 1 & 9 & 5 \end{bmatrix}$$

Then the determinant of A is equal to ________.

Answer: (0)

Exp: $A = \begin{bmatrix} 2 & 18 & 10 \\ -4 & -36 & 20 \\ 7 & 63 & 35 \end{bmatrix}$

$\Rightarrow |A| = 0 \;\; (\because R_2 = -2R_1).$

5. A non-zero polynomial f(x) of degree 3 has roots at x = 1,x = 2 and x = 3. Which one of the following must be TRUE?

(A) f(0) f(4) < 0

(B) f(0) f(4) > 0

(C) f(0) + f(4) > 0

(D) f(0) + f(4) < 0

Answer: (A)

Exp: Since, the roots of f(x) = 0 i.e., x = 1, 2, 3 lies between 0 and 4 and f(x) is of degree 3

$\therefore$ f(0) and f(4) are of opposite signs

$\Rightarrow$ f(0).f(4)<0.

6. The dual of a Boolean function $F\left(x_1, x_2, ..., x_{n,} +, ., '\right)$, written as F^D, is the same expression as that of F with + and swapped. F is said to be self-dual if F = F^D. The number of self-dual functions with n Boolean variables is

(A) 2^n

(B) 2^{n-1}

(C) 2^{2^n}

(D) $2^{2^{n-1}}$

Answer: (D)

Exp: A function F is self dual if it has equal number of minterms and maxterms, also mutually exclusive terms should not be included.

The number of mutually exclusive terms (pair wise) is $\frac{2^n}{2} = 2^{n-1}$

Number of functions possible by taking any of the one term from the above mentioned mutually exclusive pair is $= 2^{2^{n-1}}$.

7. Let $k = 2^n$. A circuit is built by giving the output of an n-bit binary counter as input to an n-to-2^n bit decoder. This circuit is equivalent to a

(A) k-bit binary up counter.

(B) k-bit binary down counter.

(C) k-bit ring counter.

(D) k-bit Johnson counter.

Answer: (C)

Exp: In case of decoder output, single output will be 1 and remaining will be zero at a time. The output that is high will give the count of the ring counter at that time.

8. Consider the equation $(123)_5 = (x8)_y$ with x and y as unknown. The number of possible solutions is _____ .

Answer: (3)

Exp : $(123)_5 = (x8)_y$

Converting both sides to decimal:

$\Rightarrow 25+10+3 = xy+8$

$\Rightarrow xy+8 = 38 \Rightarrow xy = 30$

$\Rightarrow x = 1, y = 30$

or , $x = 2, y = 15$ or, $x = 3,\ y = 10$

$\therefore$ Total number of solutions: 3

9. A 4-way set-associative cache memory unit with a capacity of 16 KB is built using a block size of 8 words. The word length is 32 bits. The size of the physical address space is 4 GB. The number of bits for the TAG field is _____

Answer: (20)

Exp: Physical address size = 32 bits

Cache size $= 16\text{k bytes} = 2^{14}$ Bytes

block size $= 8$ words $= 8\times 4$ Byte $= 32$ Bytes

$(\text{where each word} = \text{b Bytes})$

No. of blocks $= \dfrac{2^{14}}{2^5} = 2^9$

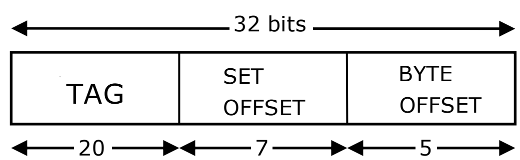
block offset $= 9^{\text{bits}}$

No. of sets $= \dfrac{2^9}{4} = 2^7$

set ofset = 7 bits

Byte offset $= 8\times 4$ Bytes $= 32$ Byte $= 2^5 = 5$ bits

TAG $= 32-(7+5) = 20$ bits



10. Consider the function func shown below:

```
int func(int num) {
int count = 0;
    while (num) {
    count++;
     num>>= 1;
}
return (count);
}
```

The value returned by func(435)is __________.

Answer: (9)

Exp:
```
int func (int num)
{
int count = 0;
while (num)                //After each right shift, checks whether the num value is not zero//
    {
    count ++;
    num >>= 1;    //shifts all bits of num one slot to the right//
    }
return(count);
}
```

Initially   num = 110110011, count = 0

count = 1; num = 101100110 after 1st right shift

count =2; num = 011001100 after 2nd right shift

:

:

Count = 9; num = 000000000 after 9th right shift.

After nine right shifts, num = 0; and while loop terminates count = 9 will be returned.

11. Suppose n and p are unsigned int variables in a C program. We wish to set p to ${}^{n}C_{3}$. If n is large, which one of the following statements is most likely to set p correctly?

(A) p = n * (n – 1) * (n-2) / 6;

(B) p = n * (n – 1) / 2 * (n-2) / 3;

(C) p = n * (n – 1) / 3 * (n-2) / 2;

(D) p = n * (n – 1) / 2 * (n-2) / 6.0;

Answer: (B)

Exp: $P = n_{C_3} = \dfrac{n(n-1)(n-2)}{6}$

It we multiply n, (n-1), (n-2) at once, it might go beyond the range of unsigned integer (resulting overflow). So options (A) and (D) are rested out. If n is even or odd n×(n-1)/2 will always result in integer value (no possibility of truncation, so more accuracy) where as incase of n*(n-1)/3, its not certain to get integer always (truncation possible, so less accuracy).

$$P = \underbrace{n*(n-1)/2}_{p_1} * \underbrace{(n-2)/3}_{p_2}$$

As P_1 will be having no error, resultant p will be more accurate.

$$P = \underbrace{n*(n-1)/3}_{p_1} * \underbrace{(n-2)/2}_{p_2}$$

As there is a possibility of truncation in P_1, there will be less accuracy in final result of P.

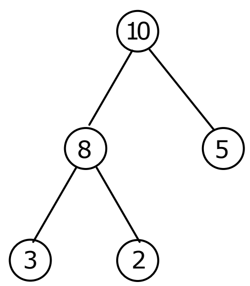
12. A priority queue is implemented as a Max-Heap. Initially, it has 5 elements. The level-order traversal of the heap is: 10, 8, 5, 3, 2. Two new elements 1 and 7 are inserted into the heap in that order. The level-order traversal of the heap after the insertion of the elements is:

(A) 10, 8, 7, 3, 2, 1, 5 (B) 10, 8, 7, 2, 3, 1, 5

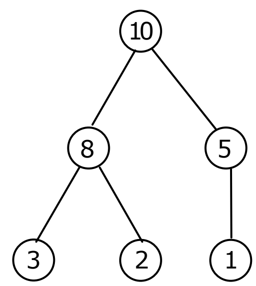
(C) 10, 8, 7, 1, 2, 3, 5 (D) 10, 8, 7, 5, 3, 2, 1

Answer: (A)

Exp: Initial max-heap is

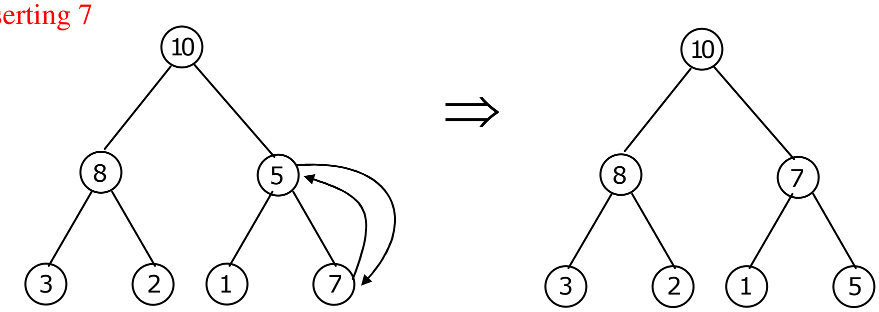


after inserting 1



Heapification is not required as it satisfies max-heap property

After inserting 7



Hence level order traversal is 10, 8, 7, 3, 2, 1, 5

13. Which one of the following correctly determines the solution of the recurrence relation with $T(1) = 1$?

$$T(n) = 2T\left(\frac{n}{2}\right) + \log n$$

(A) $\theta(n)$ (B) $\theta(n\log n)$ (C) $\theta(n^2)$ (D) $\theta(\log n)$

Answer: (A)

Exp: By Master's theorem case (i) $T(n)$ is $O(n)$

Here $a = 2, \quad b = 2, \quad f(n) = \log n$

$\log_b^a = \log_2^2 = 1$

we can choose $\in > 0$, in such a way that

$f(n) = O\left(n\log_b^{a-\in}\right)$; i.e., $\log n = O\left(n\log_b^{a-\in}\right)$

By master theorem, If $f(n) = O\left(n\log_b^{a-\in}\right)$ for some $\in > 0$, then

$T(n) = \theta\left(n\log_b^a\right) = \theta(n)$

14. Consider the tree arcs of a BFS traversal from a source node **W** in an unweighted, connected, undirected graph. The tree **T** formed by the tree arcs is a data structure for computing

(A) the shortest path between every pair of vertices.

(B) the shortest path from **W** to every vertex in the graph.

(C) the shortest paths from **W** to only those nodes that are leaves of **T**.

(D) the longest path in the graph.

Answer: (B)

Exp: One of the application of BFS algorithm is to find the shortest path between nodes u and v.

But in the given question the BFS algorithm starts from the source vertex w and we can find the shortest path from w to every vertex of the graph

15. If $L_1 = \{a^n \mid n \geq 0\}$ and $L_2 = \{b^n \mid n \geq 0\}$, Consider

(I) $L_1.L_2$ is a regular language

(II) $L_1.L_2 = \{a^n b^n \mid n \geq 0\}$

Which one of the following is CORRECT?

(A) Only (I) (B) Only (II)

(C) Both (I) and (II) (D) Neither (I) nor (II)

Answer: (A)

Exp: L1.L2 is also regular since regular languages are closed under concatenation.

But L1.L2 is not $\{a^n b^n \mid n \geq 0\}$ because both the variable is independent in both languages.

16. Let $A \leq_m B$ denotes that language A is mapping reducible (also known as many-to-one reducible) to language B. Which one of the following is FALSE?

(A) If $A \leq_m B$ and B is recursive then A is recursive.

(B) If $A \leq_m B$ and A is undecidable then B is undecidable.

(C) If $A \leq_m B$ and B is recursively enumerable then A is recursively enumerable.

(D) If $A \leq_m B$ and B is not recursively enumerable then A is not recursively enumerable.

Answer: (D)

Exp: A language A is mapping reducible to a language B, if there is a computable function $f: \varepsilon^* \rightarrow \varepsilon^*$ where for every $w, w \in A \Leftrightarrow f(w) \in B$

If $A \leq mB$ and B is Turing recognizable then A is Turing recognizable.

If $A \leq mB$ and B is not recursively enumerable then A is not recursively enumerable

17. Consider the grammar defined by the following production rules, with two operators □ and +

$S \to T * P$

$T \to U \mid T * U$

$P \to Q + P \mid Q$

$Q \to Id$

$U \to Id$

Which one of the following is TRUE?

(A) + is left associative, while * is right associative

(B) + is right associative, while * is left associative

(C) Both + and * are right associative

(D) Both + and * are left associative

Answer: (B)

Exp: $S \to T \times P$

$T \to U \mid T \times U$

$P \to Q + P \mid Q$

$Q \to Id$

$U \to Id$

As the production rule $T \to T \times U$ is defined as left recursive rule, so * is left associate operator.

As the production rule $P \to Q + P$ is defined as right recursive rule, so + is right associative operator.

18. Which one of the following is **NOT** performed during compilation?

(A) Dynamic memory allocation (B) Type checking

(C) Symbol table management (D) Inline expansion

Answer: (A)

Exp: Symbol table management is done during compitation to store and retriew the information about tokens. Type checking is one of the check performed during semantic analysis of compitation.

Inline expansion is a compiler optimization that replaces a function call by the bodyof respective function.

Dynamic memory allocation is when an executing pregoram request the oprating system to give it a block of main memory, so ti is performed during sum time not during complete time.

Option (A) is answer

19. Which one of the following is TRUE?

(A) The requirements document also describes how the requirements that are listed in the document are implemented efficiently.

(B) Consistency and completeness of functional requirements are always achieved in practice.

(C) Prototyping is a method of requirements validation.

(D) Requirements review is carried out to find the errors in system design.

Answer: (C)

20. A FAT (file allocation table) based file system is being used and the total overhead of each entry in the FAT is 4 bytes in size. Given a 100 x 10^6 bytes disk on which the file system is stored and data block size is 10^3 bytes, the maximum size of a file that can be stored on this disk in units of 10^6 bytes is ____________.

Answer: (99.55 to 99.65)

Exp: Number of entries in the FAT = Disk Capacity/Block size = $10^8/10^3 = 10^5$

- ⇨ Total space consumed by FAT = $10^5 * 4$ B = $0.4 * 10^6$ B
- ⇨ Maximum size of file that can be stored = $100 * 10^6 - 0.4 * 10^6 = 99.6 * 10^6$ B
- ⇨ Answer: 99.6

21. The maximum number of super keys for the relation schema R (E, F, G, H) with E as the key is __________.

Answer: (8)

Exp: The maximum number of super keys for the relation schema $R(E,F,G,H)$ with E as the key is $2^3 = 8$ as any subset of non key attributes along with key attribute will form the super key of R.

As we have 3 nonkey all (F, G and H) so subsets will be 2^3

22. Given an instance of the STUDENTS relation as shown below:

Student D	StudentName	Student Email	Student Age	CPI
2345	Shankar	Shankar@math	X	9.4
1287	Swati	swati@ee	19	9.5
7853	Shankar	Shankar@cse	19	9.4
9876	Swati	swati@mech	18	9.3
8765	Ganesh	ganesh@civil	19	8.7

For (StudentName, StudentAge) to be a key for this instance, the value X should NOT be equal to____________.

Answer: (19)

Exp: For (Student Name, student age) to be a key for given instance of STUDENTS relation, the pair value should not get repeated in any two tuples p and q (uniqueness in forced by the definition of key)

Tuple	Student Name	Student Age
P	Shankar	$\otimes \rightarrow$ should not be 19
Q	Shankar	19

23. Which one of the following is TRUE about the interior gateway routing protocols – Routing Information Protocol (RIP) and Open Shortest Path First (OSPF)?

(A) RILP uses distance vector routing and OSPF uses link state routing

(B) OSPF uses distance vector routing and RIP uses link state routing

(C) Both RIP and OSPF use link state routing

(D) Both RIP and OSPF use distance vector routing

Answer: (A)

Exp: RIP Uses Distance Vector Routing and OSPF uses Link State Routing.

24. Which one of the following socket API functions converts an unconnected active TCP socket into a passive socket?

(A) connect (B) bind (C) listen (D) accept

Answer: (C)

Exp:

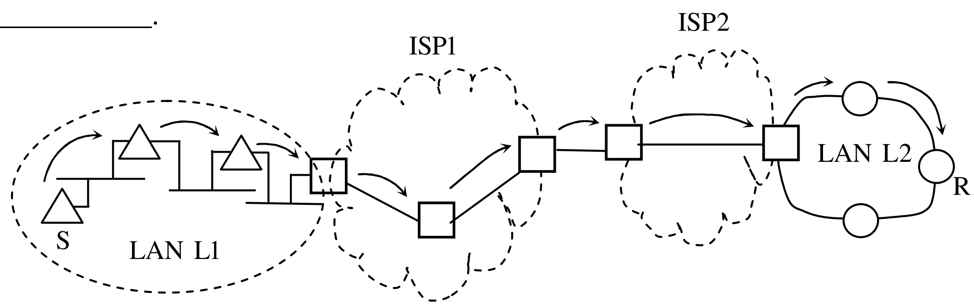
(a) The **connect function** is used by a TCP client to establish a connection with a TCP server.

(b) The **bind function** assigns a local protocol address to a socket. With the Internet protocols, the protocol address is the combination of either a 32-bit IPv4 address or a 128-bit IPv6 address, along with a 16-bit TCP or UDP port number.

(c) The **listen function** converts an unconnected socket into a passive socket, indicating that the kernel should accept incoming connection requests directed to this socket.

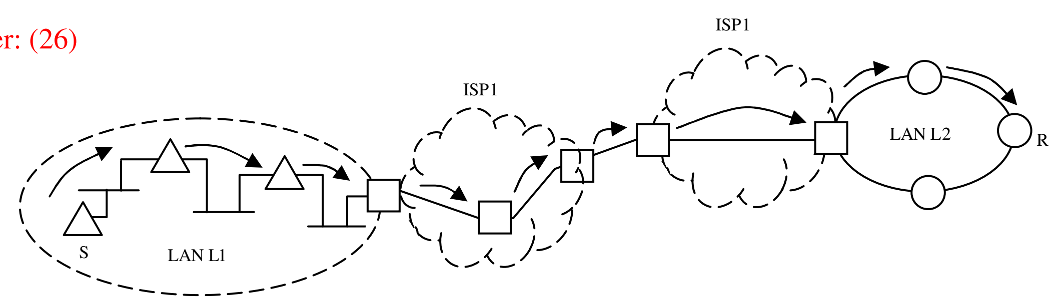
(d) The **accept function** is called by a TCP server to return the next completed connection from the front of the completed connection queue. If the completed connection queue is empty, the process is put to sleep (assuming the default of a blocking socket).

25. In the diagram shown below, L1 is an Ethernet LAN and L2 is a Token-Ring LAN. An IP packet originates from sender S and traverses to R, as shown. The links within each ISP and across the two ISPs, are all point-to-point' optical links. The initial value of the TTL field is 32. The maximum possible value of the TTL field when R receives the datagram is ____________.



Answer: (26)

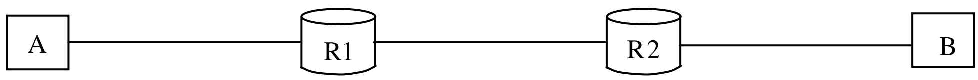
Exp:



The TTL field is set by the sender of the datagram, and reduced by every router on the route to its destination. So, there are 5visits at 5 routers and one visit at receiver R in above figure which leads 32 – 6 = 26.

Q. No. 26 – 55 Carry Two Marks Each

26. Consider the store and forward packet switched network given below. Assume that the bandwidth of each link is 10^6 bytes / sec. A user on host A sends a file of size 10^3 bytes to host B through routers R1 and R2 in three different ways. In the first case a single packet containing the complete file is transmitted from A to B. In the second case, the file is split into 10 equal parts, and these packets are transmitted from A to B. In the third case, the file is split into 20 equal parts and these packets are sent from A to B. Each packet contains 100 bytes of header information along with the user data. Consider only transmission time and ignore processing, queuing and propagation delays. Also assume that there are no errors during transmission. Let T1, T2 and T3 be the times taken to transmit the file in the first, second and third case respectively. Which one of the following is CORRECT?



(A) T1 < T2 < T3 (B) T1 > T2 > T3

(C) T2 = T3, T3 < T1 (D) T1 = T3, T3 > T2

Answer: (D)

Exp: Given Bandwidth = 10^6 bytes/sec

$L=10^3$ bytes

Case: 1

$L = 1000$ bytes

Header size $= 100$ bytes

Total Frame size $= 1000 + 100 = 1100$ bytes

$$\therefore T_x = \frac{1100 \times 8}{10^6 \times 8} = 1100\ \mu s$$

So, $T_1 = 3300\ \mu s$

Case: 2

$L = 100$ bytes

Header size $= 100$ bytes

Total Frame size $= 100 + 100 = 200$ bytes

$$\therefore T_x = \frac{200 \times 8}{10^6 \times 8} = 200\ \mu s \text{ for 1 packet}$$

For 10 packets $\Rightarrow Tx = 2000\mu s$

So, $T_2 = 2000 + 200 + 200 = 2400\ \mu s$

Case: 3

$L = 50$ bytes

Header size $= 100$ bytes

Total Frame size $= 50 + 100 = 150$ bytes

$\therefore T_x = \dfrac{150 \times 8}{10^6 \times 8} = 150\,\mu s$ for 1 packet

For 20 packets $\Rightarrow Tx = 3000\mu s$

So, $T_3 = 3000 + 150 + 150 = 3300\,\mu s$

$\therefore\ T_1 = T_3$

$T_3 > T_2$

27. An IP machine Q has a path to another IP machine H via three IP routers R1, R2, and R3.

Q—R1—R2—R3—H

H acts as an HTTP server, and Q connects to H via HTTP and downloads a file. Session layer encryption is used, with DES as the shared key encryption protocol. Consider the following four pieces of information:

[I1] The URL of the file downloaded by Q

[I2] The TCP port numbers at Q and H

[I3] The IP addresses of Q and H

[I4] The link layer addresses of Q and H

Which of I1, I2, I3, and I4 can an intruder learn through sniffing at R2 alone?

(A) Only I1 and I2 (B) Only I1 (C) Only I2 and I3 (D) Only I3 and I4

Answer: (C)

Exp: An Intruder can't learn [I1] through sniffing at R2 because URLs and Download are functioned at Application layer of OSI Model.

An Intruder can learn [I2] through sniffing at R2 because Port Numbers are encapsulated in the payload field of IP Datagram.

An Intruder can learn [I3] through sniffing at R2 because IP Addresses and Routers are functioned at network layer of OSI Model.

An Intruder can't learn [I4] through sniffing at R2 because it is related to Data Link Layer of OSI Model.

28. A graphical HTML browser resident at a network client machine *Q* accesses a static HTML webpage from a HTTP server *S*. The static HTML page has exactly one static embedded image which is also at *S*. Assuming no caching, which one of the following is correct about the HTML webpage loading (including the embedded image)?

(A) Q needs to send at least 2 HTTP requests to S, each necessarily in a separate TCP connection to server S

(B) Q needs to send at least 2 HTTP requests to S, but a single TCP connection to server S is sufficient

(C) A single HTTP request from Q to S is sufficient, and a single TCP connection between Q and S is necessary for this

(D) A single HTTP request from Q to S is sufficient, and this is possible without any TCP connection between Q and S

Answer: (B)

29. Consider the following schedule S of transactions T1, T2, T3, T4:

<table>
<tr><th>T1</th><th>T2</th><th>T3</th><th>T4</th></tr>
<tr><td rowspan="4">Writes [x]
Commit</td><td>Reads[X]</td><td></td><td></td></tr>
<tr><td></td><td>Writes[X]
Commit</td><td></td></tr>
<tr><td>Writes[Y]
Reads [Z]
Commit</td><td></td><td></td></tr>
<tr><td></td><td></td><td>Reads[X]
Reads[Y]
Commit</td></tr>
</table>

Which one of the following statements is CORRECT?

(A) S is conflict-serializable but not recoverable

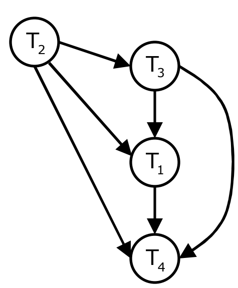
(B) S is conflict-serializable but is recoverable

(C) S is both conflict-serializable and recoverable

(D) S is neither conflict-serializable nor is it recoverable

Answer: (C)

Exp: The precedence graph of schedule s is a follows.



$\Rightarrow$ No cycle, so S is conflict serializable

In the schedule S of transactions T_1, T_2, T_3 and T_4 for each pair of transaction T_i and T_j, such that T_j reads a data item previously written by T_i the commit operation of T_j appears after the commit operation of T_i hence the schedule is recoverable schedule.

30. Consider a join (relation algebra) between relations r(R)and s(S) using the nested loop method. There are 3 buffers each of size equal to disk block size, out of which one buffer is reserved for intermediate results. Assuming size(r(R))<size(s(S)), the join will have fewer number of disk block accesses if

(A) relation r(R) is in the outer loop.

(B) relation s(S) is in the outer loop.

(C) join selection factor between r(R) and s(S) is more than 0.5.

(D) join selection factor between r(R) and s(S) is less than 0.5.

Answer: (A)

Exp: A join between r(R) and s (S) using nested loop method will be as follows.

For each tuple r in R do

For each tuple s in S do

If r and s satisfy the join condition then output the tuple <r,s>

This algorithm will involve $n_r*b_s+b_r$ block transfers and n_r+b_r seeks, where b_r and b_s are number of blocks in relations R and S respectively and n_r is number of tuple in relation R. Now to have less block accesses, n_r should be less and it is already given that |R|<|S|. Relation r(R) should be in the outer loop to have fewer number of disk block accesses.

31. Consider the procedure below for the *Producer-Consumer* problem which uses semaphores:

Semaphore n = 0;

Semaphore s = 1;

```
Void producer ( )                    Void consumer( )
{                                      {
    while (true)                       while(true)
    {                                  {
    Produce ( );                       semWait (s) ;
    SemWait (s);                       semWait (n) ;
    addToBuffer ( );                 removeFromBuffer ( ) ;
    semSignal (s);                     semsignal (s);
    semSignal (n);                     consume ( ) ;
    }                                  }
}                                        }
```

Which one of the following is TRUE?

(A) The producer will be able to add an item to the buffer, but the consumer can never consume it.

(B) The consumer will remove no more than one item from the buffer.

(C) Deadlock occurs if the consumer succeeds in acquiring semaphore **s** when the buffer is empty.

(D) The starting value for the semaphore **n** must be 1 and not 0 for deadlock-free operation.

Answer: (C)

Exp: (A) The producer will be able to add an item to the buffer, but the consumer can never consume if given statement is false, because once producer produces an item and places in buffer, the next turn to execute can be given to consumer ( ). [The value of s = 1 and n=1]. So consumer will be definitely able to consume it by performing successful down operations on s and n.

(B) The consumer will remove no more than one item from the buffer.

Given statement is false as if p( ) produces and adds to buffer, (c) will consume the added item, this sequence of alteration (p and c) will always make consumer to remove items from buffer.

This statement would have been true if it was said that the consumer will remove no more than one item from the buffer one after the other. (at a time).

(C) Dead lock occurs if the consumer succeeds in acquiring semaphore's' when the buffer is empty. Given statement is true as when buffer is empty initially if consumer gets the turn to execute as follows:-

$S = 1, \quad n = 0;$

consumer( )
{
  while (True)
  {
    $p(s); [s = \cancel{1}0]$
    $p(s); [m = 0;$ it blocks consumer$]$
    }
}

producer( )
{
  while (True)
  {
    producer( );
    $p(s); [s = 0;$ it blocks $p(\ )]$
    }
}

So from the above execution both producer and consumer goes in block state waiting for each other to wake them up and hence dead lock occurs.

(D) Even if the starting value for the semaphore 'n' becomes 1, there will be invalid execution of consumer on buffer empty condition, which should not happen. So statement is false.

32. Three processes A, B and C each execute a loop of 100 iterations. In each iteration of the loop, a process performs a single computation that requires t_c CPU milliseconds and then initiates a single I/O operation that lasts for t_{io} milliseconds. It is assumed that the computer where the processes execute has sufficient number of I/O devices and the OS of the computer assigns different I/O devices to each process. Also, the scheduling overhead of the OS is negligible. The processes have the following characteristics:

Process id	t_c	t_{io}
A	100ms	500ms
B	350ms	500ms
C	200ms	500ms

The processes A, B, and C are started at times 0, 5 and 10 milliseconds respectively, in a pure time sharing system (round robin scheduling) that uses a time slice of 50 milliseconds. The time in milliseconds at which process C would ***complete*** its first I/O operation is ___________.

Answer: (1000)

Exp:

Process id	t_c	t_{io}	A.T	TQ = 50ms
A	100 ms	500 ms	0 ms	
B	350 ms	500 ms	5 ms	
C	200 ms	500 ms	10 ms	

The Gantt chart for Round robin algorithm for the first iteration execution for each of the 3 processes is as follows:

R .Q ~~A~~ ~~B~~ ~~C~~ A

A	B	C	A	B	C	B	C	B	C	B

0 50 100 150 200 250 300 350 400 450 500 650

A goes for I/o operation

C goes for I/o operation

After finishing t_c CPU ms at time 500ms, C goes for I/O operation, that needs 500ms more, so the time at which process C would complete its first I/O operations is 500+500 = 1000ms

33. A computer has twenty physical page frames which contain pages numbered 101 through 120. Now a program accesses the pages numbered 1, 2, …, 100 in that order, and repeats the access sequence THRICE. Which one of the following page replacement policies experiences the same number of page faults as the optimal page replacement policy for this program?

(A) Least-recently-used (B) First-in-first-out

(C) Last-in-first-out (D) Most-recently-used

Answer: (D)

Exp: Page reference string for the program will be:-

1, 2, 3, 4, ------------100, 1, 2, 3, 4, ------------100, 1, 2, 3, 4, ------------100,

The current status of 20 frames shows page numbers from 101 to 120.

Implementation of optimal page replacement policy for above given page reference string would be as follows:

0	101	1	40	41	80	81	20	21	60	61	100	1	40	41	80	81
1	102	2	39	42	79	82										
2	103	3	38	43	78	83										
3	104	4	37	44	77	84										
4	105	5	36	45	76	85										
5	106	6	35	46	75	86										
6	107	7	34	47	74	87										
7	108	8	33	48	73	88										
8	109	9	32	49	72	89										
9	110	10	31	50	71	90										
10	111	11	30	51	70	91										
11	112	12	29	52	69	92										
12	113	13	28	53	68	93										
13	114	14	27	54	67	94										
14	115	15	26	55	66	95										
15	116	16	25	56	65	96										
16	117	17	24	57	64	97										
17	118	18	23	58	63	98										
18	119	19	22	59	62	99										
19	120	20	21	60	61	100	1	40	41	80	81	20	21	60	61	100
		↓ 20PF	↓ 20PF	↓ 20PF	↓ 20PF	↓ 20PF	↓ 20PF	↓ 20PF	↓ 20PF	↓ 20PF	↓ 20PF					
		1st time access					2nd time access					3rd time access				

So there would be 300 page faults in total (each access 100 page faults).

Also it is visible that every time a replacement is done for the page which is most recently referred as it will be least recently referred in future. So for the given page reference string optimal page replacement policy is working same as most recently used policy and thus number of page faults will be same in both of them.

34. For a C program accessing **X[i] [j] [k]**, the following intermediate code is generated by a compiler. Assume that the size of an **integer** is 32 bits and the size of a **character** is 8 bits.

t0 = i * 1024

t1 = j * 32

t2 = k * 4

t3 = t1 + t0

t4 = t3 + t2

t5 = X[t4]

Which one of the following statements about the source code for the C program is **CORRECT**?

(A) X is declared as "int X[32] [32] [8]".

(B) X is declared as "int X[4] [1024] [32]".

(C) X is declared as "char X[4] [32] [8]".

(D) X is declared as "char X[32] [16] [2]".

Answer: (A)

Exp: It is given that Size of int is 4B and of char is 1B. The memory is byte addressable.

Let the array be declared as Type X[A][B][C] (where Type = int/char and A,B,C are natural numbers).

From t0 = i*1024, we conclude that B*C*(size of Type) = 1024.

From t1 = j*32, we conclude that C*(size of Type) = 32.

From t2 = k*4, we conclude that size of Type = 4.

⇨ Type = int, and

⇨ C = 8, and

⇨ B = 32.

35. Let < M > be the encoding of a Turing machine as a string over $\Sigma = \{0,1\}$. Let L = {<M> |M is a Turning machine that accepts a string of length 2014}. Then, L is

(A) decidable and recursively enumerable

(B) undecidable but recursively enumerable

(C) undecidable and not recursively enumerable

(D) decidable but not recursively enumerable

Answer: (B)

Exp: The language accepted by the Turing machine is recursively enumerable. If is undecidable as the Turing machine may halt or it may loop for the strings whose length is not equal to 2014.

36. Let $L_1 = w \in \{0,1\}^* \mid w$ has at least as many occurrences of (110)'s as (011)'s}. Let $L_2 = \{w \in \{0,1\}^* \mid$ w has at least as many occurrence of (000)'s as (111)'s}. Which one of the following is TRUE?

(A) L_1 is regular but not L_2

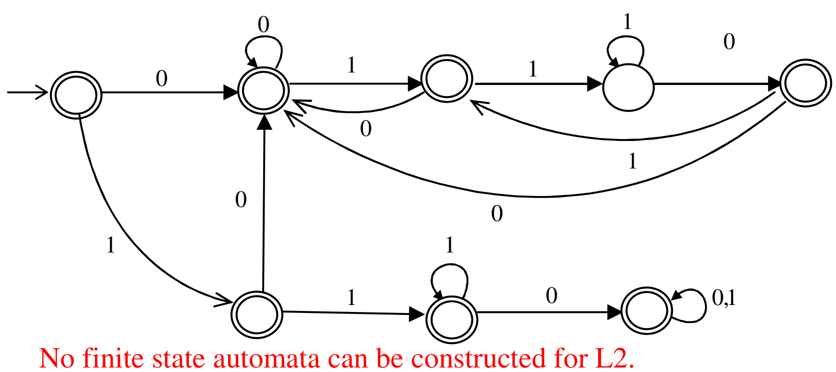
(B) L_2 is regular but not L_1

(C) Both L_1 and L_2 are regular

(D) Neither L_1 nor L_2 are regular

Answer: (A)

Exp: The automaton for L1 is as follows:



No finite state automata can be constructed for L2.

37. Consider two strings $A = "q\ pqrr"$ and $B = "pqprqrp"$. Let x be the length of the longest common subsequence (not necessarily contiguous) between A and B and let y be the number of such longest common subsequences between A and B. Then $x + 10y =$ ___.

Answer: (34)

Exp: Given is

A = "qpqrr" B = "pqprqrp"

The longest common subsequence (not necessarily contiguous) between A and B is having 4 as the length, so x=4 and such common subsequences are as follows:

(1) qpqr

(2) pqrr

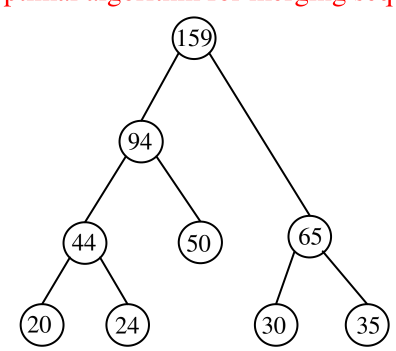
(3) qprr

So y = 3 (the number of longest common subsequences) hence x+10y = 4+10*3 = 34.

38. Suppose P, Q, R, S, T are sorted sequences having lengths 20, 24, 30, 35, 50 respectively. They are to be merged into a single sequence by merging together two sequences at a time. The number of comparisons that will be needed in the worst case by the optimal algorithm for doing this is ____.

Answer: (358)

Exp: The implementation of optimal algorithm for merging sequences is as follows.

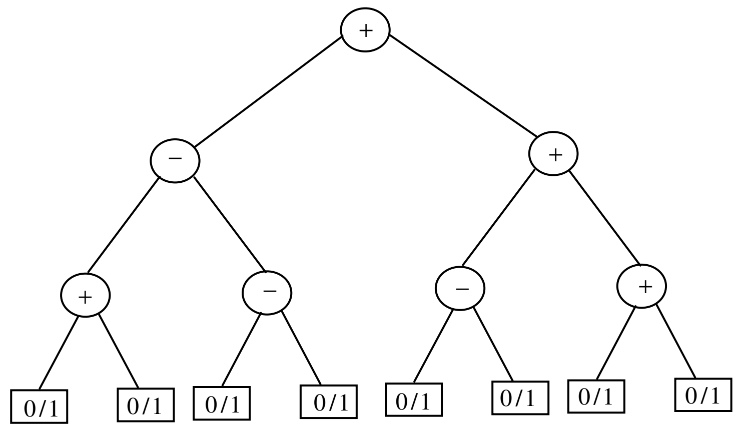


In the above implementation, total number of comparisons is

(44-1)+(94-1)+(65-1)+(159-1) = 358

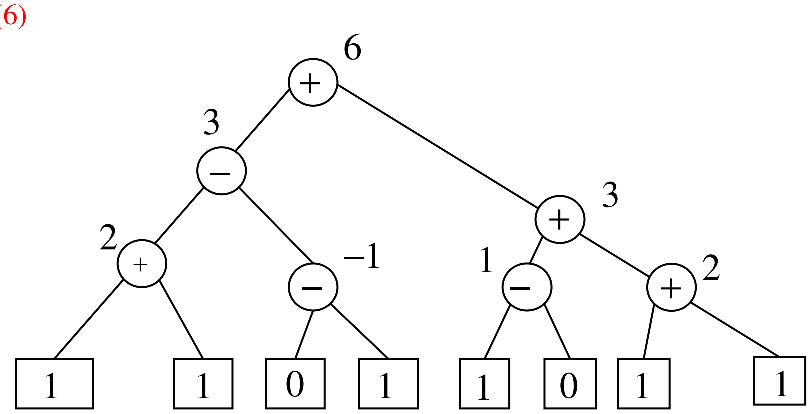
Hint: The number of comparisons for merging two sorted sequences of length m and n is m+n-1.

39. Consider the expression tree shown. Each leaf represents a numerical value, which can either be 0 or 1. Over all possible choices of the values at the leaves, the maximum possible value of the expression represented by the tree is ___.



Answer: (6)

Exp:



So as per the above tree where leaves have been given the values, the maximum possible value of the expression represented by the tree is 6.

40. Consider the following function

```
double  f (double x) {
if ( abs (x*x – 3) <  0. 01) return x;
else return f (x / 2 + 1.5/x);
}
```

Give a value q (to 2 decimals) such that f (q) will return q:______

Answer: (1.72 to 1.74)

Exp: If condition given in function definition should be 'TRUE', for $f(q)$ to return value q.

The condition is as follows:

$\text{if } (\text{abs}(x \times x - 3) < 0.01) \text{ return } x;$

The above condition will be true when x=1.73.

41. Suppose a stack implementation supports an instruction REVERSE, which reverses the order of elements on the stack, in addition to the PUSH and POP instructions. Which one of the following statements is TRUE with respect to this modified stack?

(A) A queue cannot be implemented using this stack.

(B) A queue can be implemented where ENQUEUE takes a single instruction and DEQUEUE takes a sequence of two instructions.

(C) A queue can be implemented where ENQUEUE takes a sequence of three instructions and DEQUEUE takes a single instruction.

(D) A queue can be implemented where both ENQUEUE and DEQUEUE take a single instruction each.

Answer: (C)

Exp: Option (a) is false because queue can be implemented by using the modified stack as by reversing the stack. LIFO will become FIFO.
Implementation of ENQUEUE & DEQUEUE takes four sequence of instructions as follows:

1. Enqueue: Reverse, Push, Revesre
   Dequeue: POP
   (OR)
2. Enqueue: Push
   Dequeue: Reverse, POP, Reverse

42. Consider the C function given below

```
int f(int j)
{
static int i = 50;
int k;
if (i == j)
  {
printf("something");
k = f(i);
return 0;
}
else return 0;
}
```

Which one of the following is **TRUE**?

(A) The function returns 0 for all values of j.

(B) The function prints the string something for all values of j.

(C) The function returns 0 when j = 50.

(D) The function will exhaust the runtime stack or run into an infinite loop when j = 50.

Answer: (D)

Exp: For any value of 'j' other than 50 the function will return 0, for j=50, then condition (i==j) will be true, it will print "something" and function will be called recursively with same value till the run time stack overflows.

43. In designing a computer's cache system, the cache block (or cache line) size is an important Parameter. Which one of the following statements is correct in this context?

(A) A smaller block size implies better spatial locality

(B) A smaller block size implies a smaller cache tag and hence lower cache tag overhead

(C) A smaller block size implies a larger cache tag and hence lower cache hit time

(D) A smaller block size incurs a lower cache miss penalty

Answer: (D)

Exp: When a cache block size is smaller, it could accommodate more number of blocks, it improves the hit ratio for cache, so the miss penalty for cache will be lowered.

44. If the associativity of a processor cache is doubled while keeping the capacity and block size unchanged, which one of the following is guaranteed to be NOT affected?

(A) Width of tag comparator

(B) Width of set index decoder

(C) Width of way selection multiplexor

(D) Width of processor to main memory data bus

Answer: (D)

Exp: When associativity is doubled, then the set offset will be effected, accordingly, the number of bits used for TAG comparator be effected.

Width of set index decoder also will be effected when set offset is changed.

Width of wag selection multiplexer wil be effected when the block offset is changed.

With of processor to main memory data bus is guaranteed to be NOT effected.

45. The value of a *float* type variable is represented using the single-precision 32-bit floating point format of IEEE-754 standard that uses 1 bit for sign, 8 bits for biased exponent and 23 bits for mantissa. A *float* type variable X is assigned the decimal value of -14.25. The representation of X in hexadecimal notation is

(A) C1640000H (B) 416C0000H (C) 41640000H (D) C16C0000H

Answer: (A)

Exp: (A)

S	E	M
1 bit	8 bits	23 bits

$(14.25)_{10} = (1110.01)_2$

1110.01×2^0

$= 1.11001 \times 2^3$

$S: 1$

$E: (3+127)_{10} = (10000010)_2$

$M: 11001000-----$

Value stored:

$\underbrace{1100}_{[C}\ \underbrace{0001}_{1}\ \underbrace{0110}_{6}\ \underbrace{0100}_{4}\ 00---$

$0\ 0\ 0\ 0\ ]_H$

46. In the Newton-Raphson method, an initial guess of $x_0 = 2$ is made and the sequence $x_0, x_1, x_2 \ldots$ is obtained for the function

$$0.75x^3 - 2x^2 - 2x + 4 = 0$$

Consider the statements

(I) $x_3 = 0$.

(II) The method converges to a solution in a finite number of iterations.

Which of the following is TRUE?

(A) Only I (B) Only II (C) Both I and II (D) Neither I nor II

Answer: (A)

Exp: $f(x) = 0.75\,x^3 - 2x^2 - 2x + 4;\ f'(x) = 2.25x^2 - 4x - 2$

$x_0 = 2,\ f_0 = -2;\ f_0' = -1$

$\therefore x_1 = x_0 - \dfrac{f_0}{f_0'} = 0$

$\Rightarrow f_1 = 4;\ f_1' = -2$

$\therefore x_2 = x_1 - \dfrac{f_1}{f_1'} = 2$

$\Rightarrow f_2 = -2,\ f_2' = -1$

$\therefore x_3 = x_2 - \dfrac{f_2}{f_2'} = 0$

Also, root does not lies between 0 and 1.

So, the method diverges if $x_0 = 2$

$\therefore$ only (I) is true.

47. The product of the non-zero eigenvalues of the matrix

$$\begin{bmatrix} 1 & 0 & 0 & 0 & 1 \\ 0 & 1 & 1 & 1 & 0 \\ 0 & 1 & 1 & 1 & 0 \\ 0 & 1 & 1 & 1 & 0 \\ 1 & 0 & 0 & 0 & 1 \end{bmatrix}$$

is_______.

Answer: (6)

Exp: Let $A = \begin{pmatrix} 1 & 0 & 0 & 0 & 1 \\ 0 & 1 & 1 & 1 & 0 \\ 0 & 1 & 1 & 1 & 0 \\ 0 & 1 & 1 & 1 & 0 \\ 1 & 0 & 0 & 0 & 1 \end{pmatrix}$

Let $X = \begin{pmatrix} x_1 \\ x_2 \\ x_3 \\ x_4 \\ x_5 \end{pmatrix}$ be eigen vector

By the definition of eigen vector, $AX = \lambda X$

$$\begin{pmatrix} 1 & 0 & 0 & 0 & 1 \\ 0 & 1 & 1 & 1 & 0 \\ 0 & 1 & 1 & 1 & 0 \\ 0 & 1 & 1 & 1 & 0 \\ 1 & 0 & 0 & 0 & 1 \end{pmatrix}\begin{pmatrix} x_1 \\ x_2 \\ x_3 \\ x_4 \\ x_5 \end{pmatrix} = \lambda\begin{pmatrix} x_1 \\ x_2 \\ x_3 \\ x_4 \\ x_5 \end{pmatrix}$$

$x_1 + x_5 = \lambda x_5$

$x_2 + x_3 + x_4 = \lambda x_2$

$x_2 + x_3 + x_4 = \lambda x_3$

$x_2 + x_3 + x_4 = \lambda x_4$

$x_1 + x_5 = \lambda x_4 \Rightarrow x_1 + x_5 = \lambda x_5 = \lambda x_4$

and $x_2 + x_3 + x_4 = \lambda x_2 = \lambda x_3 = \lambda x_4$

(1) If $\lambda \neq 0$ say $x_1 = x_5 = a$

$x_2 = x_3 = x_4 = b$

$\Rightarrow x_1 + x_5 = \lambda a \Rightarrow 2a = \lambda a \Rightarrow \lambda = 2$

$x_2 + x_3 + x_4 = \lambda a \Rightarrow 3a = \lambda a \Rightarrow \lambda = 3$

(2) if $\lambda = 0 \Rightarrow$ eigen value =0

$\therefore$ Three distinct eigen values are 0,2,3 product of non zero eigen values $=2\times3=6$

48. The probability that a given positive integer lying between 1 and 100 (both inclusive) is NOT divisible by 2, 3 or 5 is _______ .

Answer: (0.259 to 0.261)

Exp: Let A = divisible by 2, B = divisible by 3 and C = divisible by 5, then

$n(A) = 50$, $n(B) = 33$, $n(C) = 20$

$n(A\cap B) = 16$, $n(B\cap C) = 6$, $n(A\cap C) = 10$

$n(A\cap B\cap C) = 3$

$P(A\cup B\cup C) = P(A)+P(B)+P(C) - P(A\cap B)-P(B\cap C)-P(A\cap C)+P(A\cap B\cap C) = 74/100$

$\therefore$ Required probability is $P\left(\overline{A} \cap \overline{B} \cap \overline{C}\right) = 1 - P\left(A \cup B \cup C\right) = 0.26.$

49. The number of distinct positive integral factors of 2014 is ___________________________

Answer: (8)

Exp: $2014 = 2\times19\times53$ i.e., product of prime factors

$\therefore$ Number of distinct positive integral factors of 2014 is $(2)\times(2)\times(2) = 8$.

50. Consider the following relation on subsets of the set S of integers between 1 and 2014. For two distinct subsets U and V of S we say $U < V$ if the minimum element in the symmetric difference of the two sets is in U.

Consider the following two statements:

S1: There is a subset of S that is larger than every other subset.
S2: There is a subset of S that is smaller than every other subset.

Which one of the following is CORRECT?

(A) Both S1 and S2 are true
(B) S1 is true and S2 is false
(C) S2 is true and S1 is false
(D) Neither S1 nor S2 is true

Answer: (A)

Exp: From given data S1 is true ,since null set is larger than every other set ,and S2 is true since the universal set $\{1,2,...,2014\}$ is smaller than every other set.

Both s1 and s2 are true.

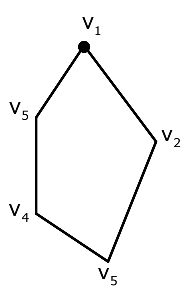
51. A cycle on *n* vertices is isomorphic to its complement. The value of *n* is _____.

Answer: (5)

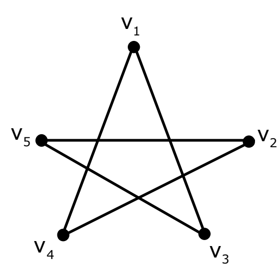
Exp: The number of edges in C_n is n where as the number of edges in $C_n^{'}$ is $n_{c_2} - n$

Cycle graph C_n and its complement $C_n^{'}$ have different number of edges if $n \neq 5$

Consider a cycle on five vertices C_5



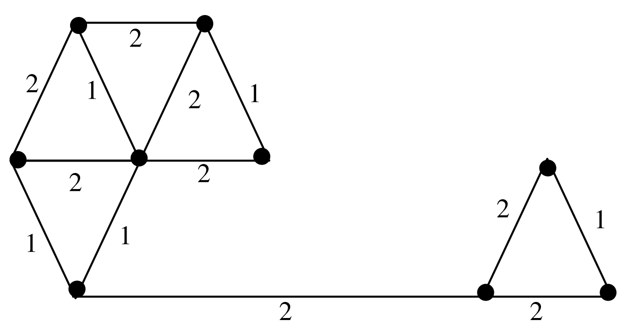
C_5



$\left(\text{complement of } C_5\right) = C_5^{'}$

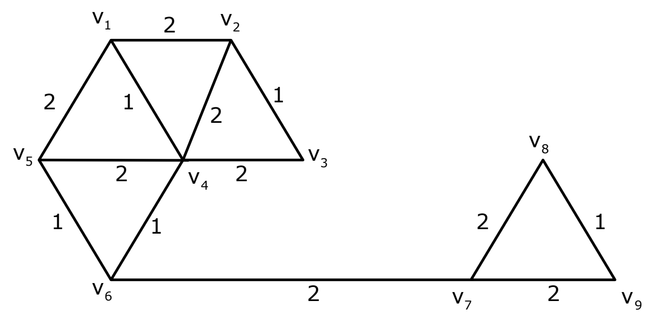
C_5 and $C_5^{'}$ are isomorphic
$\therefore n = 5$

52. The number of distinct minimum spanning trees for the weighted graph below is



Answer: (6)

Exp: Consider the connected weighted graph (Application of Kruskal's Algorithm)



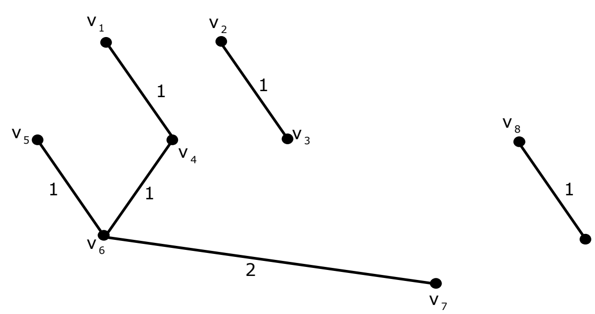
Sort the edges by increasing edges costs (weights)

$[\{v_1, v_4\}, \{v_2, v_3\}, \{v_4, v_6\}, \{v_5, v_6\}, \{v_8, v_9\} (\text{Cost} - 1)$

$[\overbrace{\{v_1, v_2\}, \{v_2, v_4\}, \{v_4, v_3\}}^{3}, \{\cancel{v_4, v_5}\}, \{\cancel{v_1, v_5}\}$

$\{\cancel{v_6, v_7}\}, \underbrace{\{v_7, v_8\}, \{v_7, v_9\}}_{2} (\text{cost} - 2)]$

Selection of edges of cost-1, will not form a cycle, so



Selection of $\{v_4, v_5\}$ and $\{v_1, v_5\}$ forms a cycle, so we will not consider the edges. The edge $\{v_6, v_7\}$ can be choosen because of connectedness.

Selection of $\{v_1, v_2\}$ and $\{v_7, v_8\}$ forms one minimum spanning tree.

Selection of $\{v_1, v_2\}$ and $\{v_7, v_9\}$ forms one minimum spanning tree.

Selection of $\{v_2, v_4\}$ and $\{v_7, v_8\}$ forms one minimum spanning tree.

Selection of $\{v_2, v_4\}$ and $\{v_7, v_9\}$ forms one minimum spanning tree.

$$\left.\begin{array}{l}\text{Selection of } \{v_3, v_4\} \text{ and } \{v_7, v_8\} \\ \text{Selection of } \{v_3, v_4\} \text{ and } \{v_7, v_9\}\end{array}\right\} \text{forms two minimum spanning trees}$$

$\therefore$ There are 6 distinct minimum spanning trees.

53 Which one of the following Boolean expressions is NOT a tautology?

$(A)\ ((a \to b) \wedge (b \to c)) \to (a \to c)$

$(B)\ (a \leftrightarrow c) \to (\sim b \to (a \wedge c))$

$(C)\ (a \wedge b \wedge c) \to (c \wedge a)$

$(D)\ a \to (b \to a)$

Answer: (B)

Exp: (D) $a \to (b \to a)(\Rightarrow \neg a \vee (b \to a))(\Rightarrow \neg a \vee (\neg b \vee a)) \Leftrightarrow T(\text{tautology})$

(C) $(a \wedge b \wedge c) \to (c \vee a) \Leftrightarrow \neg(a \wedge b \wedge c) \vee (c \vee a)$

$\Leftrightarrow (\neg a \vee \neg b \vee \neg c) \vee (c \vee a)$

$\Leftrightarrow (\neg a \vee a) \vee P\ (\text{where P is disjunction of literals})$

$\Leftrightarrow T \vee P \Rightarrow T$

(a) $\begin{array}{l} a \to b \\ \underline{b \to c} \\ \therefore a \to c \end{array}$ by hypothetical syllogism

$((a \to b) \wedge (b \to c)) \to (a \to c)$ is a tautology

Answer is B which is not tautology.

54 SQL allows duplicate tuples in relations, and correspondingly defines the multiplicity of tuples in the result of joins. Which one of the following queries always gives the same answer as the nested query shown below:

Select * from R where a in (select S. a from S)

(A) Select R. * from R, S where R. a=S. a

(B) Select distinct R. * from R,S where R. a=S. a

(C) Select R. * from R, (select distinct a from S) as S1 where R. a=S1.a

(D) Select R. * from R, S where R.a = S. a and is unique R

Answer: (C)

Exp: Consider the following instances of R & S

a	b	c
1	2	3
1	2	3
3	4	5
3	4	5

a d e

1	2	3
2	3	4
3	4	6
3	4	6

O/P of given nested query is

a	b	c
1	2	3
1	2	3
3	4	5
3	4	5

(A) O/P:- multiplicity of tuples is disturbed

a	b	c
1	2	3
1	2	3
3	4	5
3	4	5
3	4	5
3	4	5

(B) O/P:-

a	b	c
1	2	3
3	4	5

(C) O/P:-

Multiplicity of tuples is maintained

a	b	c
1	2	3
1	2	3
3	4	5
3	4	5

Multiplicity of duplicate tuples will be distributed when there is a match between R.a and S.a and for that match S.a's value is repeated.

55 Consider a main memory system that consists of 8 memory modules attached to the system bus, which is one word wide. When a write request is made, the bus is occupied for 100 nanoseconds (ns) by the data, address, and control signals. During the same 100 ns, and for 500 ns thereafter, the addressed memory module executes one cycle accepting and storing the data. The (internal) operation of different memory modules may overlap in time, but only one request can be on the bus at any time. The maximum number of stores (of one word each) that can be initiated in 1 millisecond is ____________

Answer: (10000)

Exp: Each write request, the bus is occupied for 100 n.s

Storing of data requires 100 n.s.

$$\text{In } 100 \text{ n.s} - 1 \text{ store}$$

$$\frac{100}{10^6} \text{ n.s} = 1 \text{ store}$$

$$1 \text{ m.s} = \frac{10^6}{100} \text{stores}$$

$$= 10000 \text{ stores}$$

Q. No. 1 – 5 Carry One Mark Each

1. While trying to collect an envelope from under the table, Mr. X fell down and was losing consciousness.
   (I: While trying to collect; II: from under the table; III: Mr. X fell down and; IV: was losing consciousness.)

   Which one of the above underlined parts of the sentence is NOT appropriate?

   (A) I (B) II (C) III (D) IV

Answer: (D)

2. If she ______________ how to calibrate the instrument, she ______________ done the experiment.

   (A) knows, will have
   (B) knew, had
   (C) had known, could have
   (D) should have known, would have

Answer: (C)

3. Choose the word that is opposite in meaning to the word "coherent".

   (A) sticky (B) well-connected (C) rambling (D) friendly

Answer: (C)

4. Which number does not belong in the series below?

   2, 5, 10, 17, 26, 37, 50, 64

   (A) 17 (B) 37 (C) 64 (D) 26

Answer: (C)

5. The table below has question-wise data on the performance of students in an examination. The marks for each question are also listed. There is no negative or partial marking in the examination.

Q.No	Marks	Answered Correctly	Answered Wrongly	Not Attempted
1	2	21	17	6
2	3	15	27	2
3	2	23	18	3

What is the average of the marks obtained by the class in the examination?

(A) 1.34 (B) 1.74 (C) 3.02 (D) 3.91

Answer: (C)

Exp: Total question

$44\times2=88$

$44\times3=132$

$$\frac{144}{132} = \frac{88}{308}$$

Total marks obtained= $(21\times2) + (15\times3) + (23\times2) = 133$

Total Number of students=44

$$\text{Average} = \frac{133}{44} = 3.02$$

Q. No. 6 – 10 Carry One Mark Each

6. A dance programme is scheduled for 10.00 a.m. Some students are participating in the programme and they need to come an hour earlier than the start of the event. These students should be accompanied by a parent. Other students and parents should come in time for the programme. The instruction you think that is appropriate for this is

(A) Students should come at 9.00 a.m. and parents should come at 10.00 a.m.

(B) Participating students should come at 9.00 a.m. accompanied by a parent, and other parents and students should come by 10.00 a.m.

(C) Students who are not participating should come by 10.00 a.m. and they should not bring their parents. Participating students should come at 9.00 a.m.

(D) Participating students should come before 9.00 a.m. Parents who accompany them should come at 9.00 a.m. All others should come at 10.00 a.m.

Answer: (B)

7. By the beginning of the 20th century, several hypotheses were being proposed, suggesting a paradigm shift in our understanding of the universe. However, the clinching evidence was provided by experimental measurements of the position of a star which was directly behind our sun.

Which of the following inference(s) may be drawn from the above passage?

(i) Our understanding of the universe changes based on the positions of stars

(ii) Paradigm shifts usually occur at the beginning of centuries

(iii) Stars are important objects in the universe

(iv) Experimental evidence was important in confirming this paradigm shift

(A) (i), (ii) and (iv) (B) (iii) only (C) (i) and (iv) (D) (iv) only

Answer: (D)

8. The Gross Domestic Product (GDP) in Rupees grew at 7% during 2012-2013. For international comparison, the GDP is compared in US Dollars (USD) after conversion based on the market exchange rate. During the period 2012-2013 the exchange rate for the USD increased from Rs. 50/ USD to Rs. 60/ USD. India's GDP in USD during the period 2012-2013

(A) increased by 5 % (B) decreased by 13%

(C) decreased by 20% (D) decreased by 11%

Answer: (D)

Exp: Per 100 Rs final value 107 Rs

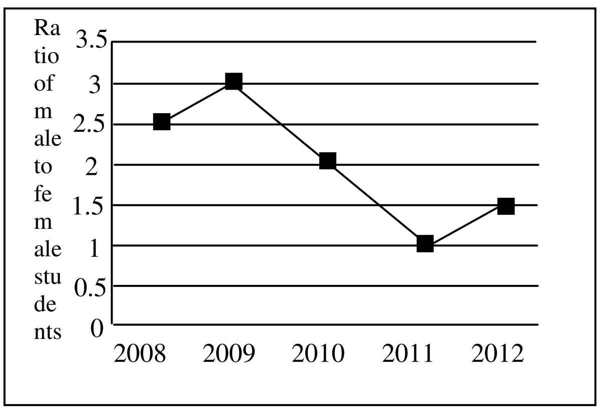
$\Rightarrow$ Per $\frac{100}{50}$ Dollars final value $\frac{107}{60}$

for 100 dollars____?

$= \frac{100\times 50}{100}\times\frac{107}{60} = 89.16$

Decreased by 11%.

9. he ratio of male to female students in a college for five years is plotted in the following line graph. If the number of female students in 2011 and 2012 is equal, what is the ratio of male students in 2012 to male students in 2011?



(A) 1:1 (B) 2:1 (C) 1.5:1 (D) 2.5:1

Answer: (C)

Exp: Take number of female students in 2011=100

$\therefore$ Number of male in 2011=100

No. of female in 2012=100

No. of male in 2012=150

$\text{Ratio} = \frac{150}{100}$ = 1.5: 1

10. Consider the equation: $(7526)_8 - (Y)_8 = (4364)_8$, where $(X)_N$ stands for X to the base N. Find Y.

(A) 1634 (B) 1737 (C) 3142 (D) 3162

Answer: (C)

Q. No. 1 – 25 Carry One Mark Each

1. Consider the following statements:

   P: Good mobile phones are not cheap

   Q: Cheap mobile phones are not good

   L: P implies Q

   M: Q implies P

   N: P is equivalent to Q

   Which one of the following about L, M, and N is **CORRECT**?

   (A) Only L is TRUE. (B) Only M is TRUE.

   (C) Only N is TRUE. (D) L, M and N are TRUE.

Answer: (D)

Exp: g : mobile is good c : mobile is cheap

P : Good mobile phones are not cheap $\cong g \to \neg c \cong (\neg g \vee \neg c)$ $[\because a \to b \equiv \neg a \vee b]$

Q : Cheap mobile phones are not good $\cong c \to \neg g \cong (\neg c \vee \neg g)$

$\therefore$ Both P and Q are equivalent which means P and Q imply each other

2. Let X and Y be finite sets and $f : X \to Y$ be a function. Which one of the following statements is TRUE?

   (A) For any subsets A and B of X, $|f(A \cup B)| = |f(A)| + |f(B)|$

   (B) For any subsets A and B of X, $f(A \cap B) = f(A) \cap f(B)$

   (C) For any subsets A and B of X, $|f(A \cap B)| = \min\{|f(A)|, |f(B)|\}$

   (D) For any subsets S and T of Y, $f^{-1}(S \cap T) = f^{-1}(S) \cap f^{-1}(T)$

Answer: (D)

Exp: $f : X \to Y$ defined by $f(a) = 1, f(b) = 1, f(c) = 2$ where

$X = \{a, b, c\}\ Y = \{1, 2\}$

Let $A = \{a, c\}, B = \{b, c\}$ be subsets of X

then $|f(A \cup B)| = 2$; $|f(A)| = 2$; $|f(B)| = 2$

$f(A \cap B) = \{2\}$; $f(A) = \{1, 2\}$; $f(B) = \{1, 2\}$

$f(A) \cap f(B) = \{1, 2\}$

$|f(A \cap B)| = 1$

$\therefore$ Options (A), (B), (C) are not true

Hence, option (D) is true

3. Let G be a group with 15 elements. Let L be a subgroup of G. It is known that $L \neq G$ and that the size of L is at least 4. The size of L is _______.

Answer: (5)

Exp: Order of subgroup divides order of group (Lagrange's theorem).

3, 5 and 15 can be the order of subgroup. As subgroup has atleast 4 elements and it is not equal to the given group, order of subgroup can't be 3 and 15. Hence it is 5.

4. Which one of the following statements is TRUE about every $n \times n$ matrix with only real eigenvalues?

(A) If the trace of the matrix is positive and the determinant of the matrix is negative, at least one of its eigenvalues is negative.

(B) If the trace of the matrix is positive, all its eigenvalues are positive.

(C) If the determinant of the matrix is positive, all its eigenvalues are positive.

(D) If the product of the trace and determinant of the matrix is positive, all its eigenvalues are positive.

Answer: (A)

Exp: If the trace of the matrix is positive and the determinant of the matrix is negative then atleast one of its eigen values is negative.

Since determinant = product of eigen values.

5. If V_1 and V_2 are 4-dimensional subspaces of a 6-dimensional vector space V, then the smallest possible dimension of $V_1 \cap V_2$ is _______.

Answer: (2)

Exp: Let the basis of 6-dimensional vector space be {e1, e2, e3,e4, e5, e6}. In order for *V1* ∩ *V2* to have smallest possible dimension V1 and V2 could be, say, {e1, e2, e3,e4} and {e3, e4, e5, e6} respectively. The basis of *V1* ∩ *V2* would then be {e3, e4}. => Smallest possible dimension = 2.

6. If $\int_0^{2\pi} |x \sin x| \; dx = k\pi$, then the value of k is equal to _______.

Answer: (4)

Exp: $$\int_0^{2\pi} |x\sin x|dx = K\pi \Rightarrow \int_0^{\pi} x\sin x\,dx + \int_{\pi}^{2\pi} -(x\sin x)dx = K\pi \left[\begin{array}{l}\because |\sin x| = -\sin x \\ \pi < x < 2\pi\end{array}\right]$$

$$\Rightarrow x(-\cos x) - 1(-\sin x)\Big|_0^{\pi} - (-x\cos x + \sin x)\Big|_{\pi}^{2\pi} = K\pi$$

$$\Rightarrow (-\pi\cos\pi + \sin\pi) - 0 - \left[(-2\pi\cos 2\pi + \sin 2\pi) - (-\pi\cos\pi + \sin\pi)\right] = K\pi$$

$$\Rightarrow \pi + 0 - \left[-2\pi + 0 - (\pi + 0)\right] = K\pi \Rightarrow 4\pi = K\pi \Rightarrow k = 4$$

7. Consider the following minterm expression for F.

$F(P,Q,R,S) = \sum 0, 2, 5, 7, 8, 10, 13, 15$

The minterms 2, 7, 8 and 13 are ‘do not care terms. The minimal sum of-products form for F is

(A) $Q\bar{S}+\bar{Q}S$

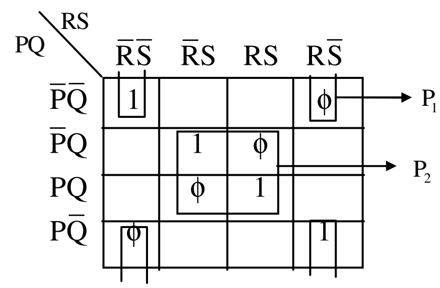
(B) $\bar{Q}\bar{S}+QS$

(C) $\bar{Q}\,\bar{R}\,\bar{S}+\bar{Q}\,R\,\bar{S}+Q\bar{R}S+QRS$

(B) $\bar{P}\bar{Q}\bar{S}+\bar{P}QS+PQS+P\bar{Q}\bar{S}$

Answer: (B)

Exp: The K-map for the function F is as follows:-



$P_1=\bar{Q}\bar{S}$ and $P_2=QS$

$\therefore F(P,Q,R,S)=P_1+P_2$

$=\bar{Q}\bar{S}+QS$

8. Consider the following combinational function block involving four Boolean variables x, y, a, b where x, a, b are inputs and y is the output.

```
f (x,  y,  a,  b)
{
    if (x  is  1) y = a;
    else y  =  b;
}
```

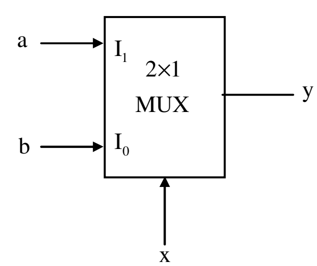
Which one of the following digital logic blocks is the most suitable for implementing this function?

(A) Full adder (B) Priority encoder (C) Multiplexor (D) Flip-flop

Answer: (C)

Exp: $y=\bar{x}b+xa$

‘x’ is working as selection line, where the two input lines are ‘a’ and ‘b’, so the function $F(x,y,a,b)$ can be implemented using (2×1) multiplexer as follows:



9. Consider the following processors (ns stands for nanoseconds). Assume that the pipeline registers have zero latency.

P1: Four-stage pipeline with stage latencies 1 ns, 2 ns, 2 ns, 1 ns.

P2: Four-stage pipeline with stage latencies 1 ns, 1.5 ns, 1.5 ns, 1.5 ns.

P3: Five-stage pipeline with stage latencies 0.5 ns, 1 ns, 1 ns, 0.6 ns, 1 ns.

P4: Five-stage pipeline with stage latencies 0.5 ns, 0.5 ns, 1 ns, 1 ns, 1.1 ns.

Which processor has the highest peak clock frequency?

(A) P1 (B) P2 (C) P3 (D) P4

Answer: (C)

Exp: Clock period (CP) = max stage delay + overhead

So $CP_{P1} = Max(1,2,2,1) = 2ns$

$CP_{P2} = Max(1, 1.5, 1.5, 1.5) = 1.5 ns$

$CP_{P3} = Max(0.5, 1,1,0.6,1) = 1ns$

$CP_{P4} = Max(0.5,0.5,1,1,1.1) = 1.1ns$

As frequency $\alpha \frac{1}{C.P}$, so least clock period will give the highest peak clock frequency.

So, $f_{p3} = \frac{1}{1ns} = 1GHz$

10. Let A be a square matrix size $n \times n$. Consider the following pseudocode. What is the expected output?

```
C = 100;
for i = 1 to n do
for j = 1 to n do
{
  Temp = A[ i ] [ j ] + C ;
  A [ i ] [ j ] = A [ j ] [ i ] ;
  A [ j ] [ i ] = Temp – C ;
}
for i = 1 to n do
 for j = 1 to n do
  output (A[ i ] [ j ]);
```

(A) The matrix A itself

(B) Transpose of the matrix A

(C) Adding 100 to the upper diagonal elements and subtracting 100 from lower diagonal elements of A

(D) None of these

Answer: (A)

Exp: In the computation of given pseudo code for each row and column of Matrix A, each upper triangular element will be interchanged by its mirror image in the lower triangular and after that the same lower triangular element will be again re-interchanged by its mirror image in the upper triangular, resulting the final computed Matrix A same as input Matrix A.

11. The minimum number of arithmetic operations required to evaluate the polynomial $P(X) = X^5 + 4X^3 + 6x + 5$ for a given value of X, using only one temporary variable is _____.

Answer: (7)

Exp: $P(x)=x^5+4x^3+6x+5$ can be re written as follows

$P(x)=x^3(x^2+4)+6x+5$

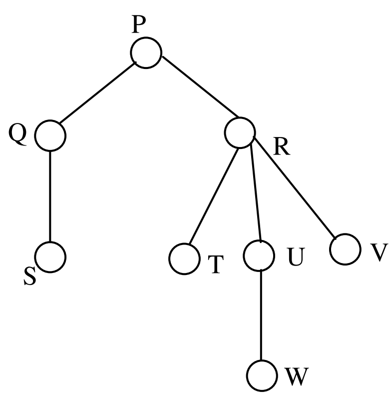
Now using only one temporary variable t and any number of data transfer as well as memory related operation the polynomial can be evaluated as follows

1. $t=x*x$ [Evaluate x^2 and store in memory]
2. $t=t+4$ [Evaluate (x^2+4) and store in memory]
3. $t=x^2$ [Retinue x^2 from memory]
4. $t=t*.X$ [Evaluate x^3 and store in memory]
5. $t=t*(x^2+4)$ [Evaluate $x^3(x^2+4)$ and store in memory]
6. $t=6*x$ [Evaluate 6x and store in memory]
7. $t=t+5$ [Evaluate $(6x+5)$ and store in memory]
8. $t=t+x^3(x^2+4)$ [Retrieve $x^2(x^2+4)$ from memory and evaluate $\{x^3(x^2+4)+6x+5\}$

In the above 8 steps of evaluation, the total number of arithmetic operations required and 7 [4 Multiplications, 3 Additions]

So answer is 7 arithmetic operations.

12. Consider the following rooted tree with the vertex labelled P as the root



The order in which the nodes are visited during an in-order traversal of the tree is

(A) SQPTRWUV (B) SQPTUWRV

(C) SQPTWUVR (D) SQPTRUWV

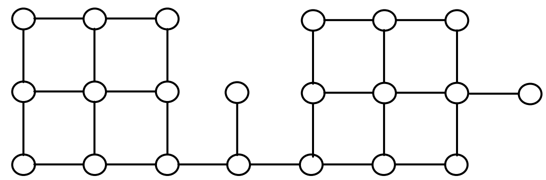
Answer: (A)

Exp: The In order Traversal of Ternary Tree is done as follows:

Left $\rightarrow$ Root $\rightarrow$ Middle $\rightarrow$ Right

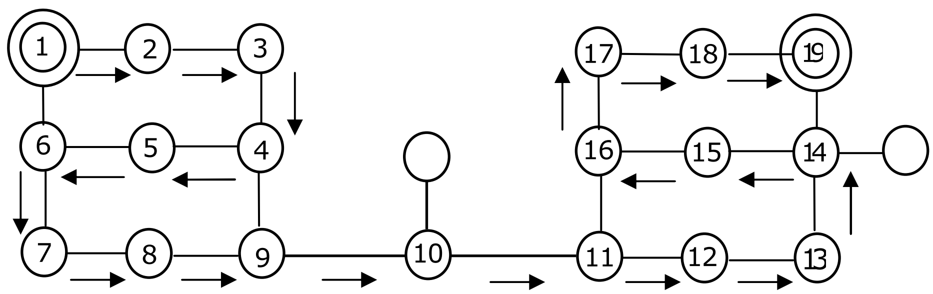
So the nodes are visited in SQPTRWUV order.

13. Suppose depth first search is executed on the graph below starting at some unknown vertex. Assume that a recursive call to visit a vertex is made only after first checking that the vertex has not been visited earlier. Then the maximum possible recursion depth (including the initial call) is _________.



Answer: 19

Exp:



Suppose, we start DFS at vertex numbered as 1 and continue calling recursive function for DFS on subsequent nodes numbered in ascending order.

The recursive calling sequence is shown as marked line in the above diagram which shows maximum possible recursion depth including the initial call is 19.

14. You have an array of n elements. Suppose you implement quick sort by always choosing the central element of the array as the pivot. Then the tightest upper bound for the worst case performance is

(A) $O(n^2)$ (B) $O(n\log n)$ (C) $\theta(n\log n)$ (D) $O(n^2)$

Answer: (A)

Exp: The Worst case time complexity of quick sort is O (n^2). This will happen when the elements of the input array are already in order (ascending or descending), irrespective of position of pivot element in array.

15. The length of the shortest string NOT in the language $\left(\text{over } \Sigma = \{a, b\}\right)$ of the following regular expression is _________. a*b* (ba)* a*

Answer: (3)

Exp: R.E= $a^*b^*(ba)^*a^*$

Length 0 is present as it accepts $\in$ all length 1 strings are present (a, b) also aa, ab, ba, bb are present, But 'bab' is not present. So it is 3

16. Let Σ be a finite non-empty alphabet and let $2\Sigma^*$ be the power set of Σ^*. Which one of the following is **TRUE**?

(A) Both $2\Sigma^*$ and Σ^* are countable

(B) $2\Sigma^*$ is countable Σ^* is uncountable

(C) $2\Sigma^*$ is uncountable and Σ^* is countable

(D) Both $2\Sigma^*$ and Σ^* are uncountable

Answer: (C)

Exp: 2^{ε^*} is the power set of ε^*

ε^* is countabily infinite.

The power set of countabily infinite set is uncountable.

So 2^{ε^*} is uncountable, and ε^* is countable.

17. One of the purposes of using intermediate code in compilers is to

(A) make parsing and semantic analysis simpler.

(B) improve error recovery and error reporting

(C) increase the chances of reusing the machine-independent code optimizer in other compliers.

(D) improve the register allocation.

Answer: (C)

Exp: Intermediate code is machine independent code which makes it easy to retarget the compiler to generate code for newer and different processors.

18. Which of the following statements are CORRECT?

1) Static allocation of all data areas by a compiler makes it impossible to implement recursion.

2) Automatic garbage collection is essential to implement recursion.

3) Dynamic allocation of activation records is essential to implement recursion.

4) Both heap and stack are essential to implement recursion.

(A) 1 and 2 only (B) 2 and 3 only (C) 3 and 4 only (D) 1 and 3 only

Answer: (D)

Exp: To implement recursion, activation record should be implemented by providing dynamic memory allocation. This dynamic allocation is done from runtime stack. Heap is essential to allocate memory for data structures at run-time, not for recursion.

So statement 1 and 3 are correction.

19. In the context of modular software design, which one of the following combinations is desirable?

(A) High cohesion and high coupling (B) High cohesion and low coupling

(C) Low cohesion and high coupling (D) Low cohesion and low coupling

Answer: (B)

Exp: Cohesion is a measure of internal strength within a module, whereas coupling is a measure of inter dependency among the modules. So in the context of modular software design there should be high cohesion and low coupling.

20. A system uses 3 page frames for storing process pages in main memory. It uses the Least Recently Used (LRU) page replacement policy. Assume that all the page frames are initially empty. What is the total number of page faults that will occur while processing the page reference string given below?

4, 7, 6, 1, 7, 6, 1, 2, 7, 2

Answer: (6)

Exp: Page reference string is
4, 7, 6, 1, 7, 6, 1, 2, 7, 2
Implementing LRU using 3 page frames
Total page faults = 6

$\cancel{4}$ 1
$\cancel{2}$ 2
$\cancel{6}$ 7

21. What is the optimized version of the relation algebra expression $\pi_{A1}(\pi_{A2}(\sigma_{F1}(r)))$,, where A1, A2 are sets of attributes in with $A_1 \subset A_2$ and F1, F2 are Boolean expressions based on the attributes in r?

(A) $\pi_{A_1}(\sigma(F1 \wedge F2)(r))$
(B) $\pi_{A_1}(\sigma(F1 \vee F2)(r))$
(C) $\pi_{A_2}(\sigma(F1 \wedge F2)(r))$
(D) $\pi_{A2}(\sigma(F1 \vee F2)(r))$

Answer: (A)

Exp: π is used to select a subset of attributes and σ_p is used to select subset of tuples matching the predicate P.

$$\Pi_{A_1}\left(\Pi_{A_2}\left(\sigma_{F_1}\left(\sigma_{F_2}(r)\right)\right)\right) = \Pi_{A_1}\left(\Pi_{A_2}\left(\sigma(F_1 \wedge F_2)(r)\right)\right)$$

and as $A_1 \subset A_2$, so final relation will be displaying values for attributes present in set A.

$$\Pi_{A_1}\left(\Pi_{A_2}\left(\sigma(F_1 \wedge F_2)(r)\right)\right) = \Pi_{A_1}\left(\sigma(F_1 \wedge F_2)(r)\right)$$

22. A prime attribute of a relation scheme R is an attribute that appears

(A) in all candidate keys of R.
(B) in some candidate key of R.
(C) in a foreign keys of R.
(D) only in the primary key of R.

Answer: (B)

Exp: A prime attribute or key attribute of a relation scheme R is an attribute that appears in any of the candidate key of R, remaining attributes are known as non-prime or non-key tribute

23. In the following pairs of OSI protocol layer/sub-layer and its functionality, the **INCORRECT** pair is

(A) Network layer and Routing
(B) Data Link Layer and Bit synchronization
(C) Transport layer and End-to-end process communication
(D) Medium Access Control sub-layer and Channel sharing

Answer: (B)

Exp: (a) One of the main functionality of Network Layer is Routing. So Option (a) is CORRECT.

(b) Bit Synchronization is always handled by Physical Layer of OSI model but not Data Link Layer. So

Option (b) is INCORRECT.

(c) End – to – End Process Communication is handled by Transport Layer. So Option (c) is CORRECT.

(d) MAC sub layer have 3 types of protocols (Random, Controlled and Channelized Access).

24. A bit-stuffing based framing protocol uses an 8-bit delimiter pattern of 01111110. If the output bit-string after stuffing is 01111100101, then the input bit-string is

(A) 0111110100 (B) 0111110101

(C) 0111111101 (D) 0111111111

Answer: (B)

Exp: Given 8 – bit delimiter pattern of 01111110.

Output Bit string after stuffing is $011111\underline{0}0101$

$\Downarrow$

StuffedBit

Now, Input String is 0111110101

25. Host A (on TCP/IP v4 network A) sends an IP datagram D to host B (also on TCP/IP V4 network B). Assume that no error occurred during the transmission of D. When D reaches B, which of the following IP header field(s) may be different from that of the original datagram D?

(i) TTL (ii) Checksum (iii) Fragment Offset

(A) (i) only (B) (i) and (ii) only

(C) (ii) and (iii) only (D) (i), (ii) and (iii)

Answer: (D)

Exp: While an IP Datagram is transferring from one host to another host, TTL, Checksum and Fragmentation Offset will be changed.

Q. No. 26 – 55 Carry Two Marks Each

26. An IP router implementing Classless Inter-domain routing (CIDR) receives a packet with address 131.23.151.76. The router's routing table has the following entries:

Prefix	Output Interface Identifier
131.16.00/12	3
131.28.0.0/14	5
131.19.0.0/16	2
131.22.0.0/15	1

The identifier of the output interface on which this packet will be forwarded is _____.

Answer: (1)

Exp: Given address 131.23.151.76.coming to the first field of given routing table

$\Rightarrow$ 131.16.0.0/12

131.0001 0111.151.76

131.0001 0000.0.0 ($\because$ given mask bits = 12)

$\Rightarrow$ 131.16.0.0 Matched

Coming to the 2nd field of given Routing table

$\Rightarrow$ 131.28.0.0/14

131.0001 0111.151.76

131.0001 0100.0.0 ($\because$ given mask bits = 14)

$\Rightarrow$ 131.20.0.0 Not matched.

Coming to the 3rd field of given Routing table

Error! Not a valid link. 131.19.0.0/16

131.0001 0111.151.76

131.0001 0111.0.0 ($\because$ given mask bits = 16)

$\Rightarrow$ 131.23.0.0 Not matched

Coming to the 4th field of given Routing table

$\Rightarrow$ 131.22.0.0/15

131.0001 0111.151.76

131.0001 0110.0.0 ($\because$ given mask bits = 15)

$\Rightarrow$ 131.22.0.0 Matched

We are getting 1st and 4th entries are matched so among them we have to picked up the longest mask bit , so output interface identifier is 1.

27. Every host in an IPv4 network has a 1-second resolution real-time clock with battery backup. Each host needs to generate up to 1000 unique identifiers per second. Assume that each host has a globally unique IPv4 address. Design a 50-bit globally unique ID for this purpose. After what period (in seconds) will the identifiers generated by a host wrap around?

Answer: (256)

Exp: Given that each host has a globally unique IPv4 Address and we have to design 50 – bit unique Id. So, 50 – bit in the sense (32 + 18). So, It is clearly showing that IP Address (32 – bit) followed by 18 bits.

1000 unique Ids => 1Sec

2^{18} unique Ids => 2^{18} / 1000 = 2^{8} = 256

28. An IP router with a Maximum Transmission Unit (MTU) of 1500 bytes has received an IP packet of size 4404 bytes with an IP header of length 20 bytes. The values of the relevant fields in the header of the third IP fragment generated by the router for this packet are

(A) MF bit: 0, Datagram Length: 1444; Offset: 370

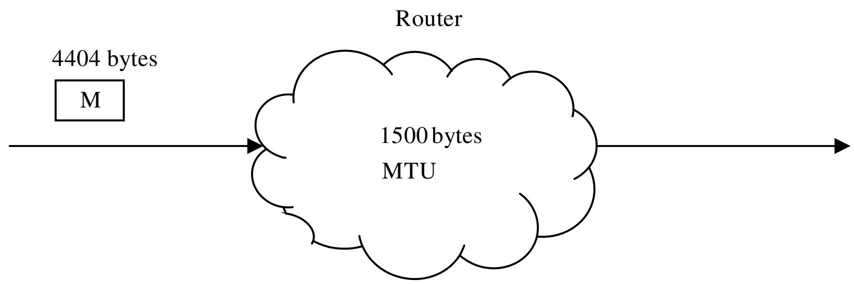
(B) MF bit: 1, Datagram Length: 1424; Offset: 185

(C) MF bit: 1, Datagram Length: 1500; Offset: 370

(D) MF bit: 0, Datagram Length: 1424; Offset: 2960

Answer: (A)

Exp:



DataLength	1480	1480	1444
	+	+	
HeaderLength	20	20	
MF	1	1	0

29. Consider the transactions T1, T2, and T3 and the schedules S1 and S2 given below.

T1 : r1 (X) ; r1 (z) ; w1 (X) ; w1 (z)

T2 : r2 (X) ; r2 (z) ; w2 (z)

T3 : r3 (X) ; r3 (X) ; w3 (Y)

S1: r1(X); r3(Y); r3(X); r2(Y); r2(Z); w3(Y); w2(Z); r1(Z); w1(X); w1(Z)

S2: r1(X); r3(Y); r2(Y); r3(X); r1(Z); r2(Z); w3(Y); w1(X); w2(Z); w1(Z)

Which one of the following statements about the schedules is **TRUE**?

(A) Only S1 is conflict-serializable.

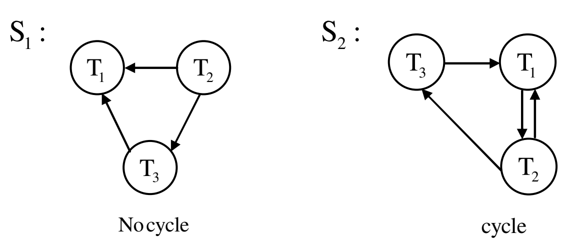
(B) Only S2 is conflict-serializable.

(C) Both S1 and S2 are conflict-serializable.

(D) Neither S1 nor S2 is conflict-serializable.

Ans: (A)

Exp: Precedence graph for S_1 & S_2 are as follows



$\therefore$ Only S_1 is conflict serializable.

30. Consider the relational schema given below, where eId of the relation dependentis a foreign key referring to empId of the relation employee. Assume that every employee has at least one associated dependent in the dependent relation.

employee $\left(\underline{empId}, empName, empAge\right)$

dependent $(\underline{depId, eId}, depName, depAge)$

Consider the following relational algebra query

$$\Pi_{empId}\,(employee) - \Pi_{empId}\,(employee \rhd\!\lhd (empId = eID) \wedge (empAge \le depAge) dependent)$$

The above query evaluates to the set of empIds of employees whose age is greater than that of

(A) some dependent. (B) all dependents.

(C) some of his/her dependents. (D) all of his/her dependents

Answer: (D)

Exp:

$$\underbrace{\prod_{empId}(employee) - \overbrace{\prod_{empId}\left(employee \bowtie_{(empId = eID) \wedge (empAge \le depAge)} dependent\right)}^{A}}_{B}$$

Part A of the above given relational algebra query will give the set of empIds of those employees whose age is less than or equal to the age of some of his/her dependents.

Now when set of empIds of all employees minus set of empIds obtained from part A is done, then we get the set of empIds of employees whose age is greater than that of all of his/her dependents.

31. A system contains three programs and each requires three tape units for its operation. The minimum number of tape units which the system must have such that deadlocks never arise is __________.

Answer: (7)

Exp:

	Maximum	Allocate	Need	Available
P_1	-3	2	1	1
P_2	-3	2	1	
P_3	-3	2	1	

With the above given data, after allocating 2 units of tape to each process, with 1 available unit any of the 3 process can be satisfied in such a way, that No dead lock will be there.

So answer is 7 tape units.

Q.32 An operating system uses *shortest remaining time first* scheduling algorithm for pre-emptive scheduling of processes. Consider the following set of processes with their arrival times and CPU burst times (in milliseconds):

Process	Arrival Time	Burst Time
P1	0	12
P2	2	4
P3	3	6
P4	8	5

The average waiting time (in milliseconds) of the processes is __________.

Answer: (5.5)

Exp: The Gantt chart for SRTF scheduling algorithm is as follows:

P_1	P_2	P_3	P_4	P_1

0 2 6 12 17 27

$$\text{Average waiting time} = \frac{15+0+3+4}{4} = \frac{22}{4} = 5.5$$

33. Consider a paging hardware with a TLB. Assume that the entire page table and all the pages are in the physical memory. It takes 10 milliseconds to search the TLB and 80 milliseconds to access the physical memory. If the TLB hit ratio is 0.6, the effective memory access time (in milliseconds) is __________.

Answer: (122)

Exp: $T_{ave} = H_1 \times (T_{TLB} + T_M) + (1 - H_1) \times (T_{TLB} + 2 \times T_M)$

T_{TLB} = time to search in TLB = 10ms

T_M=time to access physical memory = 30ms

H_1 = TLB hit ratio = 0.6

$T_{ave} = 0.6 \times (10+80) + (1-0.6)(10+2\times 80)$

$T_{ave} = 0.6 \times 90\,\text{ms} + 0.4(170)\,\text{ms}$

$T_{ave} = 54\,\text{ms} + 68\,\text{ms} = 122\,\text{ms}$

34. Consider the basic block given below.

$a = b + c$

$c = a + d$

$d = b + c$

$e = d - b$

$a = e + b$

The minimum number of nodes and edges present in the DAG representation of the above basic block respectively are

(A) 6 and 6 (B) 8 and 10 (C) 9 and 12 (D) 4 and 4

Answer: (A)

Exp:

The given basic block can be rewritten as

$$\begin{array}{lcl} a = b + c & & a = b + c \\ c = a + d & & c = b + c + d \\ d = b + c & \Rightarrow & d = b + b + c + d = 2b + c + d \\ e = d - b & & e = \cancel{b} + b + c + d - \cancel{b} = b + c + d \\ a = e + b & & a = b + b + c + d = 2b + c + d \end{array}$$

From above simplification it is visible that e is same as c and final value of a is same as d. So the final basic block can be written as follows:

$a = b + c$

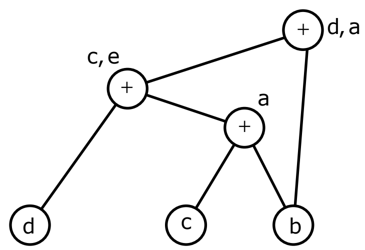
$c = a + d$

$d = 2b + c + d$

$e = c$

$a = d$

The DAG generated for the above basic block in as



Maximum number of modes and edges in above DAG is $(6,6)$

35. Which one of the following problems is undecidable?

(A) Deciding if a given context-free grammar is ambiguous.

(B) Deciding if a given string is generated by a given context-free grammar.

(C) Deciding if the language generated by a given context-free grammar is empty.

(D) Deciding if the language generated by a given context-free grammar is finite.

Answer: (A)

Exp: There were algorithms to find the membership of CFG (using CYK algorithm) and finiteness of CFG (using CNF graph) and emptiness. But there is no algorithm for ambiguity of CFG, so it is undecidable.

36. Consider the following languages over the alphabet $\Sigma = \{0,1,c\}$

$L_1 = \{0^n 1^n \mid n \geq 0\}$

$L_2 = \{wcw^r \mid w \in \{0,1\}^*\}$

$L_3 = \{ww^r \mid w \in \{0,1\}^*\}$

Here w^r is the reverse of the string w. Which of these languages are deterministic Context-free languages?

(A) None of the languages

(B) Only L_1

(C) Only L_1 and L_2

(D) All the three languages

Answer: (C)

Exp: For the languages L_1 and L_2 we can have deterministic push down automata, so they are DCFL's, but for L_3 only non-deterministic PDA possible. So the language L_3 is not a deterministic CFL.

37. Suppose you want to move from 0 to 100 on the number line. In each step, you either move right by a unit distance or you take a shortcut. A shortcut is simply a pre-specified pair of integers i,j with

$i < j$. Given a shortcut i, j if you are at position i on the number line, you may directly move to j. Suppose T(k) denotes the smallest number of steps needed to move from k to 100. suppose further that there is at most 1 shortcut involving any number, and in particular from 9 there is a shortcut to 15. Let y and z be such that T(9) = 1 + min(T(y), T(z)). Then the value of the product yz is_______.

Answer: (150)

Exp: By definition, T(9) = Dist. From 9 to 100

As given, T(9) = 1+min (T(y), T()z) = 1+min (Dist. from y to 100, Dist. From z to 100)

$\Rightarrow$1=Dist. from 9 to y/Dist. From 9 to z

$\Rightarrow$ There are only two such values-one is the simple one step on number line i.e. 10, and the other is the shortcut associated with 9 i.e. 15.

$\Rightarrow$ Therefore, y and z are 10 and 15 (in any order)

$\Rightarrow$ Product yz = 150. Answer

38. Consider the decision problem 2CNFSAT defined as follows:

$\{\ \phi \mid \phi$ is a satisfiable propositional formula in CNF with at most two literal per clause$\}$

For example, $\phi = (x_1 \vee x_2) \wedge (x_1 \vee \overline{x_3}) \wedge (x_2 \vee x_4)$ is a Boolean formula and it is in 2CNFSAT.

The decision problem 2CNFSAT is

(A) NP-Complete.

(B) solvable in polynomial time by reduction to directed graph reachability.

(C) solvable in constant time since any input instance is satisfiable.

(D) NP-hard, but not NP-complete.

Answer: (B)

Exp: 2 SAT is in P. This we can prove by reducing 2 SAT to directed graph reachability problem which is known to be in P.

Procedure for reducing 2 SAT to reachability problem:

1. Let φ be CNF with clauses of length 2 and let P be the set of propositional variables(literals) in φ
2. Build a graph G=(V,E) with $V = P \cup \{\neg p \mid p \in P\}$ and $(x, y) \in E$ iff there is a clause in φ that is equivalent to $x \to y$ (all the clauses are converted to equivalent implications and the graph built is called as implication graph)
3. Observe that φ is unsatisfiable iff there is a $p \in P$ such that there is both a path from p to to $\neg p$ and from $\neg p$ to p in G.

   This condition can be tested by running the reachability algorithm several times.

39. Suppose we have a balanced binary search tree T holding n numbers. We are given two numbers L and H and wish to sum up all the numbers in T that lie between L and H. Suppose there are m such numbers in T. If the tightest upper bound on the time to compute the sum is $O(n^a \log^b n + m^c \log^d n)$, the value of a + 10b + 100c + 1000d is _______.

Answer: (110)

Exp: It takes (log n) time to determine numbers n_1 and n_2 in balanced binary search tree T such that

1. n_1 is the smallest number greater than or equal to L and there is no predecessor n'_1 of n_1 such that n'_1 is equal to n_1.
2. n_2 is the largest number less than or equal to H and there is no successor of n'_2 of n_2 such that is equal to n_2.

Since there are m elements between n_1 and n_2, it takes 'm' time to add all elements between n_1 and n_2.

So time complexity is O (log n + m)

So the given expression becomes O (n^o log' n + m' $\log^o$ n)

And a+ 10b+ 100c+1000d = 0 + 10*1 + 100*1 + 1000*1 = 10 + 100 = 110

Because a = 0, b = 1, c = 1 and d =0

40. Consider a hash table with 100 slots. Collisions are resolved using chaining. Assuming simple uniform hashing, what is the probability that the first 3 slots are unfilled after the first 3 insertions?

(A) $(97 \times 97 \times 97)/100^3$

(B) $(99 \times 98 \times 97)/100^3$

(C) $(97 \times 96 \times 95)/100^3$

(D) $(97 \times 96 \times 95)/(3! \times 100^3)$

Answer: (A)

Exp:**A**

P(First insertion in such a way that first 3 slots are unfilled) $= \frac{97C_1}{100C_1} = \frac{97}{100}$

B

P(second insertion in such a way that first 3 slots are unfilled) $= \frac{97C_1}{100C_1} = \frac{97}{100}$ [$\because$ chaining is used to resolve collision, so second insertion can be done at same index as first index]

C

P(Third insertion in such a way that first 3 slots are unfilled) $= \frac{97C_1}{100C_1} = \frac{97}{100}$ [$\because$ Third insertion can be done at same index as first or second index]

So Total prob. $P(A) \times P(B) \times P(C)$

$$= \frac{97}{100} \times \frac{97}{100} \times \frac{97}{100} = \frac{(97 \times 97 \times 97)}{100^3}$$

41. Consider the pseudocode given below. The function Dosomething () takes as argument a pointer to the root of an arbitrary tree represented by the leftMostChild-rightSibling representation. Each node of the tree is of type treeNode.

```
typedef struct treeNode* treeptr;
Struct treeNode
{
    Treeptr leftMostchild, rightSibiling;
};
Int Dosomething (treeptr tree)
{
    int value =0;
    if (tree ! = NULL)   {
      If  (tree -> leftMostchild = = NULL)
else
    value = Dosomething (tree->leftMostchild);
value = value + Dosometing (tree->rightsibiling);
}
return (value);
}
```

When the pointer to the root of a tree is passed as the argument to **DoSomething**, the value returned by the function corresponds to the

(A) number of internal nodes in the tree.

(B) height of the tree.

(C) number of nodes without a right sibling in the tree.

(D) number of leaf nodes in the tree.

Answer: (D)

Exp: The key to solving such questions is to understand or detect where/by what condition the value (or the counter) is getting incremented each time.

Here, that condition is if (tree→leftMostchild == Null)

⇒ Which means if there is no left most child of the tree (or the sub-tree or the current node-as called in recursion)

⇒ Which means there is no child to that particular node (since if there is no left most child, there is no child at all).

⇒ Which means the node under consideration is a leaf node.

⇒ The function recursively counts, and adds to value, whenever a leaf node is encountered.

⇒ The function returns the number of leaf nodes in the tree.

42. Consider the C function given below. Assume that the array listA contains n (> 0) elements, sored in ascending order.

```
int ProcessArray (int * listA, int x, int n)
```

```
{
 Int 1, j, k;
i = 0;
j = n – 1;
do {
    k = (i + j) /2;
  if (x < = listA [k])
      j = k – 1;
If (listA [k] < = x)
    i = k+1;
}while (1 < = j);
If (listA [k] = = x)
    return (k) ;
else
   return -1;
}
```

Which one of the following statements about the function **ProcessArray is CORRECT**?

(A) It will run into an infinite loop when x is not in listA.

(B) It is an implementation of binary search

(C) It will always find the maximum element in listA.

(D) It will return – 1 even when x is present in listA.

Answer: (B)

Exp: By the logic of the algorithm it is clear that it is an attempted implementation of Binary Search. So option C is clearly eliminated. Let us now check for options A and D.

A good way to do this is to create small dummy examples (arrays) and implement the algorithm as it is. One may make any array of choice. Running iterations of the algorithm would indicate that the loop exits when the x is not present. So option A is wrong. Also, when x is present, the correct index is indeed returned. D is also wrong. Correct answer is B. It is a correct implementation of Binary Search.

43. An instruction pipeline has five stages, namely, instruction fetch (IF), instruction decode and register fetch (ID/RF), instruction execution (EX), memory access (MEM), and register write back (WB) with stage latencies 1 ns, 2.2 ns, 2 ns, 1 ns, and 0.75 ns, respectively (ns stands for nanoseconds). To gain in terms of frequency, the designers have decided to split the ID/RF stage into three stages (ID, RF1, RF2) each of latency 2.2/3 ns. Also, the EX stage is split into two stages (EX1, EX2) each of latency 1 ns. The new design has a total of eight pipeline stages. A program has 20% branch instructions which execute in the EX stage and produce the next instruction pointer at the end of the EX stage in the old design and at the end of the EX2 stage in the new design. The IF stage stalls after fetching a branch instruction until the next instruction pointer is computed. All instructions other than the branch instruction have an average CPI of one in both the designs. The execution times of this program on the old and the new design are *P* and *Q* nanoseconds, respectively. The value of *P*/*Q* is __________

Answer: (1.54)

Exp:

	No. of stages	Stall cycle	Stall frequency	Clock period	Avg. access time
Old design	5	2	20%	2.2ns	P
New design	8	5	20%	1 ns	Q

$$P = \left[80\%(1\text{clock}) + 20\%\left(\underset{\text{completion}}{1} + \underset{\text{stall clock}}{2}\right)\right] \times T_{c-p}$$

$$P = (.8 + .6) \times 2.2\,\text{ns} = 3.08\,\text{ns}$$

$$Q = \left[80\%(1\text{clock}) + 20\%\left(\underset{\text{completion}}{1} + \underset{\text{stall clock}}{5}\right)\right] \times T_{c-p}$$

$$P = (.8 + .12) \times 1\text{ns} = 2\,\text{ns}$$

So the value of $\frac{P}{Q} = \frac{3.08\text{ns}}{2\,\text{ns}} = 1.54$

44. The memory access time is 1 nanosecond for a read operation with a hit in cache, 5 nanoseconds for a read operation with a miss in cache, 2 nanoseconds for a write operation with a hit in cache and 10 nanoseconds for a write operation with a miss in cache. Execution of a sequence of instructions involves 100 instruction fetch operations, 60 memory operand read operations and 40 memory operand write operations. The cache hit-ratio is 0.9. The average memory access time (in nanoseconds) in executing the sequence of instructions is ___________.

Answer: (1.68)

Exp: $\text{Total instruction} = \begin{matrix}\text{100 instruction}\\ \text{fetch operation}\end{matrix} + \begin{matrix}\text{60 memory}\\ \text{operand read}\\ \text{operation}\end{matrix} + \begin{matrix}\text{40 memory}\\ \text{operand write op}\end{matrix}$

$= 200 \text{ instructions (operations)}$

Time taken for fetching 100 instructions (equivalent to read)

$= 90 * 1\,\text{ns} + 10 * 5\text{ns} = 140\,\text{ns}$

Memory operand Read operations $= 90\%(60) * 1\,\text{ns} + 10\%(60) \times 5\,\text{ns}$

$= 54\,\text{ns} + 30\,\text{ns} = 84\,\text{ms}$

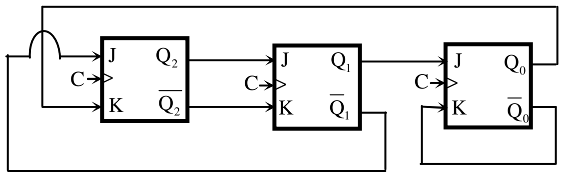
Memory operands write operation time $= 90\%(40) * 2\,\text{ns} + 10\%(40) * 10\,\text{ns}$

$= 72\,\text{ns} + 40\,\text{ns} = 112\,\text{ns}$

Total time taken for executing 200 instructions $= 140 + 84 + 112 = 336\,\text{ns}$

$\therefore$ Average memory access time $= \frac{336\text{ ns}}{200} = 1.68\,\text{ns}$

45.



The above synchronous sequential circuit built using JK flip-flops is initialized with $Q_2Q_1Q_0 = 000$. The state sequence for this circuit for the next 3 clock cycles is

(A) 001, 010, 011 (B) 111, 110, 101

(C) 100, 110, 111 (D) 100, 011, 001

Answer: (C)

Exp:

P.S.			FF inputs						N.S.		
Q_2	Q_1	Q_0	J_2	K_2	J_1	K_1	J_0	K_0	Q_2^+	Q_1^+	Q_0^+
			$(\bar{Q}_1)$	(Q_0)	(Q_2)	$(\bar{Q}_2)$	(Q_1)	$(\bar{Q}_0)$			
0	0	0	1	0	0	1	0	1	1	0	0
1	0	0	1	0	1	0	0	1	1	1	0
1	1	0	0	0	1	0	1	1	1	1	1

46. With respect to the numerical evaluation of the definite integral, $K = \int_a^b x^2 dx$, where a and b are given, which of the following statements is/are TRUE?

(I) The value of K obtained using the trapezoidal rule is always greater than or equal to the exact value of the definite integral.

(II) The value of K obtained using the Simpson's rule is always equal to the exact value of the definite integral.

(A) I only (B) II only (C) Both I and II (D) Neither I nor II

Answer: (C)

Exp: $\int_a^b x^2\, dx$

let $a = 0,\ b = 1$

let $n = 4$

$\Rightarrow h = \dfrac{b-a}{n} = \dfrac{1-0}{4} = 0.25$

x	0	0.25	0.5	0.75	1
$y = x^2$	0	0.625	0.25	0.5625	1
	y_0	y_1	y_2	y_3	y_4

I. By Trapezoidal rule

$$\int_0^1 x^2\,dx = \frac{h}{2}\left[(y_0+y_4)+2(y_1+y_2+y_3)\right]$$

$$= \frac{0.25}{2}\left[(0+1)+2(0.0625+0.25+0.5625)\right] = 0.34375$$

II. By Simpson's $\frac{1}{3}$ rule

$$\int_0^1 x^2 dx = \frac{h}{3}\left[(y_0+y_4)+2(y_2)+4(y_1+y_3)\right]$$

$$= \frac{0.25}{3}\left[(0+1)+2(0.25)+4(0.0625+0.5625)\right] = \frac{1}{3}$$

Exact value $\int_0^1 x^2\,dx = \left.\frac{x^3}{3}\right|_0^1 = \frac{1}{3}$

47. The value of the integral given below is

$$\int_0^\pi x^2 \cos x\,dx$$

(A) -2π (B) π (C) $-\pi$ (D) 2π

Answer: (A)

Exp: $\int_0^\pi x^2 \cos x\,dx = x^2(\sin x) - 2x(-\cos x) + 2(-\sin x)\Big|_0^\pi$

$$= \left(\pi^2 \sin\pi + 2\pi\cos\pi - 2\sin\pi\right) - (0+0+0) = -2\pi$$

48. Let S be a sample space and two mutually exclusive events A and B be such that $A \cup B = S$. If $P(.)$ denotes the probability of the event, the maximum value of P(A)P(B) is ______

Answer: (0.25)

Exp: Given

$A \cup B = S$

$\Rightarrow P(A \cup B) = P(S) = 1$

$\Rightarrow P(A) + P(B) = 1$ ($\because$ A & B are mutually exclusive)

$\Rightarrow P(B) = 1 - P(A)$

Maximum value of $P(A)P(B) = ?$

Maximum value of P (A) [1- P (A)] =?

Let $P(A) = X$

Let $f(x) = x(1-x) = x - x^2$

$$\text{for } f(x) \text{ maximum} \Rightarrow f'(x)=0 \Rightarrow 1-2x=0 \Rightarrow x=\frac{1}{2}$$

$$f''(x)=-2;\quad f''\left(\frac{1}{2}\right)<0$$

$\therefore f(x)$ has maximum

At $x=\frac{1}{2}$ and maximum value

$$=f\left(\frac{1}{2}\right)=\frac{1}{2}\left(1-\frac{1}{2}\right)=\frac{1}{2}.\frac{1}{2}=\frac{1}{4}=0.25$$

49. Consider the set of all functions $f:\{0,1,...,2014\}\to\{0,1...,2014\}$ such that $f(f(i))=i$, for $0\le i\le 2014$. Consider the following statements.

P. For each such function it must be the case that for every i, f(i) = i,

Q. For each such function it must be the case that for some i,f(i) = i,

R. Each such function must be onto.

Which one of the following is CORRECT?

(A) P, Q and R are true
(B) Only Q and R are true
(C) Only P and Q are true
(D) Only R is true

Answer: (B)

Exp: Let us consider a function (counter example) as

$f(0)=1, f(1)=0, f(2)=3, f(3)=2, \ldots\ldots, f(2012)=2013,$

$f(2013)=2012$ and $f(2014)=2014$

Clearly $f(f(i))=i$ for $0\le i\le 2014$

Here $f(i)\ne i$ for every i and $f(i)=i$ for some i

Also f is onto

Hence, only Q and R are true

50. There are two elements x,y in a group (G,*) such that every element in the group can be written as a product of some number of x's and y's in some order. It is known that

$$x*x=y*y=x*y*x*y=y*x*y*x=e$$

where e is the identity element. The maximum number of elements in such a group is ________________.

Answer: (4)

Exp: $x\times x=e \quad \Rightarrow x$ is its own inverse

$y \times y = e \quad \Rightarrow$ y is its own inverse

$(x \times y) \times (x \times y) = e \Rightarrow (x \times y)$ is its own inverse

$(y \times x) \times (y \times x) = e \Rightarrow (y \times x)$ is its own inverse

also $x \times x \times e = e \times e$ can be rewritten as follows

$x \times y \times y \times x = e \times y \times y \times e = e [\because y \times y = e]$

$(x \times y) \times (y \times x) = e$ shows that $(x \times y)$ and $(y \times x)$

Are each other's inverse and we already know that

$(x \times y)$ and $(y \times x)$ are inverse of its own.

As per $(G, *)$ to be group any element should have

only one inverse element (unique)

This process $x \times y = y \times x$ (is one element)

So the elements of such group are 4 which are $\{x, y, e, x \times y\}$

51. If G is a forest with *n* vertices and *k* connected components, how many edges does *G* have?

(A) $\lfloor n/k \rfloor$ (B) $\lceil n/k \rceil$ (C) $n - k$ (D) $n - k + 1$

Answer: (C)

Exp: Let $n_1, n_2, \ldots, n_k$ be the number of vertices respectively in K connected components of a forest G, then $n_1 - 1, n_2 - 1, \ldots, n_k - 1$ be the number of edges respectively in K connected components and $n_1 + n_2 + \ldots + n_k = n$ (number of vertices in G)

Hence, number of edges in G = number of edges in K connected components

$= (n_1 - 1) + (n_2 - 1) + \ldots + (n_k - 1) = n - k$

52. Let δ denote the minimum degree of a vertex in a graph. For all planar graphs on n vertices with $\delta \geq 3$, which one of the following is **TRUE**?

(A) In any planar embedding, the number of faces is at least $\frac{n}{2} + 2$

(B) In any planar embedding, the number of faces is less than $\frac{n}{2} + 2$

(C) There is a planar embedding in which the number of faces is less than $\frac{n}{2} + 2$

(D) There is a planar embedding in which the number of faces is at most $\frac{n}{\delta + 1}$

Answer: (A)

Exp: We know that $v+r=e+2 \Rightarrow e=n+r-2 \quad ...(1)$

Where $V=n(\text{number of vertices}); r=\text{number of faces and}$

$e=\text{number of edges}$

Given, $\delta \geq 3$ then $3n \leq 2e$

$$\Rightarrow e \geq \frac{3n}{2}$$

$$\Rightarrow n+r-2 \geq \frac{3n}{2} (\text{using}(1))$$

$$\Rightarrow r \geq \frac{3n}{2} - n + 2 \Rightarrow r \geq \frac{n}{2} + 2$$

$\therefore$ Number of faces is atleast $\frac{n}{2}+2$

53. The CORECT formula for the sentence, "not all rainy days are cold" is

(A) $\forall d\ (\text{Rainy}(d) \wedge \sim \text{Cold}(d))$

(B) $\forall d\ (\sim \text{Rainy}(d) \rightarrow \text{Cold}(d))$

(C) $\exists d\ (\sim \text{Rainy}(d) \rightarrow \text{Cold}(d))$

(D) $\exists d\ (\text{Rainy}(d) \wedge \sim \text{Cold}(d))$

Answer: (D)

Exp: Given statement is $\sim \forall d[r(d) \rightarrow c(d)]$

$$\equiv \sim \forall d[\sim r(d) \vee c(d)]$$
$$\equiv \exists d[r(d) \wedge \sim c(d)]$$

(Since $p \rightarrow q \equiv \sim p \vee q$ and let r(d) be rainy day, c(d) be cold day)

54. Consider the following relational schema:

Employee (<u>empId</u>, empName, empDept)

Customer (<u>custId</u>, custName, salesRepId, rating)

SalesRepId is a foreign key referring to empId of the employee relation. Assume that each employee makes a sale to at least one customer. What does the following query return?

```
SELECT empName
FROM employee E
WHERE NOT EXISTS (SELECT custId
                  FROM customer C
                  WHERE C. salesRepId = E. empId
                  AND C. rating < > 'GOOD')
```

(A) Names of all the employees with at least one of their customers having a 'GOOD' rating.

(B) Names of all the employees with at most one of their customers having a 'GOOD' rating.

(C) Names of all the employees with none of their customers having a 'GOOD' rating.

(D) Names of all the employees with all their customers having a 'GOOD' rating.

Answer: (D)

Exp: The outer query will return the value (names of employees) for a tuple in relation E, only if inner query for that tuple will return no tuple (usage of NOT EXISTS).

The inner query will run for every tuple of outer query. It selects cust-id for an employee e, if rating of customer is NOT good. Such an employee should not be selected in the output of outer query.

So the query will return the names of all those employees whose all customers have GOOD rating.

55. Let $\oplus$ denote the Exclusive OR (XOR) operation. Let '1' and '0' denote the binary constants. Consider the following Boolean expression for F over two variables P and Q.

$$F(P,Q) = ((1 \oplus P) \oplus (P \oplus Q)) \oplus ((P \oplus Q) \oplus (Q \oplus 0))$$

The equivalent expression for F is

(A) $P + Q$ (B) $\overline{P + Q}$ (C) $P \oplus Q$ (D) $\overline{P \oplus Q}$

Answer: (D)

Exp:
$$F(P,Q) = ((1 \oplus P) \oplus (P \oplus Q)) \oplus ((P \oplus Q) \oplus (Q \oplus 0))$$
$$= \left(\bar{P} \oplus \left(P\bar{Q} + \bar{P}Q\right)\right) \oplus \left(\left(P\bar{Q} + \bar{P}Q\right) \oplus Q\right)$$
$$= \left[\bar{P}\left(PQ + \bar{P}\,\bar{Q}\right) + P\left(P\bar{Q} + \bar{P}Q\right)\right] \oplus \left[\left(PQ + \bar{P}\bar{Q}\right)Q + \left(P\bar{Q} + \bar{P}Q\right)\bar{Q}\right]$$
$$= \left(\bar{P}\bar{Q} + P\bar{Q}\right) \oplus \left(PQ + P\bar{Q}\right) \qquad = \bar{Q} \oplus P \qquad = PQ + \bar{P}\bar{Q} = \overline{P \oplus Q}$$

Q. No. 1 – 25 Carry One Mark Each

1. Consider an undirected random graph of eight vertices. The probability that there is an edge between a pair of vertices is ½. What is the expected number of unordered cycles of length three?

(A) 1/8 (B) 1 (C) 7 (D) 8

Answer:-(C)

Exp:- $P(\text{edge}) = \frac{1}{2}$

Number of ways we can choose the vertices out of 8 is 8_{c_3}

(Three edges in each cycle)

Expected number of unordered cycles of length 3 $= 8_{C_3} \times \left(\frac{1}{2}\right)^3 = 7$

2. Which of the following statements is/are **TRUE** for undirected graphs?

P: Number of odd degree vertices is even.

Q: Sum of degrees of all vertices is even.

(A) P only (B) Q only

(C) Both P and Q (D) Neither P nor Q

Answer:- (C)

Exp:- Q: Sum of degrees of all vertices $= 2 \times (\text{number of edges})$

3. Function f is known at the following points:

x	0	0.3	0.6	0.9	1.2	1.5	1.8	2.1	2.4	2.7	3.0
f(x)	0	0.09	0.36	0.81	1.44	2.25	3.24	4.41	5.76	7.29	9.00

The value of $\int_0^3 f(x)\,dx$ computed using the trapezoidal rule is

(A) 8.983 (B) 9.003 (C) 9.017 (D) 9.045

Answer:- (D)

Exp:- $\int_0^3 f(x)\,dx = \frac{h}{2}\left[f(x_0) + f(x_{10}) + 2\left(f(x_1) + f(x_2) + \ldots + f(x_9)\right)\right]$

$= \frac{0.3}{2}\left[9.00 + 2(25.65)\right] = 9.045$

4. Which one of the following functions is continuous at x = 3 ?

(A) $f(x)=\begin{cases} 2, \text{ if } x=3 \\ x-1, \text{ if } x>3 \\ \dfrac{x+3}{3}, \text{ if } x<3 \end{cases}$

(B) $f(x)=\begin{cases} 4, & \text{if } x=3 \\ 8-x & \text{if } x\neq 3 \end{cases}$

(C) $f(x)=\begin{cases} x+3, & \text{if } x\leq 3 \\ x-4 & \text{if } x>3 \end{cases}$

(D) $f(x)=\dfrac{1}{x^3-27}, \quad \text{if } x\neq 3$

Answer:-(A)

Exp:- $\lim\limits_{x\to 3+} f(x)=\lim\limits_{x\to 3+}(x-1)=2=f(3)$

$\lim\limits_{x\to 3-} f(x)=\lim\limits_{x\to 3-}\left(\dfrac{x+3}{3}\right)=2=f(3)$

$\therefore f(x)$ is continuous at $x=3$

5. Which one of the following expressions does **NOT** represent exclusive NOR of x and y?

(A) $xy+x'y'$ (B) $x\oplus y'$ (C) $x'\oplus y$ (D) $x'\oplus y'$

Answer: -(D)

Exp:- (A) $x\odot y=xy+\overline{x}\,\overline{y}$

(B) $x\oplus \overline{y}=x\overline{\overline{y}}+\overline{x}\,\overline{y}=xy+\overline{x}\,\overline{y}=x\odot y$

(C) $\overline{x}\oplus y=\left(\overline{x}\right)\overline{y}+\overline{\overline{x}}\,y=\overline{x}\,\overline{y}+xy=x\odot y$

(D) $\overline{x}\oplus\overline{y}=\left(\overline{x}\right)y+x\overline{y}=x\oplus y$

6. In a k-way set associative cache, the cache is divided into v sets, each of which consists of k lines. The lines of a set are placed in sequence one after another. The lines in set s are sequenced before the lines in set (s+1). The main memory blocks are numbered 0 onwards. The main memory block numbered j must be mapped to any one of the cache lines from

(A) $(j \bmod v)*k$ to $(j \bmod v)*k+(k-1)$

(B) $(j \bmod v)$ to $(j \bmod v)+(k-1)$

(C) $(j \bmod k)$ to $(j \bmod k)+(v-1)$

(D) $(j \bmod k)*v$ to $(j \bmod k)*v+(v-1)$

Answer: -(A)

Exp:- Position of main memory block in the cache (set) = (main memory block number) MOD (number of sets in the cache).

As the lines in the set are placed in sequence, we can have the lines from 0 to (K – 1) in each set.

Number of sets = v, main memory block number = j

First line of cache = (j mod v)*k; last line of cache = (j mod v)*k + (k – 1)

7. What is the time complexity of Bellman-Ford single-source shortest path algorithm on a complete graph of n vertices?

(A) $\Theta(n^2)$ (B) $\Theta(n^2 \log n)$ (C) $\Theta(n^3)$ (D) $\Theta(n^3 \log n)$

Answer:-(C)

Exp:- Bellman-ford time complexity: $\Theta(|V| \times |E|)$

For complete graph: $|E| = \frac{n(n-1)}{2}$

$|V| = n$

$\therefore \Theta\left(n \times \frac{n(n-1)}{2}\right) = \Theta(n^3)$

8. Which of the following statements are **TRUE**?

(1) The problem of determining whether there exists a cycle in an undirected graph is in P.

(2) The problem of determining whether there exists a cycle in an undirected graph is in NP.

(3) If a problem A is NP-Complete, there exists a non-deterministic polynomial time algorithm to solve A.

(A) 1,2 and 3 (B) 1 and 2 only (C) 2 and 3 only (D) 1 and 3 only

Answer: -(A)

Exp:- 1. Cycle detection using DFS: $O(V+E) = O(V^2)$ and it is polynomial problem

2. Every P-problem is NP$\left(\text{since } P \subset NP\right)$

3. $NP - \text{complete} \in NP$

Hence, NP-complete can be solved in non-deterministic polynomial time

9. Which of the following statements is/are **FALSE**?

(1) For every non-deterministic Turing machine, there exists an equivalent deterministic Turing machine.

(2) Turing recognizable languages are closed under union and complementation.

(3) Turing decidable languages are closed under intersection and complementation

(4) Turing recognizable languages are closed under union and intersection.

(A) 1 and 4 only (B) 1 and 3 only (C) 2 only (D) 3 only

Answer: -(C)

Exp:- (1) NTM $\cong$ DTM

(2) RELs are closed under union & but not complementation

(3) Turing decidable languages are recursive and recursive languages are closed under intersection and complementation

(4) RELs are closed under union & intersection but not under complementation

10. Three concurrent processes X, Y, and Z execute three different code segments that access and update certain shared variables. Process X executes the P operation (i.e., wait) on semaphores a, b and c; process Y executes the P operation on semaphores b, c and d; process Z executes the P operation on semaphores c, d, and a before entering the respective code segments. After completing the execution of its code segment, each process invokes the V operation (i.e., signal) on its three semaphores. All semaphores are binary semaphores initialized to one. Which one of the following represents a deadlock-free order of invoking the P operations by the processes?

(A) $X: P(a)P(b)P(c) \quad Y: P(b)P(c)P(d) \quad Z: P(c)P(d)P(a)$

(B) $X: P(b)P(a)P(c) \quad Y: P(b)P(c)P(d) \quad Z: P(a)P(c)P(d)$

(C) $X: P(b)P(a)P(c) \quad Y: P(c)P(b)P(d) \quad Z: P(a)P(c)P(d)$

(D) $X: P(a)P(b)P(c) \quad Y: P(c)P(b)P(d) \quad Z: P(c)P(d)P(a)$

Answer:-(B)

Exp:- Suppose X performs P(b) and preempts, Y gets chance, but cannot do its first wait i.e., P(b), so waits for X, now Z gets the chance and performs P(a) and preempts, next X gets chance. X cannot continue as wait on ‘a’ is done by Z already, so X waits for Z. At this time Z can continue its operations as down on c and d. Once Z finishes, X can do its operations and so Y. In any of execution order of X, Y, Z one process can continue and finish, such that waiting is not circular. In options (A),(C) and (D) we can easily find circular wait, thus deadlock

11. An index is clustered, if

(A) it is on a set of fields that form a candidate key

(B) it is on a set of fields that include the primary key

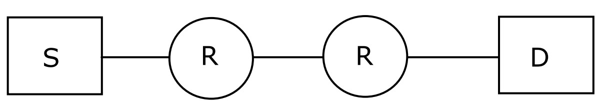
(C) the data records of the file are organized in the same order as the data entries of the index

(D) the data records of the file are organized not in the same order as the data entries of the index

Answer:-(C)

Exp:- Clustered index is built on ordering non key field and hence if the index is clustered then the data records of the file are organized in the same order as the data entries of the index.

12. Assume that source S and destination D are connected through two intermediate routers labeled R. Determine how many times each packet has to visit the network layer and the data link layer during a transmission from S to D.



(A) Network layer – 4 times and Data link layer-4 times

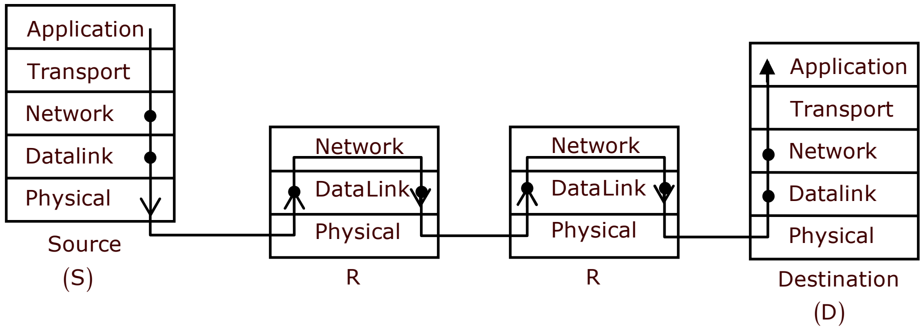
(B) Network layer – 4 times and Data link layer-3 times

(C) Network layer – 4 times and Data link layer-6 times

(D) Network layer – 2 times and Data link layer-6 times

Answer:-(C)

Exp:-



From above given diagram, its early visible that packet will visit network layer 4 times, once at each node [S, R, R, D] and packet will visit Data Link layer 6 times. One time at S and one time at D, then two times for each intermediate router R as data link layer is used for link to link communication.

Once at packet reaches R and goes up from physical –DL-Network and second time when packet coming out of router in order Network – DL- Physical

13. The transport layer protocols used for real time multimedia, file transfer, DNS and email, respectively are

(A) TCP, UDP, UDP and TCP
(B) UDP, TCP, TCP and UDP
(C) UDP, TCP, UDP and TCP
(D) TCP, UDP, TCP and UDP

Answer:- (C)

Exp:- Real time multimedia needs connectionless service, so under lying transport layer protocol used is UDP

File transfer rums over TCP protocol with port no-21

DNS runs over UDP protocol within port no-53

Email needs SMTP protocol which runs over TCP protocol within port no – 25

14. Using public key cryptography, X adds a digital signature σ to message M, encrypts <M, σ>, and sends it to Y, where it is decrypted. Which one of the following sequences of keys is used for the operations?

(A) Encryption: X's private key followed by Y's private key; Decryption: X's public key followed by Y's public key

(B) Encryption: X's private key followed by Y's public key; Decryption: X's public key followed by Y's private key

(C) Encryption: X's public key followed by Y's private key; Decryption: Y's public key followed by X's private key

(D) Encryption: X's private key followed by Y's public key; Decryption: Y's private key followed by X's public key

Answer:-(D)

Exp:-

$$\text{X} \longrightarrow \text{Y}$$

X – public
X – private

Y – public
Y – private

$$\text{Encryption}\begin{cases}\text{Source has to encrypt with its private key for}\\ \text{forming Digital signature for Authentication.}\\ \text{source has to encrypt the } \langle M, \sigma\rangle \text{ with Y's}\\ \text{public key to send it confidentially}\end{cases}$$

$$\text{Decryption}\begin{cases}\text{Destination Y has to decrypt first}\\ \text{with its private key, then decrypt}\\ \text{using source public key}\end{cases}$$

15. Match the problem domains in **Group I** with the solution technologies in **Group II**.

Group I	**Group II**
(p) Services oriented computing	(1) Interoperability
(q) Heterogeneous communicating systems	(2) BPMN
(R) Information representation	(3) Publish-find bind
(S) Process description	(4) XML

(A) P – 1, Q – 2, R – 3, S – 4
(B) P – 3, Q – 4, R – 2, S – 1
(C) P – 3, Q – 1, R – 4, S – 2
(D) P – 4, Q – 3, R – 2, S – 1

Answer:-(C)

16. A scheduling algorithm assigns priority proportional to the waiting time of a process. Every process starts with priority zero(the lowest priority). The scheduler re-evaluates the process priorities every T time units and decides the next process to schedule. Which one of the following is TRUE if the processes have no I/O operations and all arrive at time zero?

(A) This algorithm is equivalent to the first-come-first-serve algorithm

(B) This algorithm is equivalent to the round-robin algorithm

(C) This algorithm is equivalent to the shortest-job-first algorithm

(D) This algorithm is equivalent to the shortest-remaining-time-first algorithm

Answer:-(B)

Exp:- The given scheduling definition takes two parameters, one is dynamically assigned process priority and the other is 'T' time unit to re-evaluate the process priorities.

This dynamically assigned priority will be deciding processes order in ready queue of round robin algorithm whose time quantum is same as 'T' time units. As all the processes are arriving at the same time, they will be given same priority but soon after first 'T' time burst remaining processes will get higher priorities

17. What is the maximum number of reduce moves that can be taken by a bottom-up parser for a grammar with no epsilon- and unit-production $(\text{i.e., of type } A \to \in \text{ and } A \to a)$ to parse a string with n tokens?

(A) n/2 (B) n-1 (C) 2n-1 (D) 2^n

Answer: -(B)

Exp:- To have maximum number of reduce moves, all the productions will be of the type $A \to \alpha\beta$ (where α and β could be terminals or non-terminals). Consider the following illustration then:

$$\left.\begin{array}{l} \text{Input String}: a_1\, a_2\, a_3 \ldots\ldots\ldots a_{n-2}\, \underbrace{a_{n-1} a_n} \\ \qquad\qquad\qquad\qquad\qquad\quad \uparrow \\ \qquad\qquad a_1 a_2 a_3 \ldots\ldots\ldots\ldots a\, \underbrace{_{n-2} A} \\ \qquad\qquad\qquad\qquad\qquad \uparrow \\ \qquad\qquad a_1 a_2 a_3 \ldots\ldots\ldots\ldots\ldots\ldots A \\ \qquad\qquad\qquad\qquad \vdots \\ \qquad\qquad \underbrace{a_1\, a_2}_{A} \end{array}\right\} n-1 \text{ moves}$$

18. Consider the languages $L_1 = \Phi$ and $L_2 = \{a\}$. Which one of the following represents $L_1 L_2^* \cup L_1^*$?

(A) $\{\in\}$ (B) Φ (C) a^* (D) $\{\varepsilon, a\}$

Answer: -(A)

Exp:- Concatenation of empty language with any language will give the empty language and $L_1{}^* = \Phi^* = \in$. Hence $L_1 L_2^* \cup L_1^* = \{\in\}$

19. Which one of the following is the tightest upper bound that represents the time complexity of inserting an object into a binary search tree of n nodes?

(A) O(1) (B) O(log n) (C) O(n) (D) O(n log n)

Answer:-(C)

Exp:- For skewed binary search tree on n nodes, the tightest upper bound to insert a node is O(n)

20. Which one of the following is the tightest upper bound that represents the number of swaps required to sort n numbers using selection sort?

(A) O(log n) (B) O(n) (C) O(n log n) (D) $O(n^2)$

Answer:-(B)

Exp:- The maximum number of swaps that takes place in selection sort on n numbers is n

21. In the following truth table, V = 1 if and only if the input is valid.

Inputs				Outputs		
D_0	D_1	D_2	D_3	X_0	X_1	V
0	0	0	0	X	X	0
1	0	0	0	0	0	1
X	1	0	0	0	1	1
X	X	1	0	1	0	1
X	X	X	1	1	1	1

What function does the truth table represent?

(A) Priority encoder (B) Decoder

(C) Multiplexer (D) Demultiplexer

Answer: -(A)

Exp:- 4 to 2 priority encoder.

22. The smallest integer than can be represented by an 8-bit number in 2's complement form is

(A) -256 (B) -128 (C) -127 (D) 0

Answer: -(B)

Exp:- $-2^{8-1} = -128$. Range is $-2^{(n-1)}$ to $+2^{(n-1)}-1$

23. Which one of the following does **NOT** equal $\begin{vmatrix} 1 & x & x^2 \\ 1 & y & y^2 \\ 1 & z & z^2 \end{vmatrix}$?

(A) $\begin{vmatrix} 1 & x(x+1) & x+1 \\ 1 & y(y+1) & y+1 \\ 1 & z(z+1) & z+1 \end{vmatrix}$ (B) $\begin{vmatrix} 1 & x+1 & x^2+1 \\ 1 & y+1 & y^2+1 \\ 1 & z+1 & z^2+1 \end{vmatrix}$

(C) $\begin{vmatrix} 0 & x-y & x^2-y^2 \\ 0 & y-z & y^2-z^2 \\ 1 & z & z^2 \end{vmatrix}$ (D) $\begin{vmatrix} 2 & x+y & x^2+y^2 \\ 2 & y+z & y^2+z^2 \\ 1 & z & z^2 \end{vmatrix}$

Answer:- (A)

Exp:- If matrix B is obtained from matrix A by replacing the 1^{th} row by itself plus k times the m^{th} row, for $1 \neq m$ then det(B)=det(A). With this property given matrix is equal to the matrices given in options (B),(C) and (D).

24. Suppose p is number of cars per minute passing through a certain road junction between 5 PM and 6PM, and p has a Poisson distribution with mean 3. What is the probability of observing fewer than 3 cars during any given minute in this interval?

(A) $8/(2e^3)$ (B) $9/(2e^3)$ (C) $17/(2e^3)$ (D) $26/(2e^3)$

Answer:-(C)

Exp:- $P(p<3)=P(p=0)+P(p=1)+P(p=2)$

$$=\frac{e^{-\lambda}\lambda^0}{0!}+\frac{e^{-\lambda}\lambda^1}{1!}+\frac{e^{-\lambda}\lambda^2}{2!}\ (\text{where } \lambda=3)$$

$$=e^{-3}+e^{-3}\times 3+\frac{e^{-3}\times 9}{2}$$

$$=e^{-3}\left(1+3+\frac{9}{2}\right)=\frac{17}{2e^3}$$

25. A binary operation $\oplus$ on a set of integers is defined as $x\oplus y=x^2+y^2$. Which one of the following statements is **TRUE** about $\oplus$?

(A) Commutative but not associative

(B) Both commutative and associative

(C) Associative but not commutative

(D) Neither commutative nor associative

Answer:- (A)

Exp:- $x\oplus y=x^2+y^2=y^2+x^2=y\oplus x$

$\therefore$ commutative

Not associative, since, for example

$(1\oplus 2)\oplus 3\neq 1\oplus(2\oplus 3)$

Q. No. 26 – 51 Carry Two Marks Each

26. Which one of the following is **NOT** logically equivalent to $\neg\exists x(\forall y(\alpha)\wedge\forall z(\beta))$?

(A) $\forall x(\exists z(\neg\beta)\rightarrow\forall y(\alpha))$

(B) $\forall x(\forall z(\beta)\rightarrow\exists y(\neg\alpha))$

(C) $\forall x(\forall y(\alpha)\rightarrow\exists z(\neg\beta))$

(D) $\forall x(\exists y(\neg\alpha)\rightarrow\exists z(\neg\beta))$

Answer: -(A) and (D) [marks to all]

Exp:- $\neg\exists x(\forall y(\alpha)\wedge\forall z(\beta))$

$\equiv\forall x[\forall y(\alpha)\rightarrow\exists z(\neg\beta)]$ option "C" $[\because\neg(p\wedge q)\equiv p\Rightarrow\neg q]$

$\equiv\forall x[\forall z(\beta)\rightarrow\exists y(\neg\alpha)]$ option "B" $[\because p\Rightarrow q\equiv\neg q\Rightarrow\neg p]$

27. A RAM chip has a capacity of 1024 words of 8 bits each $(1K\times 8)$. The number of 2×4 decoders with enable line needed to construct a $16K\times 16$ RAM from $1K\times 8$ RAM is

(A) 4 (B) 5 (C) 6 (D) 7

Answer: -(B)

Exp:- RAM chip size = $1k\times8[1024 \text{ words of } 8 \text{ bits each}]$

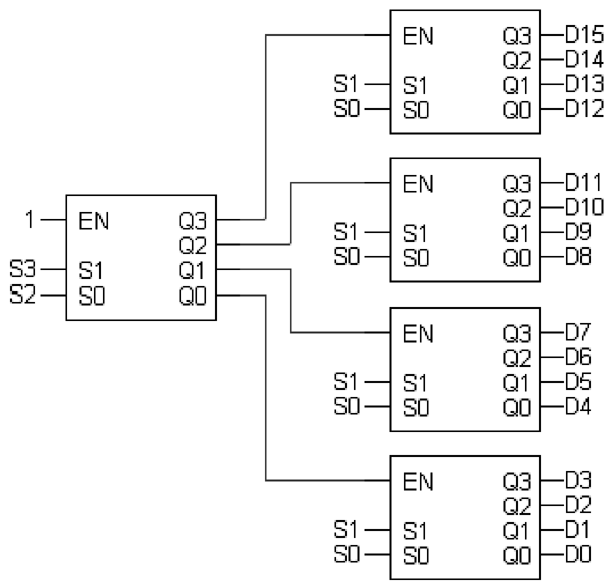
RAM to construct $=16k\times16$

Number of chips required = $\frac{16k\times16}{1k\times8}=16\times2$ [16 chips vertically with each having 2 chips horizontally]

So to select one chip out of 16 vertical chips, we need 4 x 16 decoder.

Available decoder is – 2 x 4 decoder

To be constructed is 4 x 16 decoder



So we need 5, 2 x 4 decoder in total to construct 4 x 16 decoder.

28. Consider an instruction pipeline with five stages without any branch prediction: Fetch Instruction (FI), Decode Instruction (DI), Fetch Operand (FO), Execute Instruction (EI) and Write Operand (WO). The stage delays for FI, DI, FO, EI and WO are 5 ns, 7 ns, 10 ns, 8 ns and 6 ns, respectively. There are intermediate storage buffers after each stage and the delay of each buffer is 1 ns. A program consisting of 12 instructions $I_1, I_2, I_3, ...I_{12}$ is executed in this pipelined processor. Instruction I_4 is the only branch instruction and its branch target is I_9. If the branch is taken during the execution of this program, the time (in ns) needed to complete the program is

(A) 132 (B) 165 (C) 176 (D) 328

Answer: - (B)

Exp:- Clock period=Maximum stage delay+ overhead (Buffer) =10+1=11 ns

Assume FI-1, DI-2, FO-3, EI-4, WO-5

$$
\begin{array}{lllllllllllllllll}
I_1: & 1 & 2 & 3 & 4 & 5 \\
I_2: & - & 1 & 2 & 3 & 4 & 5 \\
I_3: & - & - & 1 & 2 & 3 & 4 & 5 \\
I_4: & - & - & - & 1 & 2 & 3 & 4 & 5 \\
I_5: & - & - & - & - & 1 & 2 & 3 & 4 & 5 \\
I_6: & - & - & - & - & - & 1 & 2 & 3 & 4 & 5 \\
I_7: & - & - & - & - & - & - & 1 & 2 & 3 & 4 & 5 \\
I_8: & - & - & - & - & - & - & - & 1 & 2 & 3 & 4 & 5 \\
I_9: & - & - & - & - & - & - & - & - & 1 & 2 & 3 & 4 & 5 \\
I_{10}: & - & - & - & - & - & - & - & - & - & 1 & 2 & 3 & 4 & 5 \\
I_{11} & - & - & - & - & - & - & - & - & - & - & 1 & 2 & 3 & 4 & 5 \\
I_{12} & - & - & - & - & - & - & - & - & - & - & - & 1 & 2 & 3 & 4 & 5
\end{array}
$$

So number of clocks required to complete the program is = 15 clocks and time taken is = 15 ×11 ns=165 ns.

29. Consider the following operation along with Enqueue and Dequeue operations on queues, where k is a global parameter

```
MultiDequeue(Q) {
    m = k
    while (Q is not empty) and (m > 0) {
        Dequeue (Q)
        m = m − 1
    }
}
```

What is the worst case time complexity of a sequence of n queue operations on an initially empty queue?

(A) $\Theta(n)$ (B) $\Theta(n+k)$ (C) $\Theta(nk)$ (D) $\Theta(n^2)$

Answer:- (A)

Exp:- Initially the queue is empty and we have to perform n operations.

i) One option is to perform all Enqueue operations i.e. n Enqueue operations. Complexity will be $\theta(n)$

or

ii) We can perform a mix of Enqueue and Dequeue operations. It can be Enqueue for first n/2 times and then Dequeue for next n/2, or Enqueue and Dequeue alternately, or any permutation of Enqueues and Dequeues totaling 'n' times. Complexity will be $\theta(n)$

or

iii) We can perform Enqueues and MultiDequeues. A general pattern could be as follows:

Enqueue Enqueue … (ktimes) MultiDequeue Enqueue Enqueue … (ktimes) MultiDequeue … Up to total n

---- k items enqueued -----k items deleted----k items enqueued----k items deleted -- and so on.

The number of times this k-Enqueues, MutiDequeue cycle is performed = $n/_{k+1}$

So, Complexity will be k times Enqueue + 1 MultiDequeue) $\times$ $n/_{k+1}$

Which is $\theta\left(2k \times n/_{k+1}\right) = \theta(n)$

or

iv) We can just perform n MultiDequeues (or n Dequeues for that matter):

Each time the while condition is false (empty queue), condition is checked just once for each of the 'n' operations. So θ(n).

30. The preorder traversal sequence of a binary search tree is 30, 20, 10, 15, 25, 23, 39, 35, 42. Which one of the following is the postorder traversal sequence of the same tree?

(A) 10,20,15,23,25,35,42,39,30

(B) 15,10,25,23,20,42,35,39,30

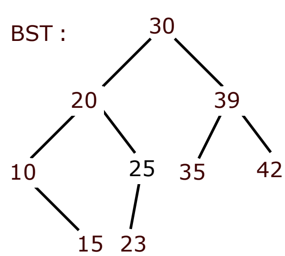
(C) 15,20,10,23,25,42,35,39,30

(D) 15,10,23,25,20,35,42,39,30

Answer:-(D)

Exp:- Preorder : 30,20,10,15,25,23,39,35,42

Inorder : 10,15,20,23,25,30,35,39,42



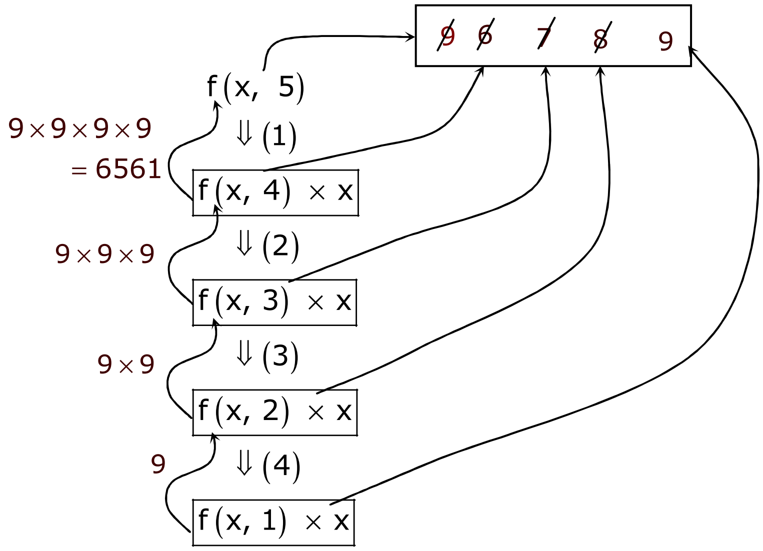
31. What is the return value of $f(p,p)$ if the value of p is initialized to 5 before the call? Note that the first parameter is passed by reference, whereas the second parameter is passed by value.

```
int f (int & x, int c) {
   c = c - 1;
   if (c == 0) return 1;
   x = x + 1;
   return f (x,c) * x;
}
```

(A) 3024 (B) 6561 (C) 55440 (D) 161051

Answer:-(B)

Exp:-



32. Which of the following is/are undecidable?

1. G is a CFG. Is $L(G) = \Phi$?
2. G is a CFG. IS $L(G) = \Sigma^*$?
3. M is a Turning machine. Is L(M) regular?
4. A is a DFA and N is a NFA. Is $L(A) = L(N)$?

(A) 3 only (B) 3 and 4 only (C) 1, 2 and 3 only (D) 2 and 3 only

Answer: -(D)

Exp:- There is an algorithm to check whether the given CFG is empty, finite or infinite and also to convert NFA to DFA hence 1 and 4 are decidable

33. Consider the following two sets of LR(1) items of an LR(1) grammar

$$
\begin{array}{ll}
X \to c.X, c/d & X \to c.X, \$ \\
X \to .cX, c/d & X \to .cX, \$ \\
X \to .d, c/d & X \to .d, \$
\end{array}
$$

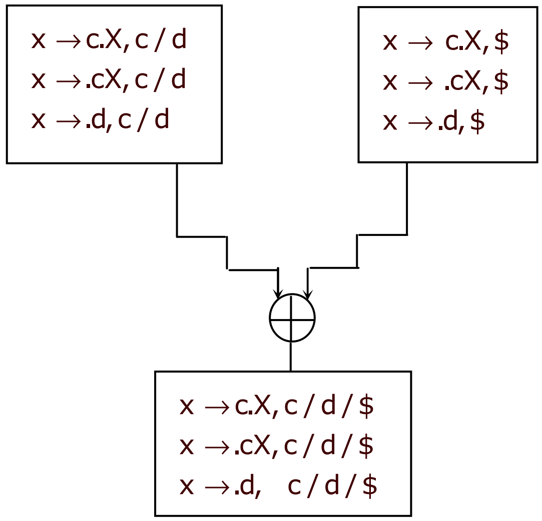
Which of the following statements related to merging of the two sets in the corresponding LALR parser is/are **FALSE**?

1. Cannot be merged since look aheads are different
2. Can be merged but will result in S–R conflict
3. Can be merged but will result in R–R conflict
4. Cannot be merged since goto on c will lead to two different sets

(A) 1 only (B) 2 only (C) 1 and 4 only (D) 1, 2, 3 and 4

Answer:-(D)

Exp:-



1. Merging of two states depends on core part (production rule with dot operator), not on look aheads.
2. The two states are not containing Reduce item ,So after merging, the merged state can not contain any S-R conflict
3. As there is no Reduce item in any of the state, so can't have R-R conflict.
4. Merging of stats does not depend on further goto on any terminal.

   So all statements are false.

34. A certain computation generates two arrays a and b such that $a[i] = f(i)$ for $0 \le i < n$ and $b[i] = g(a[i])$ for $0 \le i < n$. Suppose this computation is decomposed into two concurrent processes X and Y such that X computes the array a and Y computes the array b. The processes employ two binary semaphores R and S, both initialized to zero. The array a is shared by the two processes. The structures of the processes are shown below.

Process X;	Process Y;
private i;	private i;
$\text{for}(i = 0; i < n; i++)\{$	$\text{for}(i = 0; i < n; i++)\{$
$a[i] = f(i);$	$\text{EntryY}(R, S);$
$\text{ExitX}(R, S);$	$b[i] = g(a[i]);$
}	}

Which one of the following represents the **CORRECT** implementations of ExitX and EntryY?

(A) $\text{ExitX}(R,\ S)\{$
$P(R);$
$V(S);$
}
$\text{EntryY}(R,\ S)\{$
$P(S);$
$V(R);$
}

(B) $\text{ExitX}(R,\ S)\{$
$V(R);$
$V(S);$
}
$\text{EntryY}(R,\ S)\{$
$P(R);$
$P(S);$
}

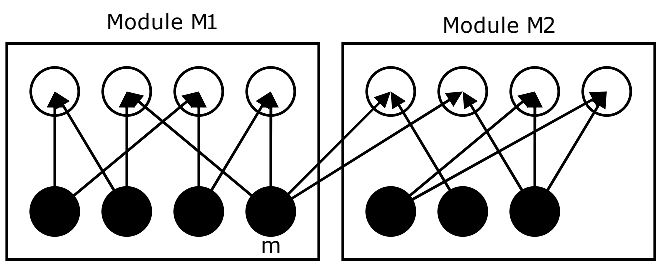
(C) ExitX(R, S) {
    P(S);
    V(R);
}
EntryY(R, S) {
    V(S);
    P(R);
}

(D) ExitX(R, S) {
    V(R);
    P(S);
}
EntryY(R, S) {
    V(S);
    P(R);
}

Answer:-(C)

Exp:- For computing both the array a[] and b[], first element a[i] should be computed using which b[i] can be computed. So process X and Y should run in strict alteration manner, starting with X. This requirement meets with implementation of ExitX and EntryY given in option C.

35. The following figure represents access graphs of two modules M1 and M2. The filled circles represent methods and the unfilled circles represent attributes. IF method m is moved to module M2 keeping the attributes where they are, what can we say about the average cohesion and coupling between modules in the system of two modules?



(A) There is no change

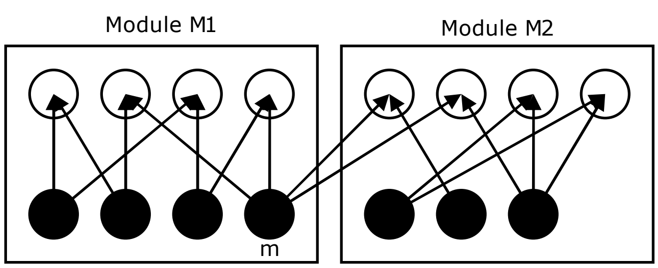
(B) Average cohesion goes up but coupling is reduced

(C) Average cohesion goes down and coupling also reduces

(D) Average cohesion and coupling increase

Answer:-(A)

Exp:-

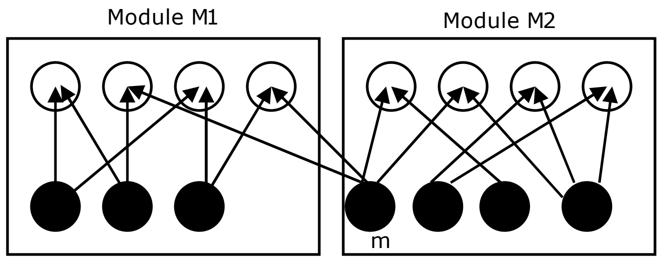


$$\text{Coupling} = \frac{\text{number of external links}}{\text{number of modules}} = \frac{2}{2}$$

$$\text{Cohesion of a module} = \frac{\text{number of internal links}}{\text{number of methods}}$$

$$\text{Cohesion of } M_1 = \frac{8}{4}; \text{ Cohesion of } M_2 = \frac{6}{3}; \quad \text{Average cohesion=2}$$

After moving method m to M2, graph will become



$\text{Coupling} = \frac{2}{2}$

$\text{Cohesion of } M_1 = \frac{6}{3}; \text{ Cohesion of } M_2 = \frac{8}{4};$ Average cohesion=2

$\therefore$ answer is no change

36. In an IPv4 datagram, the M bit is 0, the value of HLEN is 10, the value of total length is 400 and the fragment offset value is 300. The position of the datagram, the sequence numbers of the first and the last bytes of the payload, respectively are

(A) Last fragment, 2400 and 2789
(B) First fragment, 2400 and 2759
(C) Last fragment, 2400 and 2759
(D) Middle fragment, 300 and 689

Answer:-(C)

Exp:- M= 0 – Means there is no fragment after this, i.e. Last fragment
HLEN=10 - So header length is 4×10=40, as 4 is constant scale factor
Total Length = 400(40 Byte Header + 360 Byte Payload)
Fragment Offset = 300, that means 300×8 Byte = 2400 bytes are before this last fragment
So the position of datagram is last fragment
Sequence number of First Byte of Payload = 2400 (as 0 to 2399 Sequence no are used)
Sequence number of Last Byte of Payload = 2400+360-1=2759

37. Determine the maximum length of cable (in km) for transmitting data at a rate of 500 Mbps in an Ethernet LAN with frames of size 10,000 bits. Assume the signal speed in the cable to be 2,00,000 km/s

(A) 1
(B) 2
(C) 2.5
(D) 5

Answer:-(B)

Exp:- $500\times10^6 \text{ bits} ------1 \text{ sec}$

$$\therefore 10^4 \quad \text{bits} ------\frac{5\times10^8}{10^4} = \frac{10^4}{5\times10^8}\text{sec} = \frac{1}{5\times10^4}\text{sec}$$

$1 \text{ sec} ------2\times10^5 \text{ km}$

$$\therefore \frac{1}{5\times10^4}\text{sec} -----\frac{2\times10^5}{5\times10^4} = 4\,\text{km}$$

$$\therefore \text{Maximum length of cable} = \frac{4}{2} = 2 \text{ km}$$

38. Consider the following relational schema.

Students(rollno: integer, sname: string)

Courses(courseno: integer, cname: string)

Registration(rollno: integer, courseno; integer, percent: real)

Which of the following queries are equivalent to this query in English?

"Find the distinct names of all students who score more than 90% in the course numbered 107"

(I) SELECT DISTINCT S.sname
FROM Students as S, Registration as R
WHERE R.rollno=S.rollno AND R.Courseno=107 AND R.percent>90

(II) $\Pi_{sname}\left(\sigma_{courseno=107} \wedge percent > 90\left(Registration \quad Students\right)\right)$

(III) $\{T \mid \exists S \in Students, \exists R \in Registration\ (S.rollno = R.rollno \wedge$
$R.courseno = 107 \wedge R.percent > 90 \wedge T.sname = S.name)\}$

(IV) $\left\{< S_N > \mid \exists S_R \exists R_P \left(< S_R, S_N > \in Students \wedge < S_R, 107, R_P > \in Registration \wedge R_P > 90\right)\right\}$

(A) I, II, III and IV
(B) I, II and III only
(C) I, II and IV only
(D) II, III and IV only

Answer:- (A)

Exp:- Four queries given in SQL, RA, TRC and DRC in four statements respectively retrieve the required information.

39. A shared variable x, initialized to zero, is operated on by four concurrent processes W, X, Y, Z as follows. Each of the processes W and X reads x from memory, increments by one, stores it to memory, and then terminates. Each of the processes Y and Z reads x from memory, decrements by two, stores it to memory, and then terminates. Each process before reading x invokes the P operation (i.e., wait) on a counting semaphore S and invokes the V operation (i.e., signal) on the semaphore S after storing x to memory. Semaphore S is initialized to two. What is the maximum possible value of x after all processes complete execution?

(A) –2
(B) –1
(C) 1
(D) 2

Answer:-(D)

Exp:-

	W	X	Y	Z
1	R(x)	R(x)	R(x)	R(x)
2	x++	x++	x=x-2;	x=x-2;
3	w(x)	w(x)	w(x)	w(x)

R(x) is to read x from memory, w(x) is to store x in memory

(I) $w_1\left(x\boxed{0}\right)$ [W is Preempted]

(II) $Y_1, Y_2, Y_3\left(x\boxed{-2}\right)$ [Y is completed]

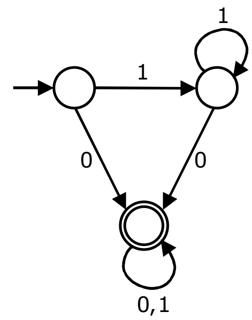
(III) $Z_1, Z_2, Z_3 \left(x \boxed{-4}\right)$ [Z is completed]

(IV) $W_2, W_3 \left(x \boxed{1}\right)$ [It increments local copy of x and stores & W is completed]

(V) $X_1, X_2, X_3 \left(x \boxed{2}\right)$ [X is completed]

Maximum value of x = 2

40. Consider the DFA given below.



Which of the following are FALSE?

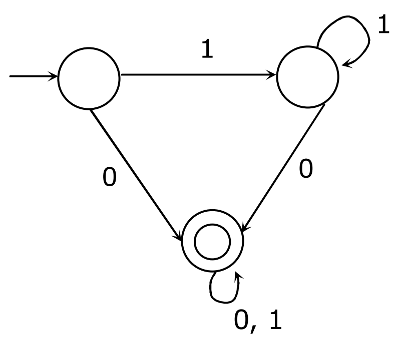
1. Complement of L(A) is context–free
2. $L(A) = L\left((11*0+0)(0+1)*0*1*\right)$
3. For the language accepted by A, A is the minimal DFA
4. A accepts all strings over {0, 1} of length at least 2

(A) 1 and 3 only (B) 2 and 4 only (C) 2 and 3 only (D) 3 and 4 only

Answer: - (D)

Exp:-

A :



(1) L(A) is regular, its complement is also regular and if it is regular it is also context free.

(2) $L(A) = (11*0+0)(0+1)*0*1* = 1*0\,(0+1)*$

Language has all strings where each string contains ‘0’.

(3) A is not minimal, it can be constructed with 2 states

(4) Language has all strings, where each string contains ‘0’. (atleast length one)

41. Consider the following languages

$L_1 = \{0^p 1^q 0^r \mid p, q, r \geq 0\}$

$L_2 = \{0^p 1^q 0^r \mid p, q, r \geq 0,\ p \neq r\}$

Which one of the following statements is FALSE?

(A) L_2 is context–free

(B) $L_1 \cap L_2$ is context–free

(C) Complement of L_2 is recursive

(D) Complement of L_1 is context–free but not regular

Answer: -(D)

Exp:- $L_1 = \{0^P 1^q 0^r \mid p, q, r \geq 0\}$ is regular

$L_2 = \{0^P 1^q 0^r \mid p, q, r \geq 0,\ p \neq r\}$ is CFL

(A) L_2 is CFL (True)

(B) $L_1 \cap L_2 =$ CFL (True)

(C) L_2 complement is recursive (True)

(D) L_1 complement is CFL but not regular (False) as L_1 is regular $\overline{L_1}$ is regular

42. Consider the following function

```
int unknown(int n){
        int i, j, k = 0;
        for (i = n / 2; i <= n; i ++)
          for (j = 2; j <= n; j = j * 2)
          k = k + n / 2;
        return (k);
}
```

The return value of the function is

(A) $\Theta(n^2)$ (B) $\Theta(n^2 \log n)$ (C) $\Theta(n^3)$ (D) $\Theta(n^3 \log n)$

Answer:- (B)

Exp:- $i = \left(\frac{n}{2}, \frac{n}{2}+1, \frac{n}{2}+2, \text{-----} n\right)$

Repeats $\frac{n}{2}$ to $n = \left(\frac{n}{2}+1\right)$ times $\boxed{\left.\begin{cases} J = (2, 2^2, 2^3, 2^4, \text{-----} n) \\ k = k + \frac{n}{2} \end{cases}\right\} k = \Theta(n \log n)}$

$$k = \frac{n}{2} + \frac{n}{2} + \text{----} \log n \text{ times} = \frac{n}{2} \log n$$

$$= \frac{n}{2}\log n + \frac{n}{2}\log n + \frac{n}{2}\log n ----\left(\frac{n}{2}+1\right)\text{times}$$

$$= \left(\frac{n}{2}+1\right).\frac{n}{2}\log n$$

$$= \Theta\left(n^2 \log n\right)$$

43. The number of elements that can be sorted in $\Theta(\log n)$ time using heap sort is

(A) $\Theta(1)$ (B) $\Theta\left(\sqrt{\log n}\right)$ (C) $\Theta\left(\frac{\log n}{\log \log n}\right)$ (D) $\Theta(\log n)$

Answer:-(A)

Exp:- After constructing a max-heap in the heap sort , the time to extract maximum element and then heapifying the heap takes $\Theta(\log n)$ time by which we could say that $\Theta(\log n)$ time is required to correctly place an element in sorted array. If $\Theta(\log n)$ time is taken to sort using heap sort, then number of elements that can be sorted is constant which is $\Theta(1)$

44. Consider a hard disk with 16 recording surfaces $(0-15)$ having 16384 cylinders $(0-16383)$ and each cylinder contains 64 sectors $(0-63)$. Data storage capacity in each sector is 512 bytes. Data are organized cylinder–wise and the addressing format is <cylinder no., sector no.>. A file of size 42797 KB is stored in the disk and the starting disk location of the file is <1200, 9, 40>. What is the cylinder number of the last sector of the file, if it is stored in a contiguous manner?

(A) 1281 (B) 1282 (C) 1283 (D) 1284

Answer: -(D)

Exp:- $42797\text{ KB} \equiv \frac{42797 \times 1024}{512} = 85594 \text{ sectors}$

Starting is $\langle 1200,9,40 \rangle$ contains total $24 + (6 \times 64) = 408 \text{ sectors}$

Next, 1201, --------, 1283 cylinders contains total $1024 \times 83 = 84992 \text{ sectors}$

$(\because \text{each cylinder contains } 16 \times 64 = 1024 \text{ sectors})$

$\therefore \text{Total} = 408 + 84992 = 85400 \text{ sectors}$

$\therefore$ The required cylinder number is $\langle 1284 \rangle$ which will contain the last sector of the file

45. Consider the following sequence of micro–operations

$\text{MBR} \leftarrow \text{PC}$

$\text{MAR} \leftarrow \text{X}$

$\text{PC} \leftarrow \text{Y}$

$\text{Memory} \leftarrow \text{MBR}$

Which one of the following is a possible operation performed by this sequence?

(A) Instruction fetch (B) Operand fetch

(C) Conditional branch (D) Initiation of interrupt service

Answer:-(D)

Exp:- PC content is stored in memory via MBR and PC gets new address from Y. It represents a function call (routine), which is matching with interrupt service initiation

46. The line graph L(G) of a simple graph G is defined as follows:

- There is exactly one vertex v(e) in L(G) for each edge e in G.
- For any two edges e and e' in G, L(G) has an edge between v(e) and v(e'), if and only if e and e' are incident with the same vertex in G.

Which of the following statements is/are **TRUE**?

(P) The line graph of a cycle is a cycle.

(Q) The line graph of a clique is a clique.

(R) The line graph of a planar graph is planar.

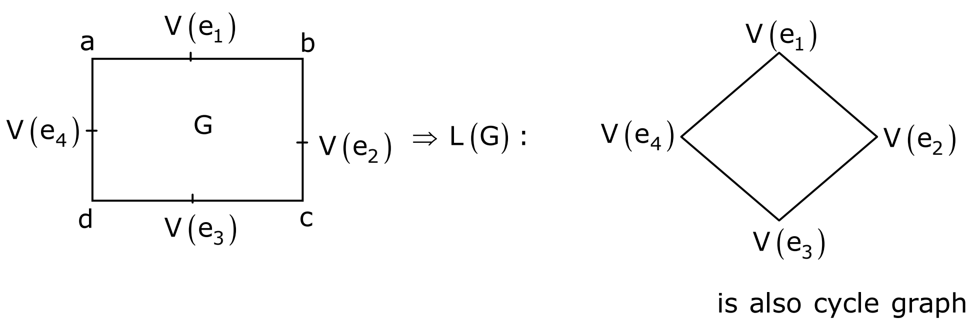
(S) The line graph of a tree is a tree.

(A) P only (B) P and R only

(C) R only (D) P, Q and S only

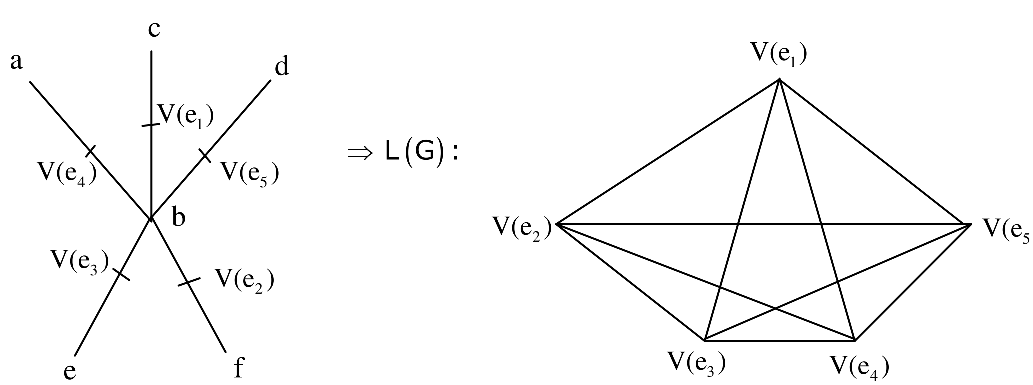
Answer: -(A)

Exp:- P) The line graph of a cycle is a cycle

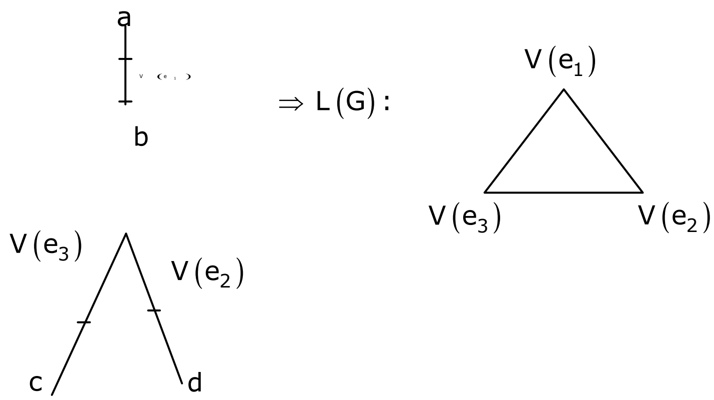


R) Line graph of planar graph need not be planar always. Consider the following example.

Consider the following planar graph (star graph)



S) Hence line graph of planar graph need not be planar(Here we got K_5 which is not planar).



The line graph of a tree need not be tree.

47. What is the logical translation of the following statement?

"None of my friends are perfect."

(A) $\exists x\left(F(x)\wedge\neg P(x)\right)$

(B) $\exists x\left(\neg F(x)\wedge P(x)\right)$

(C) $\exists x\left(\neg F(x)\wedge\neg P(x)\right)$

(D) $\neg\exists x\left(F(x)\wedge P(x)\right)$

Answer: -(D)

Exp:- "None of my friends are perfect"

$=\forall x\left(F(x)\rightarrow\neg P(x)\right)$

$=\forall x\left(\neg F(x)\vee\neg P(x)\right)$

$=\neg\exists x\left(F(x)\wedge P(x)\right)$

Common Data Questions: 48 & 49

The procedure given below is required to find and replace certain characters inside an input character string supplied in array A. The characters to be replaced are supplied in array oldc, while their respective replacement characters are supplied in array newc. Array A has a fixed length of five characters, while arrays oldc and newc contain three characters each. However, the procedure is flawed

```
void find_and_replace (char * A, char * oldc, char * newc) {
        for (int i = 0; i < 5; i++)
          for (int j = 0; j < 3; j++)
            if (A[i] == oldc[j])   A[i] = newc[j];
}
```

The procedure is tested with the following four test cases

(1) oldc = "abc", newc = "dab"

(2) oldc = "cde", newc = "bcd"

(3) oldc = "bca", newc = "cda"

(4) oldc = "abc", newc = "bac"

48. The tester now tests the program on all input strings of length five consisting of characters 'a', 'b', 'c', 'd' and 'e' with duplicates allowed. If the tester carries out this testing with the four test cases given above, how many test cases will be able to capture the flaw?

(A) Only one (B) Only two (C) Only three (D) All four

Answer:-(B)

Exp:- Flaw in this given procedure is that one character of Array 'A' can be replaced by more than one character of newc array, which should not be so.Test case (3) and (4) identifies this flaw as they are containing 'oldc' and 'newc' array characters arranged in specific manner. Following string can reflect flaw, if tested by test case (3).

initially i = j = 0

$$\underset{i=0}{A = "\underline{b}cda"} \qquad \underset{j=0}{\text{oldc} = "\underline{b}ca"} \qquad \underset{j=0}{\text{newc} = "\underline{c}da"}$$

$$\uparrow \qquad\qquad \uparrow \qquad\qquad \uparrow$$

b = b so replaced by c

Next i = 0 & j = 1

$$\underset{i=0}{A = "\underline{c}cda"} \qquad \underset{j=1}{\text{oldc} = "b\underline{c}a"} \qquad \underset{j=1}{\text{newc} = "c\underline{d}a"}$$

$$\uparrow \qquad\qquad \uparrow \qquad\qquad \uparrow$$

c = c so replaced by d

Likewise single character 'b' in A is replaced by 'c' and then by 'd'.
Same way test case (4) can also catch the flaw

49. If array A is made to hold the string "abcde", which of the above four test cases will be successful in exposing the flaw in this procedure?

(A) None (B) 2 only (C) 3 and 4 only (D) 4 only

Answer:-(C)

Exp:- Now for string "abcde" in array A, both test case (3) and (4) will be successful in finding the flaw, as explained in above question.

Common Data Questions: 50 & 51

The following code segment is executed on a processor which allows only register operands in its instructions. Each instruction can have almost two source operands and one destination operand. Assume that all variables are dead after this code segment

```
c = a + b;
d = c * a;
e = c + a;
x = c * c;
if (x > a) {
   y = a * a;
}
else {
   d = d * d;
   e = e * e;
}
```

50. Suppose the instruction set architecture of the processor has only two registers. The only allowed compiler optimization is code motion, which moves statements from one place to another while preserving correctness. What is the minimum number of spills to memory in the compiled code?

(A) 0 (B) 1 (C) 2 (D) 3

Answer:- (B)

Exp:- After applying the code motion optimization the statement d=c*a; and e=c+a; can be moved down to else block as d and e are not used anywhere before that and also value of a and c is not changing.

$c = a + b;$	$R_2 \leftarrow R_1 + R_2$
$x = c * c;$	$R_2 \leftarrow R_2 * R_2$ $[\text{spill}_c]$ 1 memory spill to store the value of c in memory
$\text{if } (x > a)$	CMP R_2 R_1
$\{\ y = a * a;\ \}$	$R_2 \leftarrow R_1 * R_1$

else{
 	
$d = c * a;$
$d = d * d;$
 	
$e = c + a;$
$e = e * e;$
}
	$R_2 \leftarrow [\text{spill}_c]$
	$R_2 \leftarrow R_2 * R_1$
	$R_2 \leftarrow R_2 * R_2$
	$R_2 \leftarrow [\text{spill}_c]$
	$R_2 \leftarrow R_2 + R_1$
	$R_2 \leftarrow R_2 * R_2$

In the above code total number of spills to memory is 1

51. What is the minimum number of registers needed in the instruction set architecture of the processor to compile this code segment without any spill to memory? Do not apply any optimization other than optimizing register allocation

(A) 3 (B) 4 (C) 5 (D) 6

Answer:- (B)

Exp:-

$c = a + b;$	$R_2 \leftarrow R_1 + R_2$
$d = c * a;$	$R_3 \leftarrow R_2 * R_1$
$e = c + a;$	$R_4 \leftarrow R_2 + R_1$
$x = c * c;$	$R_2 \leftarrow R_2 * R_2$

if $(x > a)$	CMP R_2 R_1
$\{ \ y = a * a; \ \}$	$R_1 \leftarrow R_1 * R_1$

else {
$d = d * d;$
$e = e * e;$
}
	$R_3 \leftarrow R_3 * R_3$
	$R_4 \leftarrow R_4 * R_4$

In the above code minimum number of registers needed are = 4

Linked Answer Questions: Q.52 to Q.55 Carry Two Marks Each

Statement for Linked Answer Questions: 52 & 53

Relation R has eight attributes ABCDEFGH. Fields of R contain only atomic values. $F = \{CH \to G, A \to BC, B \to CFH, E \to A, F \to EG\}$ is a set of functional dependencies (FDs) so that F^+ is exactly the set of FDs that hold for R

52. How many candidate keys does the relation R have?

(A) 3 (B) 4 (C) 5 (D) 6

Answer:-(B)

Exp:- Candidate keys are AD, BD, ED and FD

53. The relation R is

(A) in INF, but not in 2NF (B) in 2NF, but not in 3NF

(C) in 3NF, but not in BCNF (D) in BCNF

Answer:-(A)

Exp:- $A \to BC, B \to CFH$ and $F \to EG$ are partial dependencies. Hence it is in 1NF but not in 2NF

Statement for Linked Answer Questions: 54 & 55

A computer uses 46–bit virtual address, 32–bit physical address, and a three–level paged page table organization. The page table base register stores the base address of the first–level table (T_1) ,which occupies exactly one page. Each entry of T_1 stores the base address of a page of the second–level table (T_2). Each entry of T_2 stores the base address of a page of the third–level table (T_3) Each entry of T_3 stores a page table entry (PTE). The PTE is 32 bits in size. The processor used in the computer has a 1 MB 16 way set associative virtually indexed physically tagged cache. The cache block size is 64 bytes.

54. What is the size of a page in KB in this computer?

(A) 2 (B) 4 (C) 8 (D) 16

Answer:-(C)

Exp:- Let the page size be 2^X Bytes.

Then, the page offset = X bits

46-x	x

Now, we are using 3-level paging. First level page table is contained in one page. Each page table entry is 32-bit.

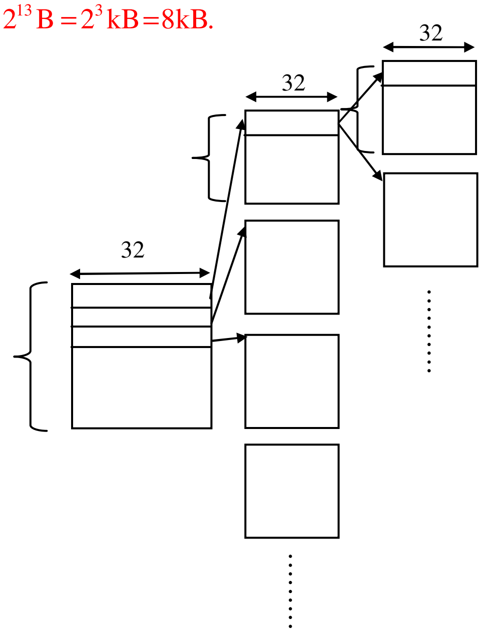
The size of T_3 is = $\frac{2^{46} * 2^2}{2^x} = 2^{46+2-x}$ [$\because$ PTE=32 bit = 4B = 2^2B]

The size of T_2 is = $\frac{2^{46+2-x} * 2^2}{2^x} = 2^{46+4-2x}$

The size of T_1 is = $\frac{2^{46+4-2x} * 2^2}{2^x} = 2^{46+6-3x} = 2^X$ [$\because T_1$ occupies exactly one page]

$\therefore\ 46+6-3x = x \ \Rightarrow x = 13$

So, page size = $2^{13}B = 2^3 kB = 8kB$.



55. What is the minimum number of page colours needed to guarantee that no two synonyms map to different sets in the processor cache of this computer?

(A) 2 (B) 4 (C) 8 (D) 16

Answer:- (C)

Exp:- As the page size is 2^{13} Bytes and page coloring is asked so we divide cache size by page size and group 16 pages in one set.

Number of pages in cache=1MB/8KB=128 pages

Number of set in cache=128/16=8 sets

Take any page of LAS, it will be mapped with cache on any one of these 8 sets (set association mapping).For any two synonym to map with same set they should be colored with same color of that respective set. So minimum we need 8 colors for this mapping.

Q. No. 56 – 60 Carry One Mark Each

56. Complete the sentence:

Universalism is to particularism as diffuseness is to ________

(A) specificity (B) neutrality (C) generality (D) adaptation

Answer:-(A)

Exp:- The relation is that of antonyms

57. Were you a bird, you ___________ in the sky.

(A) would fly (B) shall fly

(C) should fly (D) shall have flown

Answer:-(A)

58. Which one of the following options is the closest in meaning to the word given below?

Nadir

(A) Highest (B) Lowest (C) Medium (D) Integration

Answer:-(B)

Exp:- Nadir in the lowest point on a curve

59. Choose the grammatically INCORRECT sentence:

(A) He is of Asian origin (B) They belonged to Africa

(C) She is an European (D) They migrated from India to Australia

Answer:-(C)

60. What will be the maximum sum of 44, 42, 40, ... ?

(A) 502 (B) 504 (C) 506 (D) 500

Answer:-(C)

Exp:- The maximum sum is the sum of 44, 42,- - - -2.

The sum of 'n' terms of an AP

$$=\frac{n}{2}\left[2a+(n-1)d\right]$$

In this case, n = 22, a = 2 and d = 2

$$\therefore \text{Sum} = 11[4+21\times 2] = 11\times 46 = 506$$

Q. No. 61 – 65 Carry Two Marks Each

61. Out of all the 2-digit integers between 1 and 100, a 2-digit number has to be selected at random. What is the probability that the selected number is not divisible by 7?

(A) 13/90 (B) 12/90 (C) 78/90 (D) 77/90

Answer:- (D)

Exp:- The number of 2 digit multiples of 7 = 13

$\therefore$ Probability of choosing a number

Not divisible by $7 = \frac{90-13}{90} = \frac{77}{90}$

62. A tourist covers half of his journey by train at 60 km/h, half of the remainder by bus at 30 km/h and the rest by cycle at 10 km/h. The average of the tourist in km/h during his entire journey is

(A) 36 (B) 30 (C) 24 (D) 18

Answer:- (C)

Exp:- Let the total distance covered be 'D'

Now, average speed = $\frac{D}{\text{Total time taken}}$

$$= \frac{D}{\left(\frac{\frac{D}{2}}{60} + \frac{\frac{D}{4}}{30} + \frac{\frac{D}{4}}{10}\right)} = \frac{1}{\frac{1}{120} + \frac{1}{120} + \frac{1}{40}} = \frac{120}{5} = 24\,\text{km/hr}$$

63. Find the sum of the expression

$$\frac{1}{\sqrt{1}+\sqrt{2}} + \frac{1}{\sqrt{2}+\sqrt{3}} + \frac{1}{\sqrt{3}+\sqrt{4}} + \ldots\ldots + \frac{1}{\sqrt{80}+\sqrt{81}}$$

(A) 7 (B) 8 (C) 9 (D) 10

Answer:- (B)

Exp:- The expression can be written as

$$\frac{1}{\sqrt{1}+\sqrt{2}} + \frac{1}{\sqrt{2}+\sqrt{3}} + \frac{1}{\sqrt{3}+\sqrt{4}} + \ldots\ldots + \frac{1}{\sqrt{80}+\sqrt{81}}$$

$$= \frac{\sqrt{2}-\sqrt{1}}{\left(\sqrt{2}\right)^2-\left(\sqrt{1}\right)^2} + \frac{\sqrt{3}-\sqrt{2}}{\left(\sqrt{3}\right)^2-\left(\sqrt{2}\right)^2} + \frac{\sqrt{4}-\sqrt{3}}{\left(\sqrt{4}\right)^2-\left(\sqrt{3}\right)^2} + \ldots\ldots + \frac{\sqrt{81}-\sqrt{80}}{\left(\sqrt{81}\right)^2-\left(\sqrt{80}\right)^2}$$

$$= \sqrt{81} - \sqrt{1} = 8$$

64. The current erection cost of a structure is Rs. 13,200. If the labour wages per day increase by 1/5 of the current wages and the working hours decrease by 1/24 of the current period, then the new cost of erection in Rs. is

(A) 16,500 (B) 15,180 (C) 11,000 (D) 10,120

Answer:- (B)

Exp:- Let 'W' be the labour wages, and 'T' be the working hours.

Now, total cost is a function of $W \times T$

Increase in wages = 20%

$\therefore$ Revised wages = 1.2 W

$$\text{Decrease in labour time} = \left(\frac{100}{24}\right)\%$$

$$\therefore \text{ Revised time} = \left(1-\frac{1}{24}\right)T = \frac{23}{24}T$$

$$\therefore \text{ Revised Total cost} = 1.2\times\frac{23}{24}WT = 1.15WT$$
$$= 1.15\times 13200 = 15180$$

65. After several defeats in wars, Robert Bruce went in exile and wanted to commit suicide. Just before committing suicide, he came across a spider attempting tirelessly to have its net. Time and again, the spider failed but that did not deter it to refrain from making attempts. Such attempts by the spider made Bruce curious. Thus, Bruce started observing the near-impossible goal of the spider to have the net. Ultimately, the spider succeeded in having its net despite several failures. Such act of the spider encouraged Bruce not to commit suicide. And then, Bruce went back again and won many a battle, and the rest is history.

Which one of the following assertions is best supported by the above information?

(A) Failure is the pillar of success (B) Honesty is the best policy

(C) Life begins and ends with adventures (D) No adversity justifies giving up hope

Answer:- (D)

Q. No. 1 – 25 Carry One Mark Each

1. Which of the following problems are decidable?
   1) Does a given program ever produce an output?
   2) If L is context-free language, then, is $\overline{L}$ also context-free?
   3) If L is regular language, then, is $\overline{L}$ also regular?
   4) If L is recursive language, then, is $\overline{L}$ also recursive?

   (A) 1,2,3,4 (B) 1,2 (C) 2,3,4 (D) 3,4

Answer:- (D)

Exp:- CFL's are not closed under complementation. Regular and recursive languages are closed under complementation.

2. Given the language L-{ab, aa, baa}, which of the following strings are in L*?
   1) abaabaaabaa
   2) aaaabaaaa
   3) baaaaabaaaab
   4) baaaaabaa

   (A) 1,2 and 3 (B) 2,3 and 4 (C) 1,2 and 4 (D) 1,3 and 4

Answer:-(C)

Exp:- $L = \{ab,\ aa,\ baa\}$

Let S1 = ab , S2 = aa and S3 =baa

abaabaaabaa can be written as S1S2S3S1S2

aaaabaaaa can be written as S1S1S3S1

baaaaabaa can be written as S3S2S1S2

3. In the IPv4 addressing format, the number of networks allowed under Class C addresses is

   (A) 2^{14} (B) 2^{7} (C) 2^{21} (B) 2^{24}

Answer:-(C)

Exp:- For class C address, size of network field is 24 bits. But first 3 bits are fixed as 110; hence total number of networks possible is 2^{21}

4. Which of the following transport layer protocols is used to support electronic mail?

   (A) SMTP (B) IP (C) TCP (D) UDP

Answer:-(C)

Exp:- E-mail uses SMTP, application layer protocol which intern uses TCP transport layer protocol.

5. Consider a random variable X that takes values + 1 and -1 with probability 0.5 each. The values of the cumulative distribution function F(x) at x = -1 and +1 are

   (A) 0 and 0.5 (B) 0 and 1

(C) 0.5 and 1 (D) 0.25 and 0.75

Answer:-(C)

Exp:- The cumulative distribution function

$$F(x)=P(X\le x)$$

$$F(-1)=P(X\le -1)=P(X=-1)=0.5$$

$$F(+1)=P(X\le +1)=P(X=-1)+P(X=+1)=0.5+0.5=1$$

6. Register renaming is done is pipelined processors

(A) as an alternative to register allocation at compile time

(B) for efficient access to function parameters and local variables

(C) to handle certain kinds of hazards

(D) as part of address translation

Answer:-(C)

Exp:- Register renaming is done to eliminate WAR/WAW hazards.

7. The amount of ROM needed to implement a 4 bit multiplier is

(A) 64 bits (B) 128 bits (C) 1 Kbits (D) 2 Kbits

Answer:-(D)

Exp:- For a 4 bit multiplier there are $2^4 \times 2^4 = 2^8 = 256$ combinations.

Output will contain 8 bits.

So the amount of ROM needed is $2^8 \times 8$ bits $= 2$ Kbits.

8. Let W(n) and A(n) denote respectively, the worst case and average case running time of an algorithm executed on an input of size n. Which of the following is **ALWAYS TRUE**?

(A) $A(n)=\Omega(W(n))$ (B) $A(n)=\Theta(W(n))$

(C) $A(n)=O(W(n))$ (D) $A(n)=o(W(n))$

Answer:-(C)

Exp:- The average case time can be lesser than or even equal to the worst case. So A(n) would be upper bounded by W(n) and it will not be strict upper bound as it can even be same (e.g. Bubble Sort and merge sort).

$$\therefore A(n)=O(W(n))$$

9. Let G be a simple undirected planar graph on 10 vertices with 15edges. If G is a connected graph, then the number of **bounded** faces in any embedding of G on the plane is equal to

(A) 3 (B) 4 (C) 5 (D) 6

Answer:-(D)

Exp:- We have the relation V-E+F=2, by this we will get the total number of faces,

F = 7. Out of 7 faces one is an unbounded face, so total 6 bounded faces.

10. The recurrence relation capturing the optimal execution time of the *Towers of Hanoi* problem with n discs is

(A) $T(n) = 2T(n-2) + 2$ (B) $T(n) = 2T(n-1) + n$

(C) $T(n) = 2T(n/2) + 1$ (D) $T(n) = 2T(n-1) + 1$

Answer:-(D)

Exp:- Let the three pegs be A,B and C, the goal is to move n pegs from A to C using peg B

The following sequence of steps are executed recursively

1.move $n-1$ discs from A to B. This leaves disc n alone on peg A --- **T(n-1)**

2.move disc n from A to C---------**1**

3.move $n-1$ discs from B to C so they sit on disc n----- **T(n-1)**

So, T(n) = 2T(n-1) +1

11. Which of the following statements are **TRUE** about an SQL query?

P : An SQL query can contain a HAVING clause even if it does not have a GROUP BY clause

Q : An SQL query can contain a HAVING clause only if it has GROUP BY clause

R : All attributes used in the GROUP BY clause must appear in the SELECT clause

S : Not all attributes used in the GROUP BY clause need to appear in the SELECT clause

(A) P and R (B) P and S (C) Q and R (D) Q and S

Answer:-(B)

Exp:- If we use a HAVING clause without a GROUP BY clause, the HAVING condition applies to all rows that satisfy the search condition. In other words, all rows that satisfy the search condition make up a single group. So, option P is true and Q is false.

S is also true as an example consider the following table and query.

Id	Name
1	Ramesh
2	Ramesh
3	Rajesh
4	Suresh

Select count (*)
From student
Group by Name

Output will be

Count (*)
2
1

1

12. Given the basic ER and relational models, which of the following is **INCORRECT**?

(A) An attribute of an entity can have more than one value

(B) An attribute of an entity can be composite

(C) In a row of a relational table, an attribute can have more than one value

(D) In a row of a relational table, an attribute can have exactly one value or a NULL value

Answer:-(C)

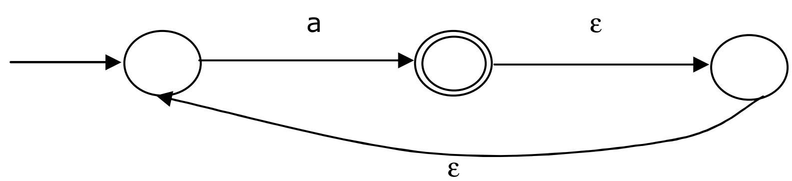
Exp:- The term 'entity' belongs to ER model and the term 'relational table' belongs to relational model.

Options A and B both are true since ER model supports both multivalued and composite attributes.

As multivalued attributes are not allowed in relational databases, in a row of a relational (table), an attribute cannot have more than one value.

13. What is the complement of the language accepted by the NFA show below?

Assume $\Sigma = \{a\}$ and ε is the empty string.



(A) $\varnothing$ (B) $\{\varepsilon\}$ (C) a^* (D) $\{a, \varepsilon\}$

Answer:- (B)

Exp:- Language accepted by NFA is a^+, so complement of this language is $\{\epsilon\}$

14. What is the correct translation of the following statement into mathematical logic?

"Some real numbers are rational"

(A) $\exists x\ (\text{real}(x) \vee \text{rational}(x))$ (B) $\forall x\ (\text{real}(x) \rightarrow \text{rational}(x))$

(C) $\exists x\ (\text{real}(x) \wedge \text{rational}(x))$ (D) $\exists x\ (\text{rational}(x) \rightarrow \text{real}(x))$

Answer:- (C)

Exp:- Option A: There exists x which is either real or rational and can be both.

Option B: All real numbers are rational

Option C: There exists a real number which is rational.

Option D: There exists some number which is not rational or which is real.

15. Let A be the 2 x 2 matrix with elements $a_{11} = a_{12} = a_{21} = +1$ and $a_{22} = -1$. Then the eigen values of the matrix A^{19} are

(A) 1024 and -1024 (B) $1024\sqrt{2}$ and $-1024\sqrt{2}$

(C) $4\sqrt{2}$ and $-4\sqrt{2}$ (D) $512\sqrt{2}$ and $-512\sqrt{2}$

Answer:-(D)

Exp:- Characteristic equation of A is $|A-\lambda I|=0$ where λ is the eigen value

$$\begin{vmatrix} 1-\lambda & 1 \\ 1 & -1-\lambda \end{vmatrix} = 0 \Rightarrow \lambda^2 - 2 = 0 \Rightarrow \lambda^2 = \pm\sqrt{2}$$

Every matrix satisfies its characteristic equation

Therefore $A^2 - 2I = 0 \Rightarrow A^2 = 2I$

$$A^{19} = A^{18} \times A = \left(A^2\right)^9 \times A = (2I)^9 \times A = 512 \times A$$

Hence eigen values of A^{19} are $\pm 512\sqrt{2}$

16. The protocol data unit (PDU) for the application layer in the Internet stack is

(A) Segment (B) Datagram (C) Message (D) Frame

Answer:-(C)

Exp:- The PDU for Datalink layer, Network layer , Transport layer and Application layer are frame, datagram, segment and message respectively.

17. Consider the function f(x) = sin(x) in the interval $x \in [\pi/4, 7\pi/4]$. The number and location (s) of the local minima of this function are

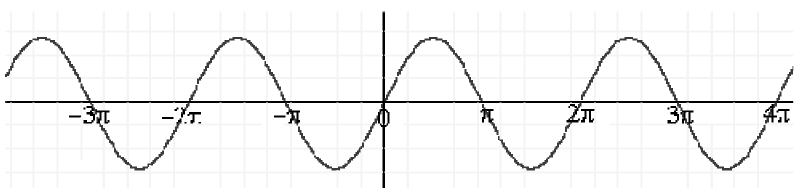
(A) One, at $\pi/2$ (B) One, at $3\pi/2$

(C) Two, at $\pi/2$ and $3\pi/2$ (D) Two, at $\pi/4$ and $3\pi/2$

Answer:-(B)

Exp:- Sin x has a maximum value of 1 at $\frac{\pi}{2}$, and a minimum value of –1 at $\frac{3\pi}{2}$ and at all angles conterminal with them.

The graph of $f(x) = \sin x$ is



$\therefore$ In the interval $\left[\frac{\pi}{4}, \frac{7\pi}{4}\right]$, it has one local minimum at $x = \frac{3\pi}{2}$

18. A process executes the code

fork ();
fork ();
fork ();

The total number of **child** processes created is

(A) 3 (B) 4 (C) 7 (D) 8

Answer:- (C)

Exp:- If fork is called n times, there will be total 2^n running processes including the parent process. So, there will be 2^n-1 child processes.

19. The decimal value 0.5 in IEEE single precision floating point representation has

(A) fraction bits of 000…000 and exponent value of 0

(B) fraction bits of 000…000 and exponent value of -1

(C) fraction bits of 100…000 and exponent value of 0

(D) no exact representation

Answer:-(B)

Exp:- $(0.5)_{10} = (1.0)_2 \times 2^{-1}$

So, exponent = -1 and fraction is 000 - - - 000

20. The truth table

X	Y	f(X,Y)
0	0	0
0	1	0
1	0	1
1	1	1

represents the Boolean function

(A) X (B) X + Y (C) $X \oplus Y$ (D) Y

Answer:- (A)

Exp:- $XY' + XY = X(Y' + Y) = X$

21. The worst case running time to search for an element in a balanced binary search tree with $n2^n$ elements is

(A) $\Theta(n \log n)$ (B) $\Theta(n2^n)$ (C) $\Theta(n)$ (D) $\Theta(\log n)$

Answer:-(C)

Exp:- The worst case search time in a balanced BST on 'x' nodes is logx. So, if x = $n2^n$, then $\log(n2^n) = \log n + \log(2^n) = \log n + n = \theta(n)$

22. Assuming $P \neq NP$, which of the following is **TRUE**?

(A) NP-complete = NP (B) NP-complete $\cap P = \varnothing$

(C) NP-hard = NP (D) P = NP-complete

Answer:-(B)

Exp:- If P!=NP, then it implies that no NP-Complete problem can be solved in polynomialtime which implies that the set P and the set NPC are disjoint.

23. What will be the output of the following C program segment?

```
Char inChar = 'A' ;
switch (inChar ) {
case 'A' : printf ("Choice A\ n");
case 'B' :
case 'C' : print f("Choice B");
case 'D' :
case 'E' :
default  : printf ("No Choice") ; }
```

(A) No choice

(B) Choice A

(C) Choice A
Choice B No choice

(D) Program gives no output as it is erroneous

Answer:-(C)

Exp:- Since there is no 'break' statement , the program executes all the subsequent case statements after printing "choice A"

24. Which of the following is **TRUE?**

(A) Every relation is 3NF is also in BCNF

(B) A relation R is in 3NF if every non-prime attribute of R is fully functionally dependent on every key of R

(C) Every relation in BCNF is also in 3NF

(D) No relation can be in both BCNF and 3NF

Answer:-(C)

Exp:- Option A is false since BCNF is stricter than 3NF (it needs LHS of all FDs should be candidate key for 3NF condition)

Option B is false since the definition given here is of 2NF

Option C is true, since for a relation to be in BCNF it needs to be in 3NF, every relation in BCNF satisfies all the properties of 3NF.

Option D is false, since if a relation is in BCNF it will always be in 3NF.

25. Consider the following logical inferences.

I_1 : If it rains then the cricket match will not be played.
The cricket match was played.
Inference: There was no rain.

I_2 : If it rains then the cricket match will not be played.
It did not rain.
Inference: The cricket match was played.

Which of the following is **TRUE**?

(A) Both I_1 and I_2 are correct inferences

(B) I_1 is correct but I_2 is not a correct inference

(C) I_1 is not correct but I_2 is a correct inference

(D) Both I_1 and I_2 are not correct inferences

Answer:- (B)

Exp:-

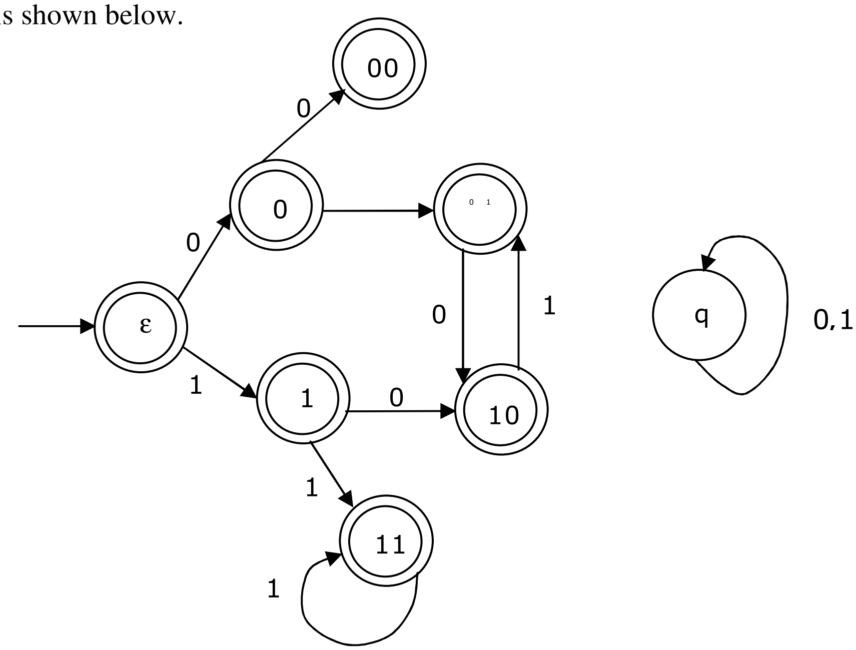
$$I_1: \quad R \rightarrow \sim C \approx \sim R \vee \sim C$$
$$\begin{array}{c} C \\ \hline \sim R \\ \hline \end{array} \quad (\text{there was no rain})$$

$$I_2: \quad R \rightarrow \sim C \approx \sim R \vee \sim C$$
$$\begin{array}{cc} \sim R & \sim R \\ \hline & \sim R \vee C \\ \hline \end{array}$$

$(I_1 \text{ is correct and } I_2 \text{ is not correct inference})$

Q. No. 26 – 51 Carry Two Marks Each

26. Consider the set of strings on {0,1} in which, *every substring of 3 symbols* has at most two zeros. For example, 001110 and 011001 are in the language, but 100010 is not. All strings of length less than 3 are also in the language. A partially completed DFA that accepts this language is shown below.



The missing arcs in the DFA are

(A)

	00	**01**	**10**	**11**	**q**
00	1	0			
01				1	
10	0				
11			0		

(B)

	00	**01**	**10**	**11**	**q**
00		0			1
01		1			
10				0	
11		0			

(C)

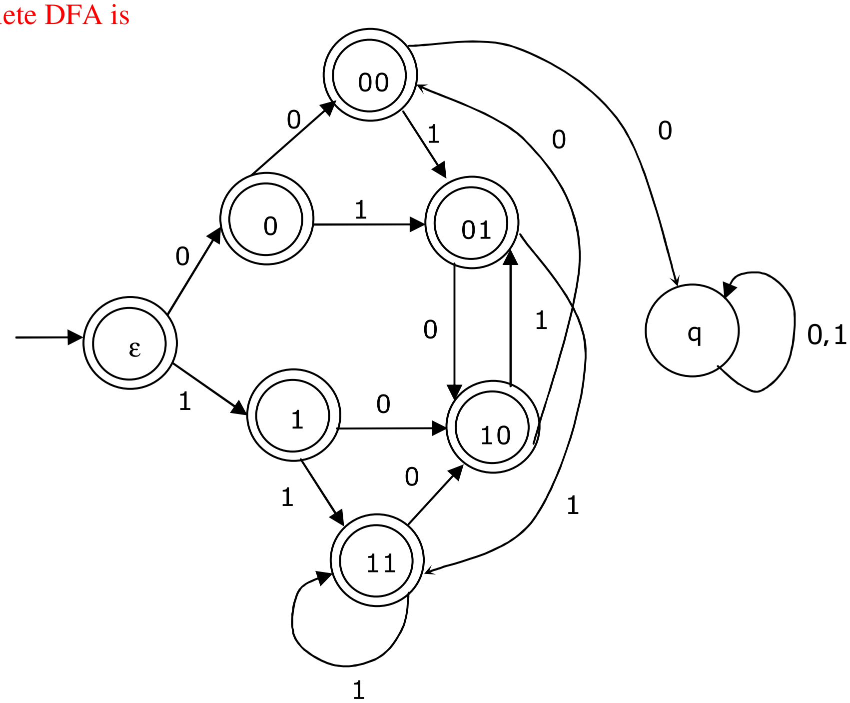
	00	**01**	**10**	**11**	**q**
00		1			0
01		1			
10			0		
11		0			

(D)

	00	**01**	**10**	**11**	**q**
00		1			0
01				1	
10	0				
11			0		

Answer:-(D)

Exp:- The complete DFA is



27. The height of a tree is defined as the number of edges on the longest path in the tree. The function shown in the pseudocode below is invoked as height (root) to compute the height of a binary tree rooted at the tree pointer root.

int height (treeptr n)

{ if (n== NULL) return -1;

if $\left(n \rightarrow \text{left} == \text{NULL}\right)$

```
        if (n → right == NULL) return 0;
        else return [B1];                                   // Box 1
    else {h1 = height (n → left);
        if (n → right == NULL) return (1 + h1);
        else {h2 = height (n → right);
                    return [B2] ;                           // Box 2
                    }
    }
}
```

The appropriate expressions for the two boxes B1 and B2 are

(A) $B1: (1 + \text{height}(n \to \text{right}))$

$B2: (1 + \max(h1, h2))$

(B) $B1: (\text{height}(n \to \text{right}))$

$B2: (1 + \max(h1, h2))$

(C) $B1: \text{height}(n \to \text{right})$

$B2: \max(h1, h2)$

(D) $B1: (1 + \text{height}(n \to \text{right}))$

$B2: \max(h1, h2)$

Answer:-(A)

Exp:- int height (treeptr n)

```
{       if (n = = nu11) return – 1;
                        → /*   If there is no node, return -1     */

        if (n → left == NULL) → /* If there is no left child for node 'n' */

                if (n → right == NULL) return O;
                        → /*If no left child & no right child for 'n', return */
                else return (1+height (n → right) );
                        → /*   If no left child, but there is a right child, then compute height
                        for right sub tree. Therefore total height is 1+ height (n → right) */

        else { → / *   If there exist left child node for node 'n' */

                h1 = height (n → left);
                        → / * First Find the height of left sub tree for node 'n' */

                If (n → right == NULL) return (1 + h1);
```

$\rightarrow$ /* If there exist left child and no right child and no right child for a node 'n', then total height
= height from (n to $n \rightarrow$ left) + left sub tree height
$=1 + \text{height}\ (n \rightarrow \text{left}) = 1 + h1$ */

else {h_2 = height $(n \rightarrow \text{right})$;

$\rightarrow$/* If there exist right child also, then compute height of right sub tree for a node 'n' */

return $(1 + \max\ (h_1, h_2))$;

$\rightarrow$ /* Total height for node 'n'=
1 + Max (Left Subtree height, Right sub tree height)
= 1 + Max (h_1, h_2) */

}

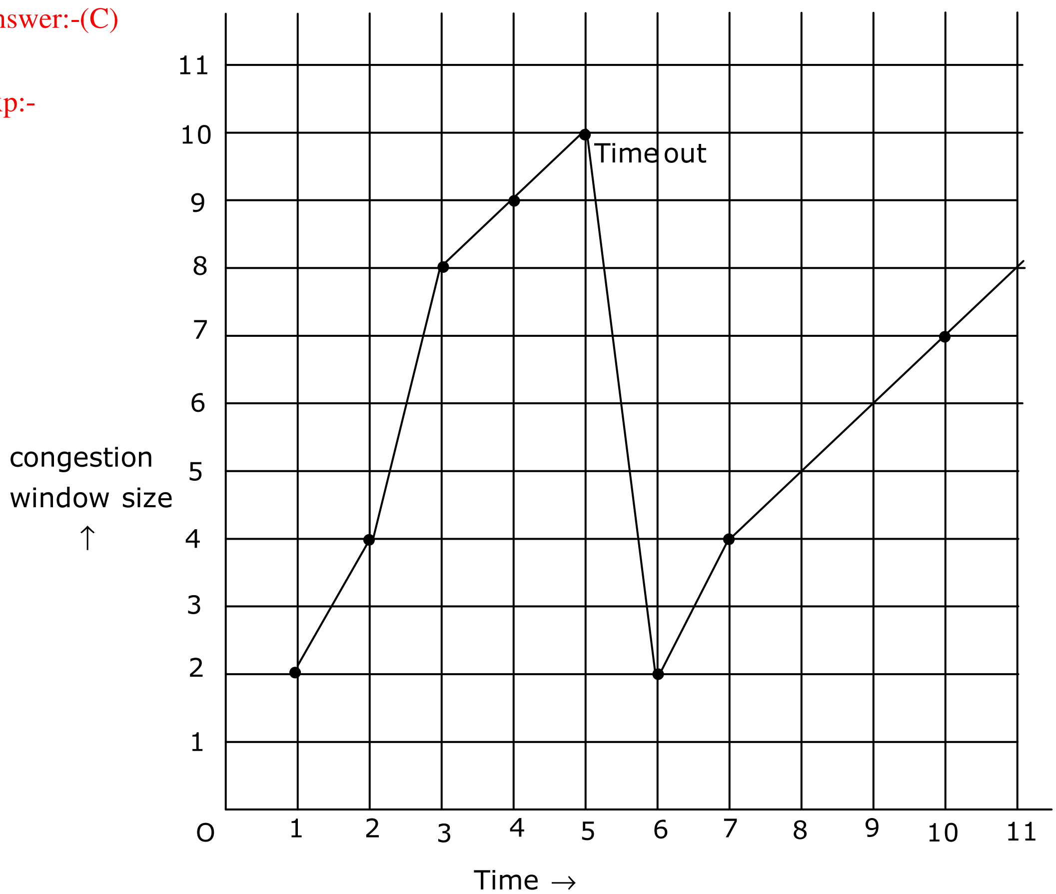
}

28. Consider an instance of TCP's Additive Increase Multiplicative decrease (AIMD) algorithm where the window size at the start of the slow start phase is 2 MSS and the threshold at the start of the first transmission is 8 MSS. Assume that a timeout occurs during the fifth transmission. Find the congestion window size at the end of the tenth transmission.

(A) 8MSS (B) 14MSS (C) 7MSS (D) 12MSS

Answer:-(C)

Exp:-



Given, initial threshold = 8

Time = 1, during 1st transmission,Congestion window size = 2 (slow start phase)

Time = 2, congestion window size = 4 (double the no. of acknowledgments)

Time = 3, congestion window size = 8 (Threshold meet)

Time = 4, congestion window size = 9, after threshold (increase by one Additive increase)

Time = 5, transmits 10 MSS, but time out occurs congestion window size = 10

Hence threshold = (Congestion window size)/2 = $^{10}\!/_{2} = 5$

Time = 6, transmits 2

Time = 7, transmits 4

Time = 8, transmits 5 (threshold is 5)

Time = 9, transmits 6, after threshold (increase by one Additive increase)

Time = 10, transmits 7

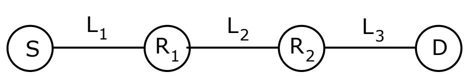
$\therefore$ During 10^{th} transmission, it transmits 7 segments hence at the end of the tenth transmission the size of congestion window is 7 MSS.

29. Consider a source computer (S) transmitting a file of size 10^6 bits to a destination computer (D) over a network of two routers (R_1 and R_2) and three links (L_1, L_2, and L_3). L_1 connects S to R_1; L_2 connects R_1 to R_2; and L_3 connects R_2 to D. Let each link be of length 100km. Assume signals travel over each line at a speed of 10^8 meters per second. Assume that the link bandwidth on each link is 1Mbps. Let the file be broken down into 1000 packets each of size 1000 bits. Find the total sum of transmission and propagation delays in transmitting the file from S to D?

(A) 1005ms (B) 1010ms (C) 3000ms (D) 3003ms

Answer:- (A)

Exp:-



Transmission delay for 1 packet from each of S, R_1 and R_2 will take 1ms

Propagation delay on each link L_1, L_2 and L_3 for one packet is 1ms

Therefore the sum of transmission delay and propagation delay on each link for one packet is 2ms.

The first packet reaches the destination at 6^{th}ms

The second packet reaches the destination at 7^{th}ms

So inductively we can say that 1000^{th} packet reaches the destination at 1005^{th} ms

30. Suppose R1 $(\underline{A}, B)$ and R_2 $(\underline{C}, D)$ are two relation schemas. Let r_1 and r_2 be the corresponding relation instances. B is a foreign key that refers to C in R_2. If data in r_1 and r_2 satisfy referential integrity constrains, which of the following is **ALWAYS TRUE**?

(A) $\Pi_B(r_1) - \Pi_C(r_2) = \varnothing$ (B) $\Pi_C(r_2) - \Pi_B(r_1) = \varnothing$

(C) $\Pi_B(r_1) = \Pi_C(r_2)$ (D) $\Pi_B(r_1) - \Pi_C(r_2) \neq \varnothing$

Answer:-(A)

Exp:- Since B is a foreign key referring C,values under B will be subset of values under C ($\Pi_B(r_1) \subseteq \Pi_C(r_2) \Rightarrow \Pi_B(r_1) - \Pi_C(r_2) = \varnothing$)

31. Consider the virtual page reference string

1,2,3,2,4,1,3,2,4,1

on a demand paged virtual memory system running on a computer system that has main memory size of 3 page frames which are initially empty. Let LRU, FIFO and OPTIMAL denote the number of page faults under the corresponding page replacement policy. Then

(A) OPTIMAL < LRU < FIFO (B) OPTIMAL < FIFO < LRU

(C) OPTIMAL = LRU (D) OPTIMAL = FIFO

Answer:- (B)

Exp:- FIFO

```
1  1  1  4  4  4
   2  2  2  1  1        → (6) faults
      3  3  3  2
```

Optimal

```
1  1  1  1  1
   2  2  4  4           → (5) faults
      3  3  2
```

LRU

```
1  1  1  4  4  4  2  2  2
   2  2  2  2  3  3  3  1      → (9) faults
      3  3  1  1  1  4  4
```

Optimal < FIFO < LRU

32. A file system with 300 GByte disk uses a file descriptor with 8 direct block addresses, 1 indirect block address and 1 doubly indirect block address. The size of each disk block is 128 Bytes and the size of each disk block address is 8 Bytes. The maximum possible file size in this file system is

(A) 3 KBytes (B) 35 KBytes

(C) 280 KBytes (D) dependent on the size of the disk

Answer:-(B)

Exp:- Each block size = 128 Bytes

Disk block address = 8 Bytes

$\therefore$ Each disk can contain = $\frac{128}{8} = 16$ addresses

Size due to 8 direct block addresses: 8 x 128

Size due to 1 indirect block address: 16 x 128

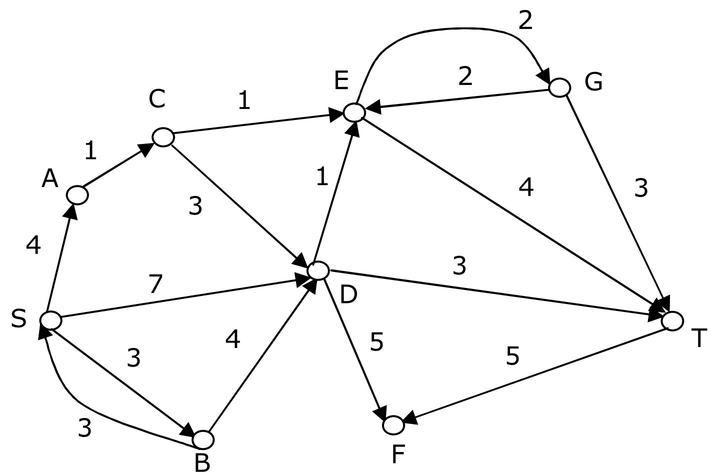
Size due to 1 doubly indirect block address: 16 x 16 x 128

Size due to 1 doubly indirect block address: 16 x 16 x 128

So, maximum possible file size:

$= 8\times128 + 16\times128 + 16\times16\times128 = 1024 + 2048 + 32768 = 35840 \text{ Bytes} = 35\,\text{KBytes}$

33. Consider the directed graph shown in the figure below. There are multiple shortest paths between vertices S and T. Which one will be reported by Dijkstra's shortest path algorithm? Assume that, in any iteration, the shortest path to a vertex *v* is updated only when a strictly shorter path to *v* is discovered.



(A) SDT (B) SBDT (C) SACDT (D) SACET

Answer:- (D)

Exp:- Let d[v] represent the shortest path distance computed from 'S'

Initially d[S]=0, d[A] = ∞, $d[B] = \infty.----, d[T] = \infty$

And let P[v] represent the predecessor of v in the shortest path from 'S' to 'v' and let P[v]=-1 denote that currently predecessor of 'v' has not been computed

$\rightarrow$ Let Q be the set of vertices for which shortest path distance has not been computed

$\rightarrow$ Let W be the set of vertices for which shortest path distance has not been computed

$\rightarrow$ So initially, $Q = \{S, A, B, C, D, E, F, G, T\}, W = \phi$

We will use the following procedure

Repeat until Q is empty

{

1 u = choose a vertex from Q with minimum d[u] value

2. $Q = Q - u$

3. update all the adjacent vertices of u

4. W = W U{u}

}

d[S] = 0, d[A] = ∞, d[B] = ∞ ,………, d[T] = ∞

Iteration 1

Step 1 : $u = S$

Step 2 : $Q = \{A, B, C, D, E, F, G, T\}$

Step 3: final values after adjustment

$$d[S] = 0, d[A] = 4, d[B] = 3, d[C] = \infty, d[D] = 7, d[E] = \infty - —, d[T] = \infty$$

$$P[A] = S, P[B] = S, P[C] = -1, P[D] = S, P[E] = -1 - —, P[T] = -1$$

Step 4 : $W = \{S\}$

Iteration 2:

Step 1: $u = B$

Step 2: $Q = \{A, C, D, E, F, G, T\}$

step 3: final values after adjustment

$$d[S] = 0, d[A] = 4, d[B] = 3, d[C] = \infty, d[D] = 7, d[E] = \infty - —, d[T] = \infty$$

$$P[A] = S, P[B] = S, P[C] = -1, P[D] = S, P[E] = -1 - —, P[T] = -1$$

Step 4: $W = \{S, B\}$

Iteration 3:

Step 1: $u = A$

Step 2: $Q = \{C, D, E, F, G, T\}$

step 3: final values after adjustment

$$d[S] = 0, d[A] = 4, d[B] = 3, d[C] = 5, d[D] = 7, d[E] = \infty - —, d[T] = \infty$$

$$P[A] = S, P[B] = S, P[C] = A, P[D] = S, P[E] = -1 - —, P[T] = -1$$

Step 4: $W = \{S, B, A\}$

Iteration 4:

Step 1: $u = C$

Step 2: $Q = \{D, E, F, G, T\}$

step 3: final values after adjustment

$$d[S] = 0, d[A] = 4, d[B] = 3, d[C] = 5, d[D] = 7, d[E] = 6, - - -, d[T] = \infty$$

$$P[A] = S, P[B] = S, P[C] = A, P[D] = S, P[E] = C, - - -, P[T] = -1$$

Step 4: $W = \{S, B, A, C\}$

Iteration 5:

$\text{Step 1}: u = E$

$\text{Step 2}: Q = \{D, F, G, T\}$

$\text{step 3}: \text{final values after adjustment}$

$$d[S]=0, d[A]=4, d[B]=3, d[C]=5, d[D]=7, d[E]=6, d[F]=\infty, d[G]=8, d[T]=10$$

$$P[A]=S, P[B]=S, P[C]=A, P[D]=S, P[E]=C, P[F]=-1, P[G]=E, P[T]=E$$

$\text{Step 4}: W = \{S, B, A, C, E\}$

After iteration 5, we can observe that P[T]=E , P[E]=C , P[C]=A , P[A]=S,
So the shortest path from S to T is SACET

34. A list of n strings, each of length n, is sorted into lexicographic order using the merge-sort algorithm. The worst case running time of this computation is

(A) $O(n \log n)$ (B) $O(n^2 \log n)$

(C) $O(n^2 + \log n)$ (D) $O(n^2)$

Answer:-(B)

Exp:- The height of the recursion tree using merge sort is logn and n^2 comparisons are done at each level, where at most n pairs of strings are compared at each level and n comparisons are required to compare any two strings, So the worst case running time is $O(n^2 \log n)$

35. Let G be a complete undirected graph on 6 vertices. If vertices of G are labeled, then the number of distinct cycles of length 4 in G is equal to

(A) 15 (B) 30 (C) 90 (D) 360

Answer:- No option matching (marks to all)

Exp:- 4 vertices from 6 vertices can be chosen in in ${}^6c_4$. Number of cycles of length 4 that can be formed from those selected vertices is (4-1)!/2 (left or right/ up or down does not matter), so total number of 4 length cycles are $({}^6c_4.3!)/2 = 45$.

36. How many onto (or surjective) functions are there from an n-element $(n \geq 2)$ set to a 2-element set?

(A) 2^n (B) 2^n-1 (C) 2^n - 2 (D) $2(2^n$-2)

Answer:- (C)

Exp:- Total number of functions is 2^n, out of which there will be exactly two functions where all elements map to exactly one element, so total number of onto functions is 2^n-2

37. Consider the program given below, in a block-structured pseudo-language with lexical scoping and nesting of procedures permitted.

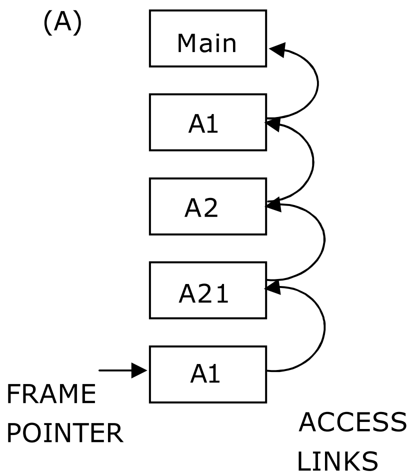
```
Program main;
  Var . . .
  Procedure A1;
    Var ….
```

```
    Call A2;
  End A1
  Procedure A2;
    Var . . .
    Procedure A21;
        Var . . .
       Call A1;
   End A21
   Call A21;
End A2
  Call A1;
End main.
```

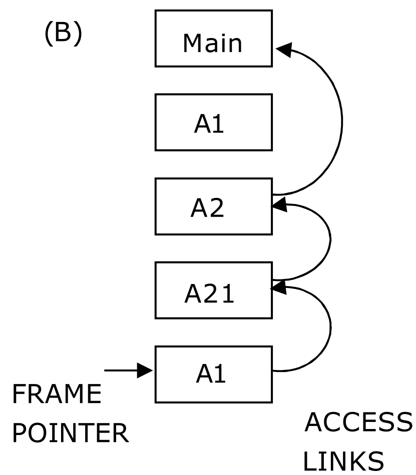
Consider the calling chain: Main $\rightarrow$ A1 $\rightarrow$ A2 $\rightarrow$ A21 $\rightarrow$ A1

The correct set of activation records along with their access links is given by

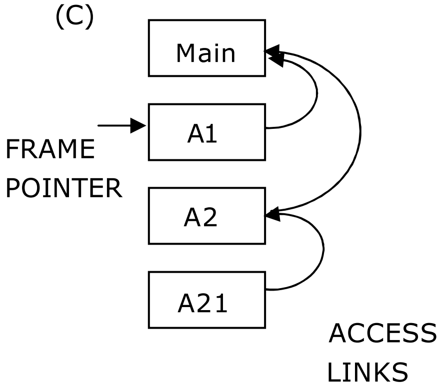
(A)



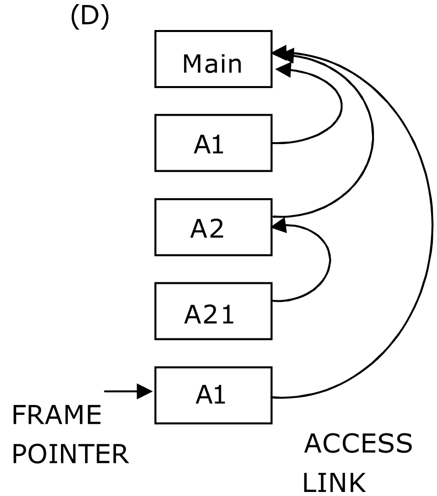
(B)



(C)



(D)



Answer:-(D)

Exp:- Access link is defined as link to activation record of closest lexically enclosing block in program text, so the closest enclosing blocks respectively for A1 ,A2 and A21 are main , main and A2

38. Suppose a circular queue of capacity (n – 1) elements is implemented with an array of *n* elements. Assume that the insertion and deletion operations are carried out using REAR and FRONT as array index variables, respectively. Initially, REAR = FRONT = 0. The conditions to detect queue full and queue empty are

(A) *full:* (REAR+1) mod n==FRONT
empty: REAR ==FRONT

(B) *full:*(REAR+1)mod n==FRONT
empty: (FRONT+1)mod n==REAR

(C) *full:* REAR==FRONT
empty: (REAR+1) mod n ==FRONT

(D) *full:*(FRONT+1)mod n==REAR
empty: REAR ==FRONT

Answer:- (A)

Exp:- The ***counter example*** for the condition *full* : REAR = FRONT is

Initially when the Queue is empty REAR=FRONT=0 by which the above *full* condition is satisfied which is false

The ***counter example*** for the condition *full* : (FRONT+1)mod n =REAR is

Initially when the Queue is empty REAR=FRONT=0 and let n=3, so after inserting one element REAR=1 and FRONT=0, at this point the condition *full* above is satisfied, but still there is place for one more element in Queue, so this condition is also false

The ***counter example*** for the condition *empty* : (REAR+1)mod n = FRONT is

Initially when the Queue is empty REAR=FRONT=0 and let n=2, so after inserting one element REAR=1 and FRONT=0, at this point the condition *empty* above is satisfied, but the queue of capacity n-1 is full here

The ***counter example*** for the condition *empty* : (FRONT+1)mod n =REAR is

Initially when the Queue is empty REAR=FRONT=0 and let n=2, so after inserting one element REAR=1 and FRONT=0, at this point the condition *empty* above is satisfied, but the queue of capacity n-1 is full here

39. An Internet Service Provider (ISP) has the following chunk of CIDR-based IP addresses available with it: 245.248.128.0/20. The ISP wants to give half of this chunk of addresses to Organization A, and a quarter to Organization B, while retaining the remaining with itself. Which of the following is a valid allocation of address to A and B?

(A) 245.248.136.0/21 and 245.248.128.0/22

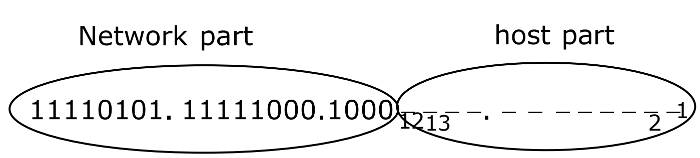
(B) 245.248.128.0/21 and 245.248.128.0/22

(C) 245.248.132.0/22 and 245.248.132.0/21

(D) 245.248.136.0/24 and 245.248.132.0/21

Answer:- (A)

Exp:-



Since half of 4096 host addresses must be given to organization A, we can set 12^{th} bit to 1 and include that bit into network part of organization A, so the valid allocation of addresses to A is 245.248.136.0/21

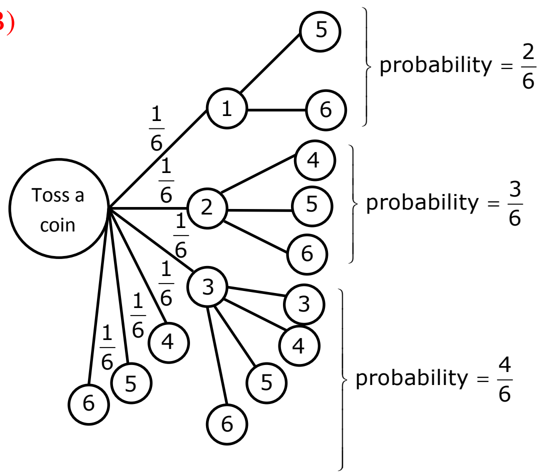
Now for organization B, 12^{th} bit is set to '0' but since we need only half of 2048 addresses, 13^{th} bit can be set to '0' and include that bit into network part of organization B so the valid allocation of addresses to B is 245.248.128.0/22

40. Suppose a fair six-sided die is rolled once. If the value on the die is 1, 2, or 3, the die is rolled a second time. What is the probability that the sum total of values that turn up is at least 6?

(A) 10/21 (B) 5/12 (C) 2/3 (D) 1/6

Answer:- (B)

Exp:-



$$\therefore \text{Required probability} = \frac{1}{6}\times\frac{2}{6}+\frac{1}{6}\times\frac{3}{6}+\frac{1}{6}\times\frac{4}{6}+\frac{1}{6}=\frac{15}{36}=\frac{5}{12}$$

41. Fetch_And_Add (X, i) is an atomic Read-Modify-Write instruction that reads the value of memory location X, increments it by the value i, and returns the old value of X. It is used in the pseudocode shown below to implement a busy-wait lock. L is an unsigned integer shared variable initialized to 0. The value of 0 corresponds to lock being available, while any non-zero value corresponds to the lock being not available.

```
AcquireLock(L){
    While (Fetch_And_Add(L,1))
                L = 1;
}
Release Lock(L){
    L = 0;
}
```

This implementation

(A) fails as L can overflow

(B) fails as L can take on a non-zero value when the lock is actually available

(C) works correctly but may starve some processes

(D) works correctly without starvation

Answer:- (B)

Exp:- 1. Acquire lock (L) {

2. While (Fetch_And_Add(L, 1))

3. L = 1.

}

4. Release Lock (L) {

5. L = 0;

6. }

Let P and Q be two concurrent processes in the system currently executing as follows

P executes 1,2,3 then Q executes 1 and 2 then P executes 4,5,6 then L=0 now Q executes 3 by which L will be set to 1 and thereafter no process can set

L to zero, by which all the processes could starve.

42. Consider the 3 process, P1, P2 and P3 shown in the table.

Process	Arrival time	Time units Required
P1	0	5
P2	1	7
P3	3	4

The completion order of the 3 processes under the policies FCFS and RR2 (round robin scheduling with CPU quantum of 2 time units) are

(A) **FCFS:** P1, P2, P3 **RR2:** P1, P2, P3

(B) **FCFS:** P1, P3, P2 **RR2:** P1, P3, P2

(C) **FCFS:** P1, P2, P3 **RR2:** P1, P3, P2

(D) **FCFS:** P1, P3, P2 **RR2:** P1, P2, P3

Answer:-(C)

Exp:- For FCFS Execution order will be order of Arrival time so it is P1,P2,P3

Next For RR with time quantum=2,the arrangement of Ready Queue will be as follows:

RQ: P1,P2,P1,P3,P2,P1,P3,P2

This RQ itself shows the order of execution on CPU(Using Gantt Chart) and here it gives the completion order as P1,P3,P2 in Round Robin algorithm.

43. What is the minimal form of the Karnaugh map shown below? Assume that X denotes a don't care term.

cd \ ab	00	01	11	10
00	1	X	X	1
01	X			1
11				
10	1			X

(A) $\bar{b}\bar{d}$
(B) $\bar{b}\bar{d}+\bar{b}\bar{c}$
(C) $\bar{b}\bar{d}+a\bar{b}\bar{c}d$
(D) $\bar{b}\bar{d}+\bar{b}\bar{c}+\bar{c}\bar{d}$

Answer:- (B)

Exp:-

cd \ ab	00	01	11	10
00	1	X		1
01	X			1
11				
10	1			X

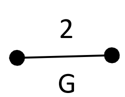
$d'b'+c'b'$

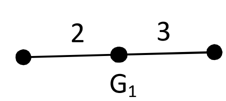
44. Let G be a weighted graph with edge weights greater than one and G' be the graph constructed by squaring the weights of edges in G. Let T and T' be the minimum spanning trees of G and G' respectively, with total weights t and t'. Which of the following statements is **TRUE**?

(A) T' = T with total weight $t' = t^2$
(B) T' = T with total weight $t' < t^2$
(C) T' $\neq$ T but total weight $t' = t^2$
(D) None of these

Answer:-(D)

Exp:-





Graph G is counter example for options (B) and (C) and Graph G_1 is counter example for option (A)

45. The bisection method is applied to compute a zero of the function $f(x) = x^4 - x^3 - x^2 - 4$ in the interval [1,9]. The method converges to a solution after ______ iterations.

(A) 1 (B) 3 (C) 5 (D) 7

Answer:- (B)

Exp:-

$$f(x) = x^4 - x^3 - x^2 - 4$$

$$f(1) < 0 \text{ and } f(9) > 0 \therefore x_0 = \frac{1+9}{2} = 5$$

$$f(5) > 0 \quad \therefore \text{ root lies in } [1,5]$$

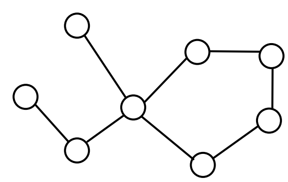
$$x_1 = \frac{1+5}{2} = 3$$

$$f(3) > 0 \therefore \text{ root lies in } [1,3]$$

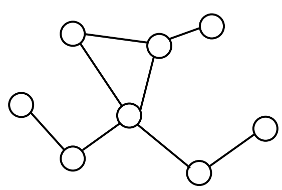
$$x_2 = \frac{1+3}{2} = 2$$

$$f(2) = 0 \therefore \text{ root is } 2$$

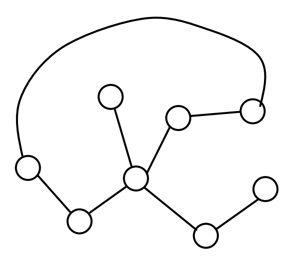
46. Which of the following graph is isomorphic to



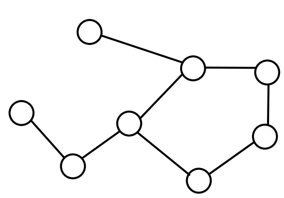
(A)



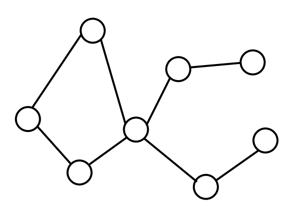
(B)



(C)



(D)



Answer:-(B)

Exp:- The graph in option (A) has a 3 length cycle whereas the original graph does not have a 3 length cycle

The graph in option (C) has vertex with degree 3 whereas the original graph does not have a vertex with degree 3

The graph in option (D) has a 4 length cycle whereas the original graph does not have a 4 length cycle

47. Consider the following transactions with data items P and Q initialized to zero:

T_1 : read (P) ;
read (Q) ;
if P = 0 then Q : = Q + 1 ;
write (Q).

T_2 : read (Q) ;
read (P)
if Q = 0 then P : = P + 1 ;
write (P).

Any non-serial interleaving of T1 and T2 for concurrent execution leads to

(A) a serializable schedule

(B) a schedule that is not conflict serializable

(C) a conflict serializable schedule

(D) a schedule for which precedence graph cannot be drawn

Answer:-(B)

Exp:- Let S be a non-serial schedule, without loss of generality assume that T1 has started earlier than T2. The first instruction of T1 is read(P) and the last instruction of T2 is write(P), so the precedence graph for S has an edge from T1 to T2, now since S is a non-serial schedule the first instruction of T2(read(Q)) should be executed before last instruction of T1(write(Q)) and since read and write are conflicting operations, the precedence graph for S also contains an edge from T2 to T1, So we will have a cycle in the precedence graph which implies that any non serial schedule with T1 as the earliest transaction will not be conflict serializable.

In a similar way we can show that if T2 is the earliest transaction then also the schedule is not conflict serializable.

Common Data Questions: 48 & 49

Consider the following relations A, B and C:

A

Id	**Name**	**Age**
12	Arun	60
15	Shreya	24
99	Rohit	11

B

Id	**Name**	**Age**
15	Shreya	24
25	Hari	40

98	Rohit	20
99	Rohit	11

C

Id	Phone	Area
10	220	02
99	2100	01

48. How many tuples does the result of the following SQL query contain?

SELECT A.Id
FROM A
WHERE A.Age > **ALL**(**SELECT** B.Age
FROM B
WHERE B.Name = 'Arun')

(A) 4 (B) 3 (C) 0 (D) 1

Answer:-(B)

Exp:- As the result of subquery is an empty table, '>ALL' comparison is true . Therefore, all the three row id's of A will be selected from table A.

49. How many tuples does the result of the following relational algebra expression contain? Assume that the schema of $A \cup B$ is the same as that of A.

$$(A \cup B) \bowtie_{A.Id>40 \vee C.Id<15} C$$

(A) 7 (B) 4 (C) 5 (D) 9

Answer:-(A)

Exp:- The final table is

AUB . Id	Name	Age	C.Id	Phone	Area
12	Arun	60	10	2200	02
15	Shreya	24	10	2200	02
25	Hari	40	10	2200	02
98	Rohit	20	10	2200	02
98	Rohit	20	99	2100	01
99	Rohit	11	10	2200	02
99	Rohit	11	99	2100	01

Common Data Questions: 50 & 51

Consider the following C code segment:

```
int a,   b,  c = 0;
void prtFun(void);
```

```
main( )
{       static int  a = 1;              /* Line 1 */
         prtFun( );
        a + = 1;
         prtFun( )
        printf("\n %d %d ", a, b);
}

void prtFun(void)
{       static int a=2;                 /* Line 2 */
        int b=1;
        a+=++b;
        printf("\n %d %d ", a, b);
}
```

50. What output will be generated by the given code segment if:
Line 1 is replaced by **auto int a = 1**;
Line 2 is replaced by **register int a = 2**;

(A)	(B)	(C)	(D)
3 1	4 2	4 2	4 2
4 1	6 1	6 2	4 2
4 2	6 1	2 0	2 0

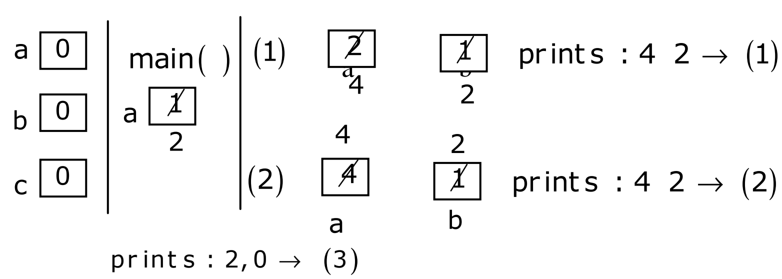
Answer:-(D)

Exp:- **Static local variables:** Scope is limited to function/block but life time is entire program.

Automatic local variables:

Storage allocated on function entry and automatically deleted or freed when the function is exited.

Register variables: Same as automatic variables except that the register variables will not have addresses Hence may not take the address of a register variable.

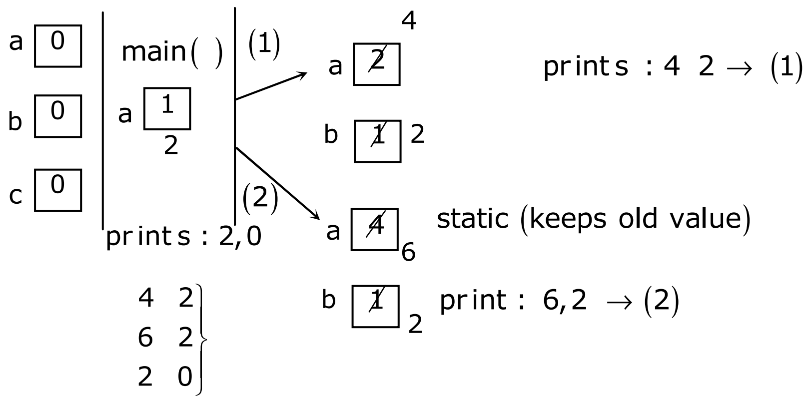


51. What output will be generated by the given code segment?

(A)	(B)	(C)	(D)
3 1	4 2	4 2	3 1
4 1	6 1	6 2	5 2
4 2	6 1	2 0	5 2

Answer:- (C)

Exp:-



Linked Answer Questions: Q.52 to Q.55 Carry Two Marks Each

Statement for Linked Answer Questions: 52 & 53

A computer has a 256 KByte, 4-way set associative, write back data cache with block size of 32 Bytes. The processor sends 32 bit addresses to the cache controller. Each cache tag directory entry contains, in addition to address tag, 2 valid bits, 1 modified bit and 1 replacement bit.

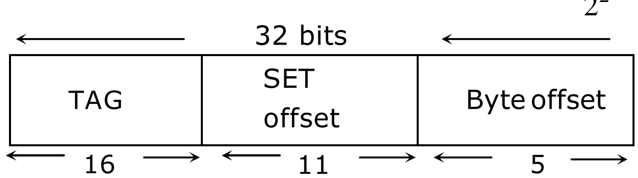
52. The number of bits in the tag field of an address is

(A) 11 (B) 14 (C) 16 (D) 27

Answer:- (C)

Exp:- Number of blocks $= \dfrac{256\,\text{KB}}{32\,\text{Bytes}} = \dfrac{2^{18}}{2^5} = 2^{13}$ blocks

As it is 4–way set associative, number of sets $= \dfrac{2^{13}}{2^2} = 2^{11}$



53. The size of the cache tag directory is

(A) 160 Kbits (B) 136 Kbits (C) 40 Kbits (D) 32 Kbits

Answer:-(A)

Exp:- TAG controller maintains 16 + 4 = 20 bits for every block

Hence, size of cache tag directory $= 20 \times 2^{13}$ bits $= 160$ K bits

Statement for Linked Answer Questions: 54 & 55

For the grammar below, a partial LL(1) parsing table is also presented along with the grammar. Entries that need to be filled are indicated as **E1, E2, and E3**. ε is the empty string, \$ indicates end of input, and | separates alternate right hand sides of productions.

$S \to a\,A\,b\,B \mid b\,A\,a\,B \mid \varepsilon$

$A \to S$

$B \to S$

	a	b	\$
S	**E1**	**E2**	$S \to \varepsilon$
A	$A \to S$	$A \to S$	error
B	$B \to S$	$B \to S$	**E3**

54. The First and Follow sets for the non-terminals A and B are

(A) FIRST(A) = {a, b, ε } = FIRST (B)
FOLLOW(A) = {a, b}
FOLLOW(B) = {a, b, \$}

(B) FIRST(A) = {a, b, \$}
FIRST(B) = {a, b, ε }
FOLLOW(A) = {a, b}
FOLLOW(B) ={\$}

(C) FIRST(A) = {a, b, ε } = FIRST(B)
FIRST(A) = {a, b}
FOLLOW(B) = $\varnothing$

(D) FIRST(A) = {a, b,} = FIRST(B)
FIRST(A) = {a, b}
FOLLOW(B) ={a, b}

Answer:- (A)

Exp:- $\text{First}(A) = \text{First}(S) = \text{First}(aAbB) \cup \text{First}(bAaB) \cup \text{First}(\in)$

$= \{a\} \cup \{b\} \cup \{\in\} = \{\in, a, b\}$

$\text{First}(B) = \text{First}(S) = \{\in, a, b\}$

$\text{Follow}(A) = \text{First}(bB) \cup \text{First}(aB) = \{a, b\}$

$\text{Follow}(B) = \text{Follow}(S) = \{\$\} \cup \text{Follow}(A) = \{\$, a, b\}$

55. The appropriate entries for E1, E2, and E3 are

(A) E1: $S \rightarrow aAbB,\ A \rightarrow S$
E2: $S \rightarrow bAaB,\ B \rightarrow S$
E3: $B \rightarrow S$

(B) E1: $S \rightarrow aAbB,\ S \rightarrow \varepsilon$
E2: $S \rightarrow bAaB,\ S \rightarrow \varepsilon$
E3: $S \rightarrow \varepsilon$

(C) E1: $S \rightarrow aAbB,\ S \rightarrow \varepsilon$
E2: $S \rightarrow bAaB,\ S \rightarrow \varepsilon$
E3: $B \rightarrow S$

(D) E1: $A \rightarrow S,\ S \rightarrow \varepsilon$
E2: $B \rightarrow S,\ S \rightarrow \varepsilon$
E3: $B \rightarrow S$

Answer:- (C)

Exp:-

$\text{First}(S) = \{\in, a, b\},\ \text{Follow}(S) = \{\$, a, b\}$

	a	b	\$
S	$S \rightarrow aAbB$ $S \rightarrow \in$	$S \rightarrow bAaB$ $S \rightarrow \in$	$S \rightarrow \in$

$B \rightarrow S$ to be placed in LL(1) Parsing table as follows:-

$\text{First}(S) = \{\in, a, b\},\ \text{Follow}(B) = \{\$, a, b\}$

	a	b	\$
B	$B \rightarrow S$	$B \rightarrow S$	$B \rightarrow S$

Q. No. 56 – 60 Carry One Mark Each

56. The cost function for a product in a firm is given by $5q^2$, where q is the amount of production. The firm can sell the product at a market price of Rs.50 per unit. The number of units to be produced by the firm such that the profit is maximized is

(A) 5 (B) 10 (C) 15 (D) 25

Answer:- (A)

Exp:-

$P = 50q - 5q^2$

$\frac{dp}{dq} = 50 - 10q;\ \frac{d^2p}{dq^2} < 0$

$\therefore$ p is maximum at $50 - 10q = 0$ or, $q = 5$

Else check with options

57. Choose the most appropriate alternative from the options given below to complete the following sentence:

Suresh's dog is the one ________ was hurt in the stampede.

(A) that (B) which (C) who (D) whom

Answer:- (A)

58. Choose the grammatically **INCORRECT** sentence:

(A) They gave us the money back less the service charges of Three Hundred rupees.

(B) This country's expenditure is not less than that of Bangladesh.

(C) The committee initially asked for a funding of Fifty Lakh rupees, but later settled for a lesser sum.

(D) This country's expenditure on educational reforms is very less

Answer:-(D)

59. Which one of the following options is the closest in meaning to the word given below?

Mitigate

(A) Diminish (B) Divulge (C) Dedicate (D) Denote

Answer:- (A)

60. Choose the most appropriate alternative from the options given below to complete the following sentence:

Despite several __________ the mission succeeded in its attempt to resolve the conflict.

(A) attempts (B) setbacks (C) meetings (D) delegations

Answer:- (B)

Q. No. 61 – 65 Carry Two Marks Each

61. Wanted Temporary, Part-time persons for the post of Field Interviewer to conduct personal interviews to collect and collate economic data. Requirements: High School-pass, must be available for Day, Evening and Saturday work. Transportation paid, expenses reimbursed.

Which one of the following is the best inference from the above advertisement?

(A) Gender-discriminatory (B) Xenophobic

(C) Not designed to make the post attractive (D) Not gender-discriminatory

Answer:- (C)

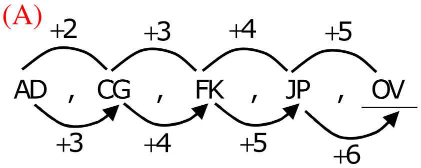
Exp:- Gender is not mentioned in the advertisement and (B) clearly eliminated

62. Given the sequence of terms, AD CG FK JP, the next term is

(A) OV (B) OW (C) PV (D) PW

Answer:- (A)

Exp:-



63. Which of the following assertions are CORRECT?

P: Adding 7 to each entry in a list adds 7 to the mean of the list

Q: Adding 7 to each entry in a list adds 7 to the standard deviation of the list

R: Doubling each entry in a list doubles the mean of the list

S: Doubling each entry in a list leaves the standard deviation of the list unchanged

(A) P, Q (B) Q, R (C) P, R (D) R, S

Answer:-(C)

Exp:- P and R always hold true

Else consider a sample set {1, 2, 3, 4} and check accordingly

64. An automobile plant contracted to buy shock absorbers from two suppliers X and Y. X supplies 60% and Y supplies 40% of the shock absorbers. All shock absorbers are subjected to a quality test. The ones that pass the quality test are considered reliable Of X's shock absorbers, 96% are reliable. Of Y's shock absorbers, 72% are reliable.

The probability that a randomly chosen shock absorber, which is found to be reliable, is made by Y is

(A) 0.288 (B) 0.334 (C) 0.667 (D) 0.720

Answer:-(B)

Exp:-

	x	y
Supply	60%	40%
Reliable	96%	72%
Overall	0.576	0.288

$$\therefore P(x) = \frac{0.288}{0.576 + 0.288} = 0.334$$

65. A political party orders an arch for the entrance to the ground in which the annual convention is being held. The profile of the arch follows the equation $y = 2x - 0.1x^2$ where y is the height of the arch in meters. The maximum possible height of the arch is

(A) 8 meters (B) 10 meters (C) 12 meters (D) 14 meters

Answer:-(B)

Exp:-

$$y = 2x - 0.1x^2$$

$$\frac{dy}{dx} = 2 - 0.2x$$

$$\frac{d^2y}{dx^2} < 0 \therefore y \text{ maximises at } 2 - 0.2x = 0$$

$$\Rightarrow x = 10$$

$$\therefore y = 20 - 10 = 10\text{m}$$

Q. No. 1 – 25 Carry One Mark Each

1. The simplified SOP (Sum of Product) form of the Boolean expression $\left(P+\overline{Q}+\overline{R}\right).\left(P+\overline{Q}+R\right).\left(P+Q+\overline{R}\right)$ is

(A) $\left(\overline{P}Q+\overline{R}\right)$ (B) $\left(P+\overline{Q}\,\overline{R}\right)$ (C) $\left(\overline{P}Q+R\right)$ (D) $\left(PQ+R\right)$

Answer: - (B)

Exp: -

P \ QR	00	01	11	10
0		1	1	1
1				

$$f=\left(P+\overline{R}\right)\left(P+\overline{Q}\right)$$

$$=P+\overline{Q}\,\overline{R}$$

Alternate method

$$\left(P+\overline{Q}+\overline{R}\right).\left(P+\overline{Q}+R\right).\left(P+Q+\overline{R}\right)=\overline{\overline{\left(P+\overline{Q}+\overline{R}\right).\left(P+\overline{Q}+R\right).\left(P+Q+\overline{R}\right)}}$$

$$=\overline{\overline{P}QR+\overline{P}Q\overline{R}+\overline{P}\,\overline{Q}R}=\overline{\overline{P}Q\left(R+\overline{R}\right)+\overline{P}\,\overline{Q}R}=\overline{\overline{P}Q+\overline{P}\,\overline{Q}R}=\overline{\overline{P}\left(Q+\overline{Q}R\right)}$$

$$=\overline{\overline{P}\left(Q+R\right)}=P+\overline{Q}\;\overline{R}$$

2. Which one of the following circuits is NOT equivalent to a 2-input XNOR (exclusive NOR) gate?

(A) 
(B) 
(C) 
(D) 
Answer: - (D)

Exp: - All options except option 'D' gives EX-NOR gates

3. The minimum number of D flip-flops needed to design a mod-258 counter is

(A) 9 (B) 8 (C) 512 (D) 258

Answer: - (A)

Exp: - $2^n \geq 258 \Rightarrow n=9$

4. A thread is usually defined as a 'light weight process' because an operating system (OS) maintains smaller data structures for a thread than for a process. In relation to this, which of the followings is TRUE?

(A) On per-thread basis, the OS maintains only CPU register state

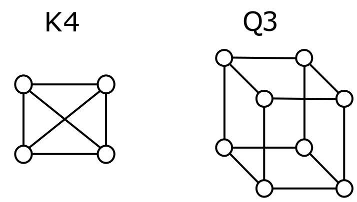
(B) The OS does not maintain a separate stack for each thread

(C) On per-thread basis, the OS does not maintain virtual memory state

(D) On per thread basis, the OS maintains only scheduling and accounting information

Answer: - (A)

5. K4 and Q3 are graphs with the following structures



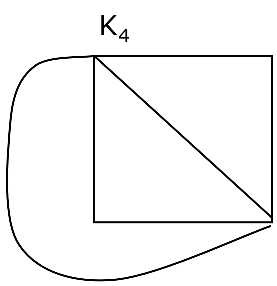
Which one of the following statements is TRUE in relation to these graphs?

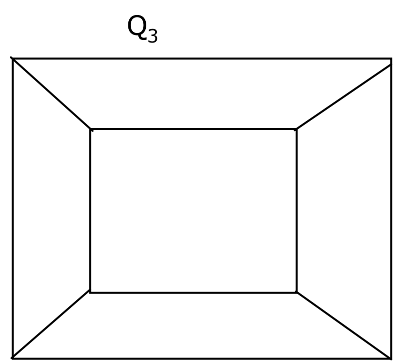
(A) K4 is planar while Q3 is not (B) Both K4 and Q3 are planar

(C) Q3 is planar while K4 is not (D) Neither K4 not Q3 is planar

Answer: - (B)

Exp: -





$\therefore$ Both K_4 and Q_3 are planar

6. If the difference between the expectation of the square of random variable $\left(E\left[X^2\right]\right)$ and the square of the expectation of the random variable $\left(E\left[X^2\right]\right)$ is denoted by R then

(A) $R = 0$ (B) $R<0$ (C) $R \geq 0$ (D) $R>0$

Answer: - (C)

7. The lexical analysis for a modern computer language such as Java needs the power of which one of the following machine models in a necessary and sufficient sense?

(A) Finite state automata

(B) Deterministic pushdown automata

(C) Non-Deterministic pushdown automata

(D) Turing machine

Answer: - (A)

Exp: - Lexical Analysis is implemented by finite automata

8. Let the page fault service time be 10ms in a computer with average memory access time being 20ns. If one page fault is generated for every 10^6 memory accesses, what is the effective access time for the memory?

(A) 21ns (B) 30ns (C) 23ns (D) 35ns

Answer: - (B)

Exp: - P = page fault rate

EA = p × page fault service time

$$+(1-p)\times \text{Memory access time}$$

$$=\frac{1}{10^6}\times 10\times 10^6+\left(1-\frac{1}{10^6}\right)\times 20 \cong 29.9\,\text{ns}$$

9. Consider a hypothetical processor with an instruction of type LW R1, 20(R2), which during execution reads a 32-bit word from memory and stores it in a 32-bit register R1. The effective address of the memory location is obtained by the addition of constant 20 and the contents of register R2. Which of the following best reflects the addressing mode implemented by this instruction for the operand in memory?

(A) Immediate Addressing (B) Register Addressing

(C) Register Indirect Scaled Addressing (D) Base Indexed Addressing

Answer: - (D)

Exp: - Here 20 will act as base and content of R_2 will be index

10. What does the following fragment of C-program print?

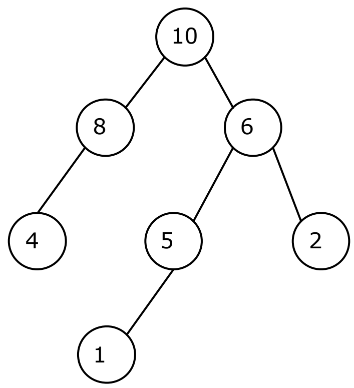
```
char c[ ] = "GATE2011";
char *p =c;
printf("%s", p+p[3]−p[1]);
```

(A) GATE2011 (B) E2011 (C) 2011 (D) 011

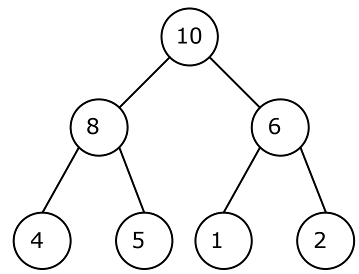
Answer: - (C)

11. A max-heap is a heap where the value of each parent is greater than or equal to the value of its children. Which of the following is a max-heap?

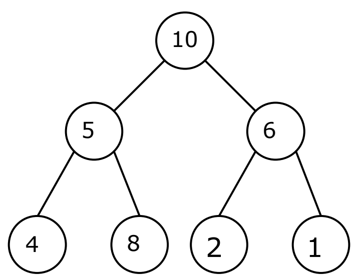
(A)



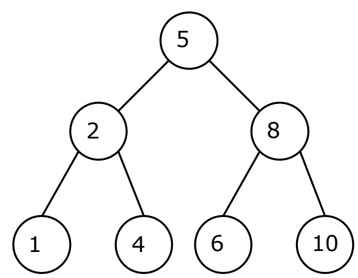
(B)



(C)



(D)



Answer: - (B)

Exp: - Heap is a complete binary tree

12. An algorithm to find the length of the longest monotonically increasing sequence of numbers in an array $A[0 : n-1]$ is given below.

Let L_i denote the length of the longest monotonically increasing sequence starting at index i in the array

Initialize $L_{n-1} = 1$

For all i such that $0 \le i \le n-2$

$$L_i = \begin{cases} 1 + L_{i+1} & \text{if } A[i] < A[i+1] \\ 1 & \text{Otherwise} \end{cases}$$

Finally the length of the longest monotonically increasing sequence is $\text{Max}(L_0, L_1, \ldots, L_{n-1})$. Which of the following statements is TRUE?

(A) The algorithm uses dynamic programming paradigm

(B) The algorithm has a linear complexity and uses branch and bound paradigm

(C) The algorithm has a non-linear polynomial complexity and uses branch and bound paradigm

(D) The algorithm uses divide and conquer paradigm.

Answer: - (A)

13. Let P be a regular language and Q be a context free language such that $Q \subseteq P$. (For example, let P be the language represented by the regular expression p*q* and Q be $\{p^n q^n \mid n \in N\}$). Then which of the following is ALWAYS regular?

(A) $P \cap Q$ (B) $P - Q$ (C) $\Sigma^* - P$ (D) $\Sigma^* - Q$

Answer: - (C)

Exp: - $\Sigma^* - P$ is the complement of P so it is always regular,

since regular languages are closed under complementation

14. In a compiler, keywords of a language are recognized during
    (A) parsing of the program (B) the code generation
    (C) the lexical analysis of the program (D) dataflow analysis

Answer: - (C)

Exp: - Any identifier is also a token so it is recognized in lexical Analysis

15. A layer-4 firewall (a device that can look at all protocol headers up to the transport layer) CANNOT
    (A) block entire HTTP traffic during 9:00PM and 5:00AM
    (B) block all ICMP traffic
    (C) stop incoming traffic from a specific IP address but allow outgoing traffic to the same IP address
    (D) block TCP traffic from a specific user on a multi-user system during 9:00PM and 5:00AM

Answer: - (A)

Exp: - Since it is a layer 4 firewall it cannot block application layer protocol like HTTP.

16. If two fair coins are flipped and at least one of the outcomes is known to be a head, what is the probability that both outcomes are heads?
    (A) 1/3 (B) 1/4 (C) 1/2 (D) 2/3

Answer: - (A)

Exp: - Sample space = $\{HH, HT, TH\}$

Required probability $= \frac{1}{3}$

17. Consider different activities related to email.
    m1: Send an email from a mail client to a mail server
    m2: Download an email from mailbox server to a mail client
    m3: Checking email in a web browser
    Which is the application level protocol used in each activity?
    (A) m1:HTTP m2:SMTP m3:POP (B) m1:SMTP m2:FTP m3:HTTP
    (C) m1: SMTP m2: POP m3: HTTP (D) m1: POP m2: SMTP m3:IMAP

Answer: - (C)

Exp: - Sending an email will be done through user agent and message transfer agent by SMTP, downloading an email from mail box is done through POP, checking email in a web browser is done through HTTP

18. A company needs to develop a strategy for software product development for which it has a choice of two programming languages L1 and L2. The number of lines of code (LOC) developed using L2 is estimated to be twice the LOC developed with L1. the product will have to be maintained for five years. Various parameters for the company are given in the table below.

Parameter	Language L1	Language L2
Man years needed for development	LOC / 10000	LOC / 10000
Development Cost per year	Rs. 10,00,000	Rs. 7,50,000
Maintenance time	5 years	5 years
Cost of maintenance per year	Rs. 1,00,000	Rs. 50,000

Total cost of the project includes cost of development and maintenance. What is the LOC for L1 for which the cost of the project using L1 is equal to the cost of the project using L2?

(A) 4000 (B) 5000 (C) 4333 (D) 4667

Answer: - (B)

Exp: - LOC $L_1 = x$

$L_2 = 2x$

Total cost of project

$$\frac{x}{10000}\times 1000000 + 5\times 100000 = \frac{2x}{10000}\times 750000 + 50000\times 5$$

$$100x + 500000 = 150x + 250000$$

$$\Rightarrow 50x = 500000 - 250000$$

$$\therefore \quad x = \frac{250000}{50} \Rightarrow x = 5000$$

19. Let the time taken to switch between user and kernel modes of execution be t_1 while the time taken to switch between two processes be t_2. Which of the following is TRUE?

(A) $t_1 > t_2$

(B) $t_1 = t_2$

(C) $t_1 < t_2$

(D) Nothing can be said about the relation between t_1 and t_2

Answer: - (C)

Exp: - Process switching also involves mode changing.

20. A company needs to develop digital signal processing software for one of its newest inventions. The software is expected to have 40000 lines of code. The company needs to determine the effort in person-months needed to develop this software using the basic COCOMO model. The multiplicative factor for this model is given as 2.8 for the software development on embedded systems, while the exponentiation factor is given as 1.20. What is the estimated effort in person-months?

(A) 234.25 (B) 932.50 (C) 287.80 (D) 122.40

Answer: - (A)

Exp: - Effort person per month

$= \alpha.(\text{kDSI})^{B}$

$\text{KDSI} = \text{Kilo LOC}$

$= 2.8 \times (40)^{1.20}$

$= 2.8 \times 83.6511$

$= 234.22$ person per month

21. Which of the following pairs have DIFFERENT expressive power?
    (A) Deterministic finite automata (DFA) and Non-deterministic finite automata (NFA)
    (B) Deterministic push down automata (DPDA) and Non-deterministic push down automata (NPDA)
    (C) Deterministic single-tape Turing machine and Non-deterministic single tape Turing machine
    (D) Single-tape Turing machine and multi-tape Turing machine

Answer: - (B)

Exp: - NPDA is more powerful than DPDA.

Hence answer is (B)

22. HTML (Hyper Text Markup Language) has language elements which permit certain actions other than describing the structure of the web document. Which one of the following actions is NOT supported by pure HTML (without any server or client side scripting) pages?
    (A) Embed web objects from different sites into the same page
    (B) Refresh the page automatically after a specified interval
    (C) Automatically redirect to another page upon download
    (D) Display the client time as part of the page

Answer: - (D)

23. Which of the following is NOT desired in a good Software Requirement Specifications (SRS) document?
    (A) Functional Requirements
    (B) Non Functional Requirements
    (C) Goals of Implementation
    (D) Algorithms for Software Implementation

Answer: - (D)

24. A computer handles several interrupt sources of which the following are relevant for this question.

    Interrupt from CPU temperature sensor

    Interrupt from Mouse

Interrupt from Keyboard

Interrupt from Hard Disk

(A) Interrupt from Hard Disk (B) Interrupt from Mouse

(C) Interrupt from Keyboard (D) Interrupt from CPU temp sensor

Answer: - (D)

25. Consider a relational table with a single record for each registered student with the following attributes.

1. Registration_Number: Unique registration number for each registered student
2. UID: Unique Identity number, unique at the national level for each citizen
3. BankAccount_Number: Unique account number at the bank. A student can have multiple accounts or joint accounts. This attributes stores the primary account number
4. Name: Name of the Student
5. Hostel_Room: Room number of the hostel

Which of the following options is INCORRECT?

(A) BankAccount_Number is a candidate key

(B) Registration_Number can be a primary key

(C) UID is a candidate key if all students are from the same country

(D) If S is a superkey such that $S \cap UID$ is NULL then $S \cup UID$ is also a superkey

Answer: - (A)

Exp: - In case two students hold joint account then BankAccount_Num will not uniquely determine other attributes.

Q. No. 26 – 51 Carry Two Marks Each

26. Which of the given options provides the increasing order of asymptotic complexityoffunctionsf_1,f_2,$f_3$andf_4?

$f_1(n) = 2^n;\ f_2(n) = n^{3/2};\ f_3(n) = n\log_2 n;\ f_4(n) = n^{\log_2 n}$

(A) f_3, f_2, f_4,f_1 (B) f_3, f_2, f_1,f_4 (C) f_2, f_3, f_1,f_4 (D) f_2, f_3, f_4,f_1

Answer: - (A)

Let $n = 1024$

$$f_1(n) = 2^{1024}$$

$$f_2(n) = 2^{15}$$

$$f_3(n) = 10 \times 2^{10}$$

$$f_4(n) = 1024^{10} = 2^{100}$$

$\therefore f_3, f_2, f_4, f_1$ is the rquired increasing order

27. Four matrices M_1, M_2, M_3 and M_4 are dimensions $p \times q$, $q \times r$, $r \times s$ and $s \times t$ respectively can be multiplied in several ways with different number of total scalar multiplications. For example When multiplied as $((M_1 \times M_2) \times (M_3 \times M_4))$ the total number of scalar multiplications is pqr+rst+prt. When multiplied as $(((M_1 \times M_2) \times M_3) \times M_4)$, the total number of scalar multiplications is pqr+prs+pst.

If p=10, q=100, r=20, s=5 and t=80, then the minimum number of scalar multiplications needed is

(A) 248000 (B) 44000 (C) 19000 (D) 25000

Answer: - (C)

Exp: - Multiply as $(M_1 \times (M_2 \times M_3)) \times M_4$

The total number of scalar multiplication is

$= qrs + pqs + pst$

$= 10000 + 5000 + 4000 = 19000$

28. Consider a relational table r with sufficient number of records, having attributes A_1, A_2,..., A_n and let $1 \le p \le n$. Two queries Q1 and Q2 are given below.

Q1 : $\pi_{A1...A_n}\left(\sigma_{A_p=c}(r)\right)$ where c is a const

Q2: $\pi_{A1...A_n}\left(\sigma_{c_1 \le A_p \le c_2}(r)\right)$ where c_1 and c_2 are constants

The database can be configured to do ordered indexing on A_p or hashing on A_p. Which of the following statements is TRUE?

(A) Ordered indexing will always outperform hashing for both queries

(B) Hashing will always outperform ordered indexing for both queries

(C) Hashing will outperform ordered indexing on Q1, but not on Q2

(D) Hashing will outperform ordered indexing on Q2, but not on Q1.

Answer: - (C)

29. Consider the matrix as given below.

$$\begin{bmatrix} 1 & 2 & 3 \\ 0 & 4 & 7 \\ 0 & 0 & 3 \end{bmatrix}$$

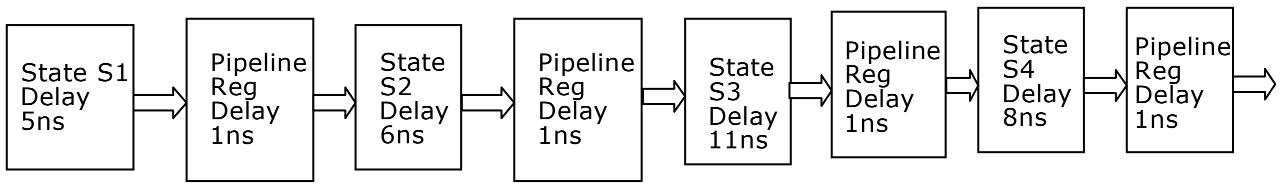
Which one of the following provides the CORRECT values of eigenvalues of the matrix?

(A) 1,4,3 (B) 3,7,3 (C) 7,3,2 (D) 1,2,3

Answer: - (A)

Exp: - Given matrix is upper triangular matrix and its diagonal elements are its eigen values = 1, 4, 3

30. Consider an instruction pipeline with four stages (S1, S2, S3 and S4) each with combinational circuit only. The pipeline registers are required between each stage and at the end of the last stage. Delays for the stages and for the pipeline registers are as given in the figure.



What is the approximate speed up of the pipeline in steady state under ideal conditions when compared to the corresponding non-pipeline implementation?

(A) 4.0 (B) 2.5 (C) 1.1 (D) 3.0

Answer: - (B)

Exp: - $\frac{(5+6+11+8)}{(11+1)} = \frac{30}{12} = 2.5$

31. Definition of a language L with alphabet $\{a\}$ is given as following

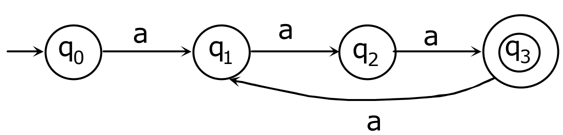
$L = \{a^{nk} \mid k > 0, \text{ and } n \text{ is a positive integer constant}\}$

What is the minimum number of states needed in a DFA to recognize L?

(A) k+1 (B) n+1 (C) 2^{n+1} (D) 2^{k+1}

Answer: - (B)

Exp: - Let n = 3 and k=1



$(n+1)$ states

32. An 8KB direct mapped write-back cache is organized as multiple blocks, each of size 32-bytes. The processor generates 32-bit addresses. The cache controller maintains the tag information for each cache block comprising of the following.

1 Valid bit

1 Modified bit

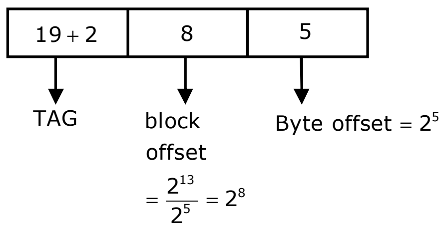
As many bits as the minimum needed to identify the memory block mapped in the cache.

What is the total size of memory needed at the cache controller to store meta-data (tags) for the cache?

(A) 4864 bits (B) 6144bits (C) 6656bits (D) 5376bits

Answer: - (D)

Exp: -



Required answer $= 256 \times (19+2) = 5376$ bits

33. An application loads 100 libraries at startup. Loading each library requires exactly one disk access. The seek time of the disk to a random location is given as 10ms. Rotational speed of disk is 6000rpm. If all 100 libraries are loaded from random locations on the disk, how long does it take to load all libraries? (The time to transfer data from the disk block once the head has been positioned at the start of the block may be neglected)

(A) 0.50s (B) 1.50s (C) 1.25s (D) 1.00s

Answer: - (B)

Exp: - 6000 rotations ________ 60 sec

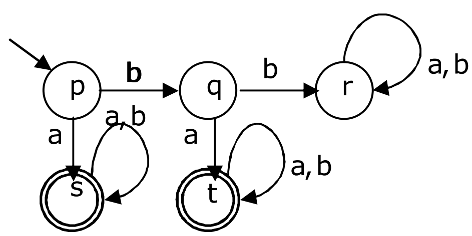
1 rotation ________ 10 ms

$\therefore$ Rotational latency = 5ms

Time for one disk access = 15 ms

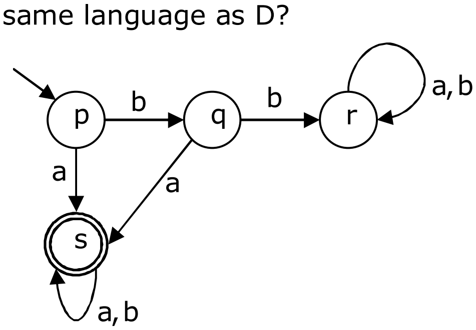
Time to load all libraries $= 15 \times 100 = 1500\,\text{ms} = 1.5\,\text{sec}$

34. A deterministic finite automation $(\text{DFA})\,D$ with alphabet $\Sigma = \{a, b\}$ is given below

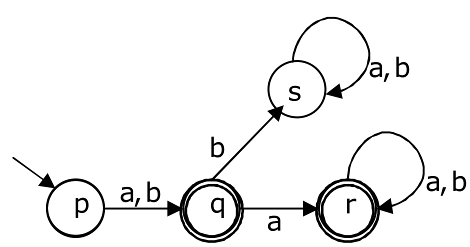


Which of the following finite state machines is a valid minimal DFA which accepts the same language as D?

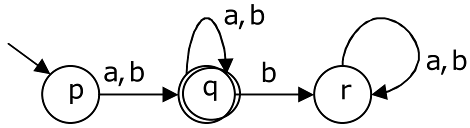
(A)



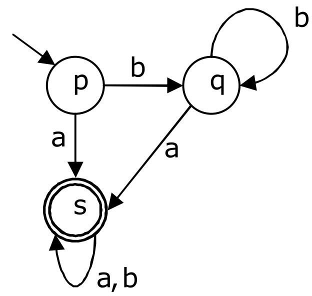
(B)



(C)



(D)



Answer: - (A)

Exp: - Options B and C will accept the string b

Option – D will accept the string "bba"

Both are invalid strings.

So the minimized DFA is option A

35. The following is comment written for a C function

/* This function computes the roots of a quadratic equation
a.x^2+b.x+c=0. The function stores two real roots
in *root1 and *root2 and returns the status of validity of
roots. It handles four different kinds of cases.
(i) When coefficient a is zero irrespective of discriminant
(ii) When discriminant is positive
(iii) When discrimanant is zero
(iv) When discrimanant is negative
Only in cases (ii) and (iii), the stored roots are valid.
Otherwise 0 is stored in the roots. the function returns 0 when
the roots are valid and -1 otherwise.
The functin also ensures root1>=root2.
int get_QuadRoots(float a, float b, float c, float *root1, float *root2);
*/

A software test engineer is assigned the job of doing black box testing. He comes up with the following test cases, many of which are redundant.

Test Case	Input set			Expected Output set		
	a	b	C	Root1	Root2	Return Value
T1	0.0	0.0	7.0	0.0	0.0	-1
T2	0.0	1.0	3.0	0.0	0.0	-1
T3	1.0	2.0	1.0	-1.0	-1.0	0
T4	4.0	-12.0	9.0	1.5	1.5	0
T5	1.0	-2.0	-3.0	3.0	-1.0	0
T6	1.0	1.0	4.0	0.0	0.0	-1

Which one of the following options provide the set of non-redundant tests using equivalence class partitioning approach from input perspective for black box testing?

(A) T1,T2,T3,T6 (B) T1,T3,T4,T5 (C) T2,T4,T5,T6 (D) T2,T3,T4,T5

Answer: - (C)

Exp: - T_1 and T_2 checking same condition a = 0 hence, any one of T_1 and T_2 is redundant.

T_3, T_4: in both case discriminant $(D)=b^2-4ac=0$. Hence any one of it is redundant.

T_5 : D>0

T_6 : D<0

36. Database table by name Loan_Records is given below.

Borrower	**Bank_Manager**	**Loan_ Amount**
Ramesh	Sunderajan	10000.00
Suresh	Ramgopal	5000.00
Mahesh	Sunderajan	7000.00

What is the output of the following SQL query?

```
SELECT count(*)
FROM(
(SELECT Borrower. Bank_Manager FROM Loan_Records) AS S
NATURAL JOIN
(SELECT Bank_Manager, Loan_Amount FROM Loan_Records) AS T
);
```

(A) 3 (B) 9 (C) 5 (D) 6

Answer: - (C)

Exp: -

S

Borrower	Bank_Manager
Ramesh	Sunderajan
Suresh	Ramgqpal
Mahesh	Sunderjan

T

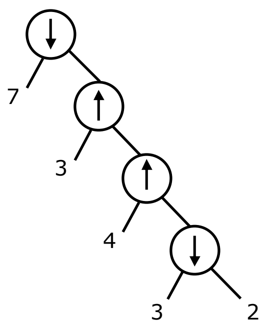
Bank_Manager	Loan_Amount
Sunderajan	10000.00
Ramgopal	5000.00
Sunderjan	7000.00

After executing the given query, the output would be

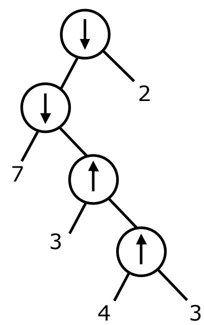
Borrower	**Bank_Manager**	**Load_Amount**
Ramesh	Sunderajan	10000.00
Ramesh	Sunderajan	7000.00
Suresh	Ramgopal	5000.00
Mahesh	Sunderajan	10000.00
Mahesh	Sunderajan	7000.00

37. Consider two binary operators '$\uparrow$' and '$\downarrow$' with the precedence of operator $\downarrow$ being lower than that of the operator $\uparrow$. Operator $\uparrow$ is right associative while operator $\downarrow$, is left associative. Which one of the following represents the parse tree for expression $(7 \downarrow 3 \uparrow 4 \uparrow 3 \downarrow 2)$?

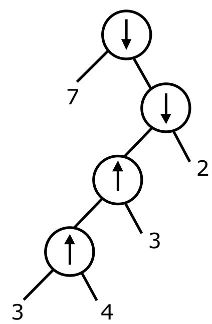
(A)



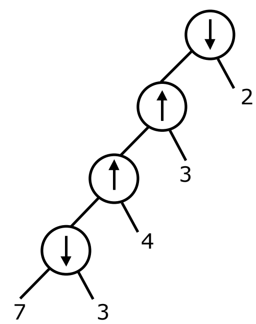
(B)



(C)



(D)



Answer: - (B)

Exp: - $7 \downarrow 3 \uparrow 4 \uparrow 3 \downarrow 2$

$\Rightarrow 7 \downarrow 3 \uparrow (4 \uparrow 3) \downarrow 2$ as $\uparrow$ is right associative

$\Rightarrow 7 \downarrow (3 \uparrow (4 \uparrow 3)) \downarrow 2$

$\Rightarrow (7 \downarrow (3 \uparrow (4 \uparrow 3))) \downarrow 2$ as $\downarrow$ is left associative

38. Consider the languages L1, L2 and L3 as given below

$L1 = \{0^p 1^q \mid p, q \in N\}$

$L2 = \{0^p 1^q \mid p, q \in N \text{ and } p = q\}$ and

$L3 = \{0^p 1^q 0^r \mid p, q, r \in N \text{ and } p = q = r\}$

Which of the following statements is NOT TRUE?

(A) Push Down Automata (PDA) can be used to recognize L1 and L2

(B) L1 is a regular language

(C) All the three languages are context free

(D) Turing machines can be used to recognize all the languages

Answer: - (C)

Exp: - L1: regular language

L2: context free language

L3: context sensitive language

39. On a non-pipelined sequential processor, a program segment, which is a part of the interrupt service routine, is given to transfer 500 bytes from an I/O device to memory.

Initialize the address register

Initialize the count to 500

LOOP: Load a byte from device

Store in memory at address given by address register

Increment the address register

Decrement the count

If count != 0 go to LOOP

Assume that each statement in this program is equivalent to a machine instruction which takes one clock cycle to execute if it is a non-load/store instruction. The load-store instructions take two clock cycles to execute.

The designer of the system also has an alternate approach of using the DMA controller to implement the same transfer. The DMA controller requires 20 clock cycles for initialization and other overheads. Each DMA transfer cycle takes two clock cycles to transfer one byte of data from the device to the memory.

What is the approximate speedup when the DMA controller based design is used in place of the interrupt driven program based input-output?

(A) 3.4 (B) 4.4 (C) 5.1 (D) 6.7

Answer: - (A)

Exp: - No. of clock cycles required by using load-store approach = 2 + 500 × 7 = 3502 and that of by using DMA = 20 + 500 × 2 = 1020

Required speed up $= \frac{3502}{1020} = 3.4$

40. We are given a set of n distinct elements and an unlabeled binary tree with n nodes. In how many ways can we populate the tree with the given set so that it becomes a binary search tree?

(A) 0 (B) 1 (C) n! (D) $\frac{1}{n+1} . {}^{2n}C_n$

Answer: - (D)

41. Which one of the following options is CORRECT given three positive integers x, y and z, and a predicate

$P(x) = \neg(x = 1) \wedge \forall y \left(\exists z (x = y * z) \Rightarrow (y = x) \vee (y = 1)\right)$

(A) P(x) being true means that x is a prime number

(B) P(x) being true means that x is a number other than 1

(C) P(x) is always true irrespective of the value of x

(D) P(x) being true means that x has exactly two factors other than 1 and x

Answer: - (A)

42. Given $i = \sqrt{-1}$, what will be the evaluation of the definite integral $\int_0^{\pi/2} \frac{\cos x + i \sin x}{\cos x - i \sin x} dx$?

(A) 0 (B) 2 (C) $-i$ (D) i

Answer: - (D)

Exp: - $\int_0^{\pi/2} \frac{e^{ix}}{e^{-ix}} dx = \int_0^{\pi/2} e^{2ix} dx$

$$= \left(\frac{e^{2ix}}{2i}\right)_0^{\pi/2} = \frac{1}{2i}\left[e^{i\pi} - 1\right] = \frac{1}{2i}\left[\cos\pi + i\sin\pi - 1\right] = \frac{1}{2i}\left[-1 + 0 - 1\right] = \frac{-2}{2i} = \frac{-1}{i} \times \frac{i}{i} = \frac{-i}{-1} = i$$

43. Consider a database table T containing two columns X and Y each of type integer. After the creation of the table, one record (X= 1, Y=l) is inserted in the table.

Let MX and MY denote the respective maximum values of X and Y among all records in the table at any point in time. Using MX and MY, new records are inserted in the table 128 times with X and Y values being MX+1, 2*MY+1 respectively. It may be noted that each time after the insertion, values of MX and MY change.

What will be the output of the following SQL query after the steps mentioned above are carried out?

SELECT Y FROM T WHERE X=7;

(A) 127 (B) 255 (C) 129 (D) 257

Answer: - (A)

Exp: -

X	Y
1	1
2	3
3	7
4	15
5	31
6	63
7	127

44. Consider a finite sequence of random values $X = [x_1, x_2, ... x_n]$. Let μ_x be the mean and σ_x be the standard deviation of X .Let another finite sequence Y of equal length be derived from this as $y_i = a * x_i + b$, where a and b are positive constants. Let μ_y be the mean and σ_y be the standard deviation of this sequence. Which one of the following statements is INCORRECT?

(A) Index position of mode of X in X is the same as the index position of mode of Y in Y.

(B) Index position of median of X in X is the same as the index position of median of Y in Y.

(C) $\mu_y = a\mu_x + b$

(D) $\sigma_y = a\sigma_x + b$

Answer: - (D)

45. A deck of 5 cards (each carrying a distinct number from 1 to 5) is shuffled thoroughly. Two cards are then removed one at a time from the deck. What is the probability that the two cards are selected with the number on the first card being one higher than the number on the second card?

(A) 1/5 (B) 4/25 (C) 1/4 (D) 2/5

Answer: - (A)

Exp: - (2,1), (3,2), (4,3), (5,4)

Required probability $= \frac{4}{5 \times 4} = \frac{4}{20} = \frac{1}{5}$

46. Consider the following table of arrival time and burst time for three processes P0, P1 and P2.

Process	**Arrival time**	**Burst Time**
P0	0 ms	9 ms
P1	1 ms	4ms
P2	2 ms	9ms

The pre-emptive shortest job first scheduling algorithm is used. Scheduling is carried out only at arrival or completion of processes. What is the average waiting time for the three processes?

(A) 5.0 ms (B) 4.33 ms (C) 6.33 ms (D) 7.33 ms

Answer: - (A)

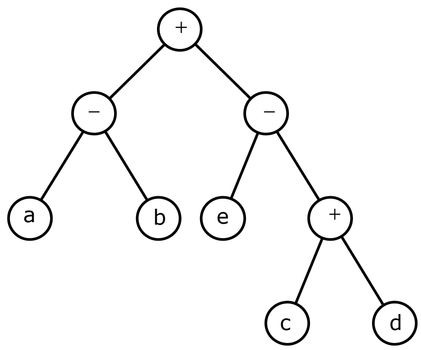
Exp: -

P_0	P_1	P_0	P_2

0 1 5 13 22

Average waiting time $= \dfrac{4+11}{3} = 5$ ms

47. Consider evaluating the following expression tree on a machine with load-store architecture in which memory can be accessed only through load and store instructions. The variables a, b, c, d and e are initially stored in memory. The binary operators used in this expression tree can be evaluated by the machine only when the operands are in registers. The instructions produce result only in a register. If no intermediate results can be stored in memory, what is the minimum number of registers needed to evaluate this expression?



(A) 2 (B) 9 (C) 5 (D) 3

Answer: - (D)

Exp: - Load R_1, a ; $R_1 \leftarrow M[a]$

Load R_2, b ; $R_2 \leftarrow M[b]$

Sub R_1, R_2 ; $R_1 \leftarrow R_1 - R_2$

Load R_2, c ; $R_2 \leftarrow M[c]$

Load R_3, d ; $R_3 \leftarrow M[d]$

Add R_2, R_3 ; $R_2 \leftarrow R_2 + R_3$

Load R_3, e ; $R_3 \leftarrow M[e]$

Sub R_3, R_2 : $R_3 \leftarrow R_3 - R_2$

Add R_1, R_3 ; $R_1 \leftarrow R_1 + R_3$

Total 3 Registers are required minimum

Common Data Questions: 48 & 49

Consider the following recursive C function that takes two arguments

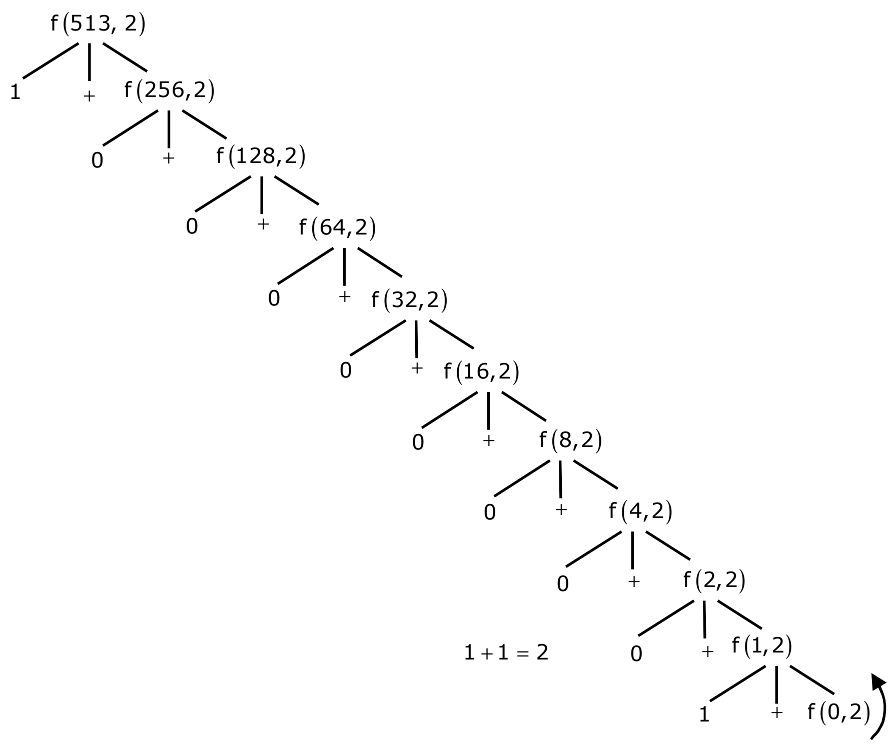
```
unsigned int foo(unsigned int n, unsigned int r) {
    if (n > 0) return (n%r) + foo (n/r, r));
    else return 0;
}
```

48. What is the return value of the function foo when it is called as foo (513, 2)?

(A) 9 (B) 8 (C) 5 (D) 2

Answer: - (D)

Exp: -

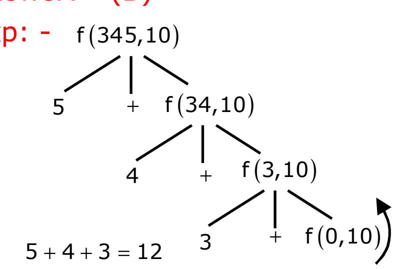


49 What is the return value of the function foo when it is called as foo (345, 10) ?

(A) 345 (B) 12 (C) 5 (D) 3

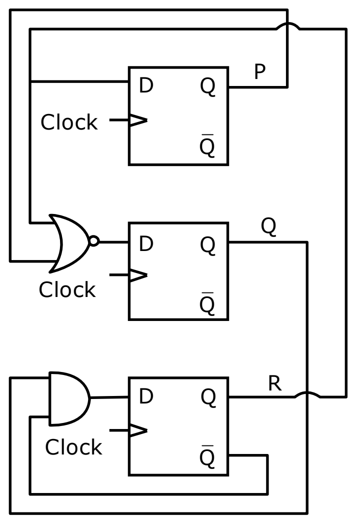
Answer: - (B)

Exp: -



Common Data Questions: 50 & 51

Consider the following circuit involving three D-type flip-flops used in a certain type of counter configuration.



50. If all the flip-flops were reset to 0 at power on, what is the total number of distinct outputs (states) represented by PQR generated by the counter?

(A) 3 (B) 4 (C) 5 (D) 6

Answer: - (B)

Exp: -

CLOCK	Inputs			Outputs		
	$D_1 = R$	$D_2 = \overline{(P+R)}$	$D_3 = Q\,\bar{R}$	P	Q	R
1	0	1	0	0	1	0
2	0	1	1	0	1	1
3	1	0	0	1	0	0
4	0	0	0	0	0	0

So Total number of distinct outputs is 4

51. If at some instance prior to the occurrence of the clock edge, P. Q and R have a value 0, 1 and 0 respectively, what shall be the value of PQR after the clock edge?

(A) 000 (B) 001 (C) 010 (D) 011

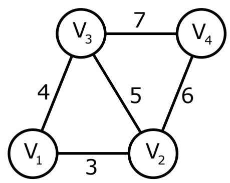
Answer: - (D)

Exp: -From the Table Shown in the explanation of question 50, if first state is 010 next State is 011

Linked Answer Questions: Q.52 to Q.55 Carry Two Marks Each

Statement for Linked Answer Questions: 52 & 53

An undirected graph G(V,E) contains $n\ (n > 2)$ nodes named $v_1, v_2, \dots. v_n$. Two nodes v_i, v_j are connected if and only if $0 < |i - j| \le 2$. Each edge (v_i, v_j) is assigned a weight i + j. A sample graph with n = 4 is shown below



52. What will be the cost of the minimum spanning tree (MST) of such a graph with n nodes?

(A) $\frac{1}{12}(11n^2 - 5n)$ (B) $n^2 - n + 1$

(C) $6n - 11$ (D) $2n + 1$

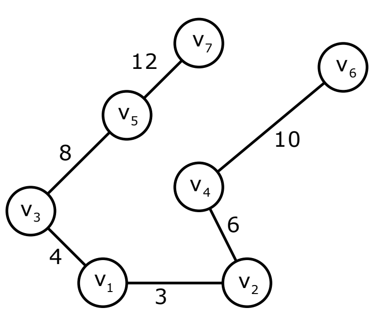
Answer: - (B)

53. The length of the path from v_5 to v_6 in the MST of previous question with n = 10 is

(A) 11 (B) 25 (C) 31 (D) 41

Answer: - (C)

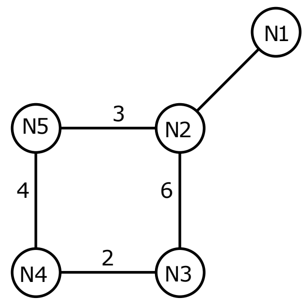
Exp: -



$12 + 8 + 4 + 3 + 6 + 10 = 31$

Statement for Linked Answer Questions: 54 & 55

Consider a network with five nodes, N1 to N5, as shown below



The net work uses a Distance Vector Routing protocol. Once the routes have stabilized, the distance vectors at different nodes are as following

N1 : $(0,1,7,8,4)$

N2 : $(1,0,6,7,3)$

N3 : $(7,6,0,2,6)$

N4 : $(8,7,2,0,4)$

N5 : $(4,3,6,4,0)$

Each distance vector is the distance of the best known path at that instance to nodes, N1 to N5, where the distance to itself is 0. Also, all links are symmetric and the cost is identical in both directions. In each round, all nodes exchange their distance vectors with their respective neighbors. Then all nodes update their distance vectors. In between two rounds, any change in cost of a link will cause the two incident nodes to change only that entry in their distance vectors

54. The cost of link N2-N3 reduces to 2 in (both directions). After the next round of updates, what will be the new distance vector at node, N3?

(A) (3. 2, 0, 2, 5) (B) (3, 2, 0, 2, 6)

(C) (7, 2, 0, 2, 5) (D) (7, 2, 0, 2, 6)

Answer: - (A)

Exp: -

$$\begin{array}{c|c|l} & N_3 & \\ \hline N_1 & 3 & \rightarrow 1+2 \\ \hline N_2 & 2 & \\ \hline N_3 & 0 & \\ \hline N_4 & 2 & \\ \hline N_5 & 5 & \rightarrow 2+3 \\ \hline \end{array}$$

55. After the update in the previous question, the link N1-N2 goes down. N2 will reflect this change immediately in its distance vector as cost, ∞. After the NEXT ROUND of update, what will be the cost to N1 in the distance vector of N3?

(A) 3 (B) 9 (C) 10 (D) ∞

Answer: - (C)

Exp: - N_3 has neighbors N_2 and N_4

N_2 has made entry ∞

N_4 has the distance of 8 to N_1

N_3 has the distance of 2 to N_4

So 2 + 8 = 10

Q. No. 56 – 60 Carry One Mark Each

56. If Log (P) = (1/2)Log (Q) = (1/3) Log (R), then which of the following options is TRUE?

(A) $P^2 = Q^3R^2$ (B) $Q^2 = PR$ (C) $Q^2 = R^3P$ (D) $R = P^2Q^2$

Answer: - (B)

Exp:- $\log P = \frac{1}{2}\log Q = \frac{1}{3}\log(R) = k$

$\therefore P = b^k, Q = b^{2k}, R = b^{3k}$

Now, $Q^2 = b^{4k} = b^{3k}\, b^k = PR$

57. Choose the most appropriate word(s) from the options given below to complete the following sentence.

I contemplated_________Singapore for my vacation but decided against it.

(A) To visit (B) having to visit (C) visiting (D)for a visit

Answer: - (C)

Exp: - Contemplate is a transitive verb and hence is followed by a gerund Hence the correct usage of contemplate is verb+ ing form.

58. Choose the most appropriate word from the options given below to complete the following sentence.

If you are trying to make a strong impression on your audience, you cannot do so by being understated, tentative or______________.

(A) Hyperbolic (B) Restrained

(C) Argumentative (D) Indifferent

Answer: - (B)

Exp: - The tone of the sentence clearly indicates a word that is similar to understated is needed for the blank. Alternatively, the word should be antonym of strong (fail to make strong impression). Therefore, the best choice is restrained which means controlled/reserved/timid.

59. Choose the word from the options given below that is most nearly opposite in meaning to the given word: **Amalgamate**

(A) Merge (B) Split (C) Collect (D) Separate

Answer: - (B)

Exp: - Amalgamate means combine or unite to form one organization or structure. So the best option here is split. Separate on the other hand, although a close synonym, it is too general to be the best antonym in the given question while Merge is the synonym; Collect is not related.

60. Which of the following options is the closest in the meaning to the word below:

Inexplicable

(A) Incomprehensible (B) Indelible

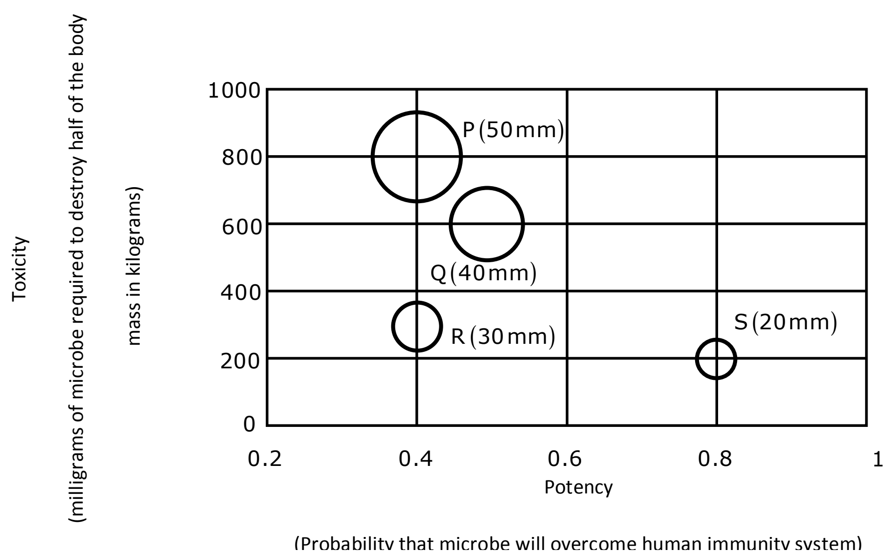
(C) Inextricable (D) Infallible

Answer: - (A)

Exp: - Inexplicable means not explicable; that cannot be explained, understood, or accounted for. So the best synonym here is incomprehensible.

Q. No. 61 – 65 Carry Two Marks Each

61. P, Q, R and S are four types of dangerous microbes recently found in a human habitat. The area of each circle with its diameter printed in brackets represents the growth of a single microbe surviving human immunity system within 24 hours of entering the body. The danger to human beings varies proportionately with the toxicity, potency and growth attributed to a microbe shown in the figure below



A pharmaceutical company is contemplating the development of a vaccine against the most dangerous microbe. Which microbe should the company target in its first attempt?

(A) P (B) Q (C) R (D) S

Answer: - (D)

Exp: - By observation of the table, we can say S

	P	Q	R	S
Requirement	800	600	300	200
Potency	0.4	0.5	0.4	0.8

62. The variable cost (V) of manufacturing a product varies according to the equation V= 4q, where q is the quantity produced. The fixed cost (F) of production of same product reduces with q according to the equation F = 100/q. How many units should be produced to minimize the total cost (V+F)?

(A) 5 (B) 4 (C) 7 (D) 6

Answer: (A)

Exp: - Checking with all options in formula: (4q+100/q) i.e. (V+F). Option A gives the minimum cost.

63. A transporter receives the same number of orders each day. Currently, he has some pending orders (backlog) to be shipped. If he uses 7 trucks, then at the end of the 4th day he can clear all the orders. Alternatively, if he uses only 3 trucks, then all the orders are cleared at the end of the 10th day. What is the minimum number of trucks required so that there will be no pending order at the end of the 5th day?

(A) 4 (B) 5 (C) 6 (D) 7

Answer: - (C)

Exp: - Let each truck carry 100 units.

2800 = 4n + e   n = normal

3000 = 10n + e   e = excess/pending

$$\therefore n = \frac{100}{3}, e = \frac{8000}{3}$$

$$5\text{days} \Rightarrow 500x = \frac{5.100}{3} + \frac{8000}{3}$$

$$\Rightarrow 500x = \frac{8500}{3} 17 \Rightarrow x > 5$$

Minimum possible = 6

64. A container originally contains 10 litres of pure spirit. From this container 1 litre of spirit is replaced with 1 litre of water. Subsequently, 1 litre of the mixture is again replaced with 1 litre of water and this process is repeated one more time. How much spirit is now left in the container?

(A) 7.58 litres (B) 7.84 litres (C) 7 litres (D) 7.29 litres

Answer: - (D)

Exp:- $10\left(\frac{10-1}{10}\right)^{3} = 10\left(\frac{9}{10}\right)^{3} = \frac{729}{1000}$

$\therefore \frac{729}{1000} \times 1 = 7.29$ litres

65. **Few school curricula include a unit on how to deal with bereavement and grief, and yet all students at some point in their lives suffer from losses through death and parting.**

Based on the above passage which topic would not be included in a unit on bereavement?

(A) how to write a letter of condolence

(B) what emotional stages are passed through in the healing process

(C) what the leading causes of death are

(D) how to give support to a grieving friend

Answer: - (C)

Exp: - The given passage clearly deals with how to deal with bereavement and grief and so after the tragedy occurs and not about precautions. Therefore, irrespective of the causes of death, a school student rarely gets into details of causes—which is beyond the scope of the context. Rest all are important in dealing with grief.

Q. No. 1 – 25 Carry One Mark Each

1. Let G=(V, E) be a graph. Define $\xi(G)=\sum_d i_d \times d$, where i_d is the number of vertices of degree d in G. If S and T are two different trees with $\xi(S)=\xi(T)$, then

(A) $|S| = 2|T|$ (B) $|S| = |T| - 1$ (C) $|S| = |T|$ (D) $|S| = |T| + 1$

2. Newton-Raphson method is used to compute a root of the equation $x^2 - 13 = 0$ with 3.5 as the initial value. The approximation after one iteration is

(A) 3.575 (B) 3.676 (C) 3.667 (D) 3.607

3. What is the possible number of reflexive relations on a set of 5 elements?

(A) 2^{10} (B) 2^{15} (C) 2^{20} (D) 2^{25}

4. Consider the set S = {1, ω, ω^2}, where ω and ω^2 are cube roots of unity. If * denotes the multiplication operation, the structure (S, *) forms

(A) A group (B) A ring
(C) An integral domain (D) A field

5. What is the value of $\lim_{n\to\infty}\left(1-\frac{1}{n}\right)^{2n}$?

(A) 0 (B) e^{-2} (C) $e^{-1/2}$ (D) 1

6. The minterm expansion of $f(P, Q, R) = PQ + Q\overline{R} + P\overline{R}$ is

(A) $m_2 + m_4 + m_6 + m_7$ (B) $m_0 + m_1 + m_3 + m_5$
(C) $m_0 + m_1 + m_6 + m_7$ (D) $m_2 + m_3 + m_4 + m_5$

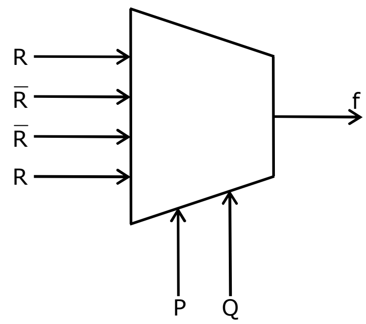
7. A main memory unit with a capacity of 4 megabytes is built using 1M×1-bit DRAM chips. Each DRAM chip has 1K rows of cells with 1K cells in each row. The time taken for a single refresh operation is 100 nanoseconds. The time required to perform one refresh operation on all the cells in the memory unit is

(A) 100 nanoseconds (B) $100*2^{10}$ nanoseconds
(C) $100*2^{20}$ nanoseconds (D) $3200*2^{20}$ nanoseconds

8. P is a 16-bit signed integer. The 2's complement representation of P is $(F87B)_{16}$. The 2's complement representation of 8*P is

(A) $(C3D8)_{16}$ (B) $(187B)_{16}$ (C) $(F878)_{16}$ (D) $(987B)_{16}$

9. The Boolean expression for the output f of the multiplexer shown below is



(A) $\overline{P \oplus Q \oplus R}$

(B) $P \oplus Q \oplus R$

(C) $P + Q + R$

(D) $\overline{P + Q + R}$

10. In a binary tree with n nodes, every node has an odd number of descendants. Every node is considered to be its own descendant. What is the number of nodes in the tree that have exactly one child?

(A) 0 (B) 1 (C) $(n-1)/2$ (D) n-1

11. What does the following program print?

```
#include < stdio.h >
void f (int * p, int * g){
        p = q;
        * p = 2;
}
int i = 0, j = 1;
int main ( ){
        f(&i, & j);
        printf ("%d %d \ n",  i, j);
        return 0;
}
```

(A) 2 2 (B) 2 1 (C) 0 1 (D) 0 2

12. Two alternative packages A and B are available for processing a database having 10^k records. Package A requires $0.0001n^2$ time units and package B requires $10n\log_{10}n$ time units to process n records. What is the smallest value of k for which package B will be preferred over A?

(A) 12 (B) 10 (C) 6 (D) 5

13. Which data structure in a compiler is used for managing information about variables and their attributes?

(A) Abstract syntax tree (B) Symbol table

(C) Semantic stack (D) Parse table

14. Which languages necessarily need heap allocation in the runtime environment?

(A) Those that support recursion (B) Those that use dynamic scoping

(C) Those that allow dynamic data structures (D) Those that use global variables

15. One of the header fields in an IP datagram is the Time to Live (TTL) field. Which of the following statements best explains the need for this field?

(A) It can be used to prioritize packets

(B) It can be used to reduce delays

(C) It can be used to optimize throughput

(D) It can be used to prevent packet looping

16. Which one of the following is not a client server application?

(A) Internet chat (B) Web browsing (C) E-mail (D) Ping

17. Let L1 be a recursive language. Let L2 and L3 be languages that are recursively enumerable but not recursive. Which of the following statements is not necessarily true?

(A) L2 – L1 is recursively enumerable

(B) L1 – L3 is recursively enumerable

(C) $L2 \cap L1$ is recursively enumerable

(D) $L2 \cup L1$ is recursively enumerable

18. Consider a B^+-tree in which the maximum number of keys in a node is 5. What is the minimum number of keys in any non-root node?

(A) 1 (B) 2 (C) 3 (D) 4

19. A relational schema for a train reservation database is given below

Passenger (pid, pname, age)

Reservation (pid, cass, tid)

Table : Passenger

pid	'pname	Age
0	'Sachin'	65
1	'Rahul'	66
2	'Sourav'	67
3	'Anil'	69

Table : Reservation

pid	class	tid
0	'AC'	8200
1	'AC'	8201
2	'SC'	8201
5	'AC'	8203
1	'SC'	8204
3	'AC'	8202

What pids are returned by the following SQL query for the above instance of the tables?

```
SELECT   pid
FROM     Reservation
WHERE    class = 'AC'  AND
         EXISTS  (SELECT  *
                  FROM Passenger
                  WHERE  age > 65  AND
                  Passenger.pid = Reservation.pid)
```

(A) 1, 0 (B) 1, 2 (C) 1, 3 (D) 1, 5

20. Which of the following concurrency control protocols ensure both conflict serializability and freedom from deadlock?

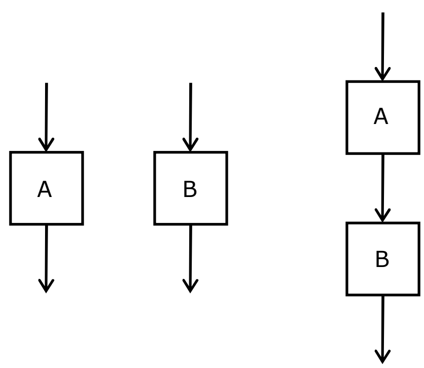
I. 2-phase locking

II. Time-stamp ordering

(A) I only (B) II only

(C) Both I and II (D) Neither I nor II

21. The cyclomatic complexity of each of the modules A and B shown below is 10. What is the cyclomatic complexity of the sequential integration shown on the right hand side?



(A) 19 (B) 21 (C) 20 (D) 10

22. What is the appropriate pairing of items in the two columns listing various activities encountered in a software life cycle?

P. Requirements Capture	1. Module Development and Integration
Q. Design	2. Domain Analysis
R. Implementation	3. Structural and Behavioral Modeling
S. Maintenance	4. Performance Tuning

(A) P-3, Q-2,R-4,S-1 (B) P-2, Q-3,R-1,S-4

(C) P-3, Q-2,R-1,S-4 (D) P-2, Q-3,R-4,S-1

23. Consider the methods used by processes P1 and P2 for accessing their critical sections whenever needed, as given below. The initial values of shared boolean variables S1 and S2 are randomly assigned.

Method used by PI	**Method used by P2**
while (S 1 = = S 2) ; Critica1 Section S1 = S2;	while (S 1 != S 2) ; Critica1 Section S2 = not (S1);

Which one of the following statements describes the properties achieved?

(A) Mutual exclusion but not progress

(B) Progress but not mutual exclusion

(C) Neither mutual exclusion nor progress

(D) Both mutual exclusion and progress

24. A system uses FIFO policy for page replacement. It has 4 page frames with no pages loaded to begin with. The system first accesses 100 distinct pages in some order and then accesses the same 100 pages but now in the reverse order. How many page faults will occur?

(A) 196 (B) 192 (C) 197 (D) 195

25. Which of the following statements are true?

I. Shortest remaining time first scheduling may cause starvation

II. Preemptive scheduling may cause starvation

III. Round robin is better than FCFS in terms of response time

(A) I only (B) I and III only (C) II and III only (D) I, II and III

Q. No. 26 – 55 Carry Two Marks Each

26. Consider a company that assembles computers. The probability of a faulty assembly of any computer is *p.* The company therefore subjects each computer to a testing process. This testing process gives the correct result for any computer with a probability of *q.* What is the probability of a computer being declared faulty?

(A) $pq+(1-p)(1-q)$ (B) $(1-q)p$ (C) $(1-p)q$ (D) pq

27. What is the probability that divisor of 10^{99} is a multiple of 10^{96}?

(A) 1/625 (B) 4/625 (C) 12/625 (D) 16/625

28. The degree sequence of a simple graph is the sequence of the degrees of the nodes in the graph in decreasing order. Which of the following sequences can not be the degree sequence of any graph?

I. 7, 6, 5, 4, 4, 3, 2, 1 II. 6, 6, 6, 6, 3, 3, 2, 2

III. 7, 6, 6, 4, 4, 3, 2, 2 IV. 8, 7, 7, 6, 4, 2, 1, 1

(A) I and II (B) III and IV (C) IV only (D) II and IV

29. Consider the following matrix

$$A = \begin{bmatrix} 2 & 3 \\ x & y \end{bmatrix}$$

If the eigenvalues of A are 4 and 8, then

(A) $x = 4, y = 10$ (B) $x = 5, y = 8$ (C) $x = -3, y = 9$ (D) $x = -4, y = 10$

30. Suppose the predicate F(x, y, t) is used to represent the statement that person x can fool person y at time t. which one of the statements below expresses best the meaning of the formula $\forall x \exists y \exists t (\neg F(x, y, t))$?

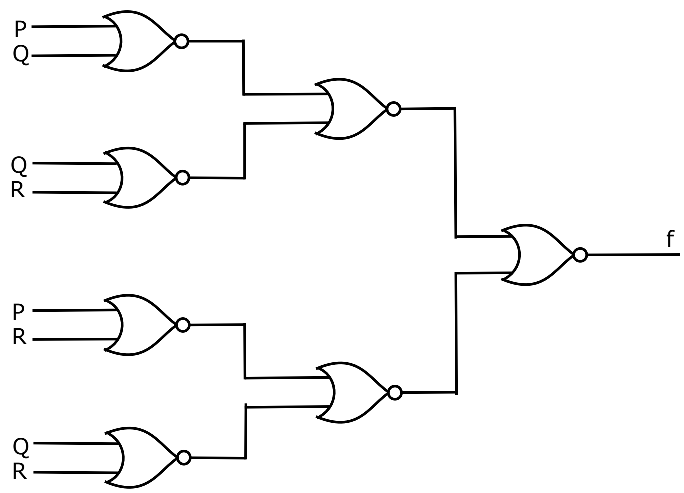
(A) Everyone can fool some person at some time

(B) No one can fool everyone all the time

(C) Everyone cannot fool some person all the time

(D) No one can fool some person at some time

31. What is the Boolean expression for the output f of the combinational logic circuit of NOR gates given below?



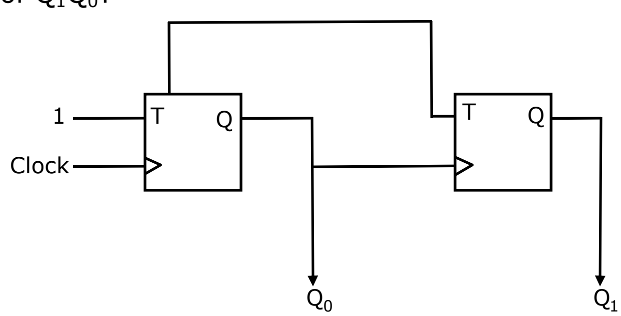
(A) $\overline{Q+R}$

(B) $\overline{P+Q}$

(C) $\overline{P+R}$

(D) $\overline{P+Q+R}$

32. In the sequential circuit shown below, if the initial value of the output Q_1Q_0 is 00, what are the next four values of Q_1Q_0?



(A) 11,10,01,00

(B) 10,11,01,00

(C) 10,00,01,11

(D) 11,10,00,01

33. A 5-stage pipelined processor has Instruction Fetch (IF), Instruction Decode (ID), Operand Fetch (OF), Perform Operation (PO) and Write Operand (WO) stages. The IF, ID, OF and WO stages take 1 clock cycle each for any instruction. The PO stage takes 1 clock cycle for ADD and SUB instructions, 3 clock cycles for MUL instruction, and 6 clock cycles for DIV instruction respectively. Operand forwarding is used in the pipeline. What is the number of clock cycles needed to execute the following sequence of instructions?

Instruction	Meaning of instruction
$I_0 : \text{MUL } R_2, R_0, R_1$	$R_2 \leftarrow R_0 * R_1$
$I_1 : \text{DIV } R_5, R_3, R_4$	$R_5 \leftarrow R_3 / R_4$
$I_2 : \text{ADD } R_2, R_5, R_2$	$R_2 \leftarrow R_5 + R_2$
$I_3 : \text{SUB } R_5, R_2, R_6$	$R_5 \leftarrow R_2 - R_6$

(A) 13 (B) 15 (C) 17 (D) 19

34. The weight of a sequence a_0, $a_1, \ldots, a_{n-1}$ of real numbers is defined as $a_0 + a_1/2 + \ldots + a_{n-1}/2^{n-1}$. A subsequence of a sequence is obtained by deleting some elements from the sequence, keeping the order of the remaining elements the same. Let X denote the maximum possible weight of a subsequence of $a_0, a_1, \ldots, a_{n-1}$. Then X is equal to

(A) $\max(Y, a_0 + Y)$ (B) $\max(Y, a_0 + Y/2)$ (C) $\max(Y, a_0 + 2Y)$ (D) $a_0 + Y/2$

35. What is the value printed by the following C program?

```
#include <stdio.h>
int f(int * a, int n)
{
    if (n <= 0)return 0;
    else if(*a % 2 = = 0) return * a + f(a + 1, n - 1);
    else return * a - f(a + 1, n - 1);
}
int main ( )
{
    int a[ ] = {12, 7, 13, 4, 11, 6};
    printf ("%d",  f(a, 6));
    return 0;
}
```

(A) -9 (B) 5 (C) 15 (D) 19

36. The following C function takes a simply-linked list as input argument. It modifies the list by moving the last element to the front of the list and returns the modified list. Some part of the code is left blank.

```
typedef struct node {
          int value;
          struct node *next;
}     Node;
Node *move_to_front(Node *head) {
        Node *p, *q;
        if ((head = = NULL:  || (head->next = = NULL)) return head;
        q = NULL; p = head;
        while (p-> next !=NULL)  {
                q=P;
                p=p->next;
}
________________________________
return head;
}
```

Choose the correct alternative to replace the blank line.

(A) q = NULL; p->next = head; head = p;

(B) q->next = NULL; head = p; p->next = head;

(C) head = p; p->next = q; q->next = NULL;

(D) q->next = NULL; p->next = head; head = p;

37. The program below uses six temporary variables a, b, c, d, e, f.

$a = 1$

$b = 10$

$c = 20$

$d = a + b$

$e = c + d$

$f = c + e$

$b = c + e$

$e = b + f$

$d = 5 + e$

return $d + f$

Assuming that all operations take their operands from registers, what is the minimum number of registers needed to execute this program without spilling?

(A) 2 (B) 3 (C) 4 (D) 6

38. The grammar $S \rightarrow aSa|bS|c$ is

(A) LL(1) but not LR(1)

(B) LR(1) but not LR(1)

(C) Both LL(1) and LR(1)

(D) Neither LL(1) nor LR(1)

39. Let $L = \{w \in (0+1)^* \mid w \text{ has even number of 1s}\}$, i.e. L is the set of all bit strings with even number of 1s. Which one of the regular expressions below represents L?

(A) $(0^*10^*1)^*$

(B) $0^*(10^*10^*)^*$

(C) $0^*(10^*1^*)^*0^*$

(D) $0^*1(10^*1)^*10^*$

40. Consider the languages $L1 = \{0^i1^j \mid i \neq j\}$. $L2 = \{0^i1^j \mid i = j\}$. $L3 = \{0^i1^j \mid i = 2j+1\}$. $L4 = \{0^i1^j \mid i \neq 2j\}$. Which one of the following statements is true?

(A) Only L2 is context free

(B) Only L2 and L3 are context free

(C) Only L1 and L2 are context free

(D) All are context free

41. Let w be any string of length n in {0, 1}*. Let L be the set of all substrings of w. What is the minimum number of states in a non-deterministic finite automaton that accepts L?

(A) n-1

(B) n

(C) n+1

(D) 2^{n-1}

42. Consider the following schedule for transactions T1, T2 and T3:

<u>T1</u>	<u>T2</u>	<u>T3</u>
Read(X)		
	Read(Y)	
		Read(Y)
	Write(Y)	
Write(X)		
		Write(X)
	Read(X)	
	Write(X)	

Which one of the schedules below is the correct serialization of the above?

(A) $T1 \rightarrow T3 \rightarrow T2$

(B) $T2 \rightarrow T1 \rightarrow T3$

(C) $T2 \rightarrow T3 \rightarrow T1$

(D) $T3 \rightarrow T1 \rightarrow T2$

43. The following functional dependencies hold for relations R(A, B, C) and S(B, D, E)

$B \rightarrow A$,
$A \rightarrow C$

The relation R contains 200tuples and the relation S contains 100tuples. What is the maximum number of tuples possible in the natural join $R \bowtie S$?

(A) 100

(B) 200

(C) 300

(D) 2000

44. The following program is to be tested for statement coverage:

```
begin
    if (a = = b)  {S1;  exit;}
    else if (c = = d)   {S2;}
         else {S3; exit;}
    S4;
end
```

The test cases T1, T2, T3 and T4 given below are expressed in terms of the properties satisfied by the values of variables a, b, c and d. The exact values are not given.

T1 : a, b, c and d are all equal

T2 : a, b, c and d are all distinct

T3 : a=b and c !=d

T4 : a !=b and c=d

Which of the test suites given below ensures coverage of statements S1, S2, S3 and S4?

(A) T1, T2, T3 (B) T2, T4 (C) T3, T4 (D) T1, T2, T4

45. The following program consists of 3 concurrent processes and 3 binary semaphores. The semaphores are initialized as S0=1, S1=0, S2=0.

Process P0	**Process P1**	**Process P2**

while (true) {
wait (S0);
print '0'
release (S1);
release (S2);
}
	wait (S1);
	Release (S0);
		wait (S2);
		release (S0);

How many times will process P0 print '0'?

(A) At least twice (B) Exactly twice (C) Exactly thrice (D) Exactly once

46. A system has n resources $R_0,\ldots,R_{n-1}$, and k processes $P_{0,\ldots}..P_{k-1}$. The implementation of the resource request logic of each process P_i. is as follows:

```
if (i% 2==0) {
   if (i<n) request R_i;
   if (i+2<n)request R_{i+2};
}
else {
   if (i<n) request R_{n-i};
   if (i+2<n)request R_{n-i-2};
}
```

In which one of the following situations is a deadlock possible?

(A) $n = 40, k = 26$ (B) $n = 21, k = 12$ (C) $n = 20, k = 10$ (D) $n = 41, k = 19$

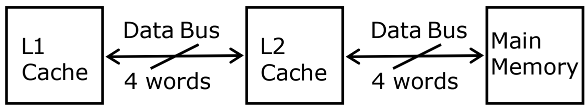
47. Suppose computers A and B have IP addresses 10.105.1.113 and 10.105.1.91 respectively and they both use the same net mask N. Which of the values of N given below should not be used if A and B should belong to the same network?

(A) 255.255.255.0 (B) 255.255.255.128

(C) 255.255.255.192 (D) 255.255.255.224

Common Data Questions: 48 & 49

A computer system has an L1 cache, an L2 cache, and a main memory unit connected as shown below. The block size in L1 cache is 4 words. The block size in L2 cache is 16 words. The memory access times are 2 nanoseconds. 20 nanoseconds and 200 nanoseconds for L1 cache, L2 cache and main memory unit respectively.



48. When there is a miss in L1 cache and a hit in L2 cache, a block is transferred from L2 cache to L1 cache. What is the time taken for this transfer?

(A) 2 nanoseconds (B) 20 nanoseconds

(C) 22 nanoseconds (D) 88 nanoseconds

49. When there is a miss in both L1 cache and L2 cache, first a block is transferred from main memory to L2 cache, and then a block is transferred from L2 cache to L1 cache. What is the total time taken for these transfers?

(A) 222 nanoseconds (B) 888 nanoseconds

(C) 902 nanoseconds (D) 968 nanoseconds

Common Data Questions: 50 & 51

Consider a complete undirected graph with vertex set {0, 1, 2, 3, 4}. Entry W_{ij} in the matrix W below is the weight of the edge {i, j}.

$$W = \begin{pmatrix} 0 & 1 & 8 & 1 & 4 \\ 1 & 0 & 12 & 4 & 9 \\ 8 & 12 & 0 & 7 & 3 \\ 1 & 4 & 7 & 0 & 2 \\ 4 & 9 & 3 & 2 & 0 \end{pmatrix}$$

50. What is the minimum possible weight of a spanning tree T in this graph such that vertex 0 is a leaf node in the tree T?

(A) 7 (B) 8 (C) 9 (D) 10

51. What is the minimum possible weight of a path P from vertex 1 to vertex 2 in this graph such that P contains at most 3 edges?

(A) 7 (B) 8 (C) 9 (D) 10

Linked Answer Questions: Q.52 to Q.55 Carry Two Marks Each

Statement for Linked Answer Questions: 52 & 53

A hash table of length 10 uses open addressing with hash function h(k)=k mod 10, and linear probing. After inserting 6 values into an empty hash table, the table is as shown below

0	
1	
2	42
3	23
4	34
5	52
6	46
7	33
8	
9	

52. Which one of the following choices gives a possible order in which the key values could have been inserted in the table?

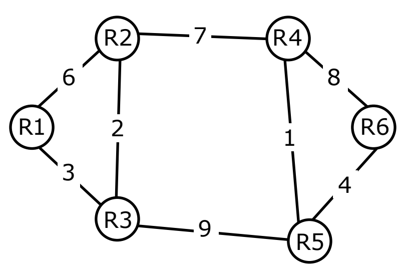
(A) 46, 42, 34, 52, 23, 33
(B) 34, 42, 23, 52, 33, 46
(C) 46, 34, 42, 23, 52, 33
(D) 42, 46, 33, 23, 34, 52

53. How many different insertion sequences of the key values using the same hash function and linear probing will result in the hash table shown above?

(A) 10 (B) 20 (C) 30 (D) 40

Statement for Linked Answer Questions: 54 & 55

Consider a network with 6 routers R1 to R6 connected with links having weights as shown in the following diagram



54. All the routers use the distance vector based routing algorithm to update their routing tables. Each router starts with its routing table initialized to contain an entry for each neighbour with the weight of the respective connecting link. After all the routing tables stabilize, how many links in the network will never be used for carrying any data?

(A) 4 (B) 3 (C) 2 (D) 1

55. Suppose the weights of all unused links in the previous question are changed to 2 and the distance vector algorithm is used again until all routing tables stabilize. How many links will now remain unused?

(A) 0 (B) 1 (C) 2 (D) 3

Q. No. 56 – 60 Carry One Mark Each

56. Choose the most appropriate word from the options given below to the complete the following sentence:

His rather casual remarks on politics ___________ his lack of seriousness about the subject.

(A) masked (B) belied (C) betrayed (D) suppressed

57. Which of the following options is closest in meaning to the word Circuitous.

(A) cyclic (B) indirect (C) confusing (D) crooked

58. Choose the most appropriate word from the options given below to complete the following sentence:

If we manage to ____________ our natural resources, we would leave a better planet for our children.

(A) uphold (B) restrain (C) cherish (D) conserve

59. 25 persons are in a room. 15 of them play hockey, 17 of them play football and 10 of them play both hockey and football. Then the number of persons playing neither hockey nor football is:

(A) 2 (B) 17 (C) 13 (D) 3

60. The question below consists of a pair of related words followed by four pairs of words. Select the pair that best expresses the relation in the original pair.

Unemployed: Worker

(A) fallow: land (B) unaware: sleeper (C) wit: jester (D) renovated:house

Q. No. 61 – 65 Carry Two Marks Each

61. If 137+276=435 how much is 731+672?

(A) 534 (B) 1403 (C) 1623 (D) 1513

62. Hari (H), Gita (G), Irfan (I) and Saira (S) are siblings (i.e. brothers and sisters). All were born on 1^{st} january. The age difference between any two successive siblings (that is born one after another) is less than 3 years. Given the following facts:

i. Hari's age + Gita's age > Irfan's age + Saira's age

ii. The age difference between Gita and Saira is 1 year. However Gita is not the oldest and Saira is not the youngest.

iii. There are no twins.

In what order were they born (oldest first)?

(A) HSIG (B) SGHI (C) IGSH (D) IHSG

64. 5 skilled workers can build a wall in 20days: 8 semi-skilled workers can build a wall in 25 days; 10 unskilled workers can build a wall in 30days. If a team has 2 skilled, 6 semi-skilled and 5 unskilled workers, how long will it take to build the wall?

(A) 20 (B) 18 (C) 16 (D) 15

63. Modern warfare has changed from large scale clashes of armies to suppression of civilian populations. Chemical agents that do their work silently appear to be suited to such warfare; and regretfully, there exist people in military establishments who think that chemical agents are useful tools for their cause.

Which of the following statements best sums up the meaning of the above passage:

(A) Modern warfare has resulted in civil strife.

(B) Chemical agents are useful in modern warfare.

(C) Use of chemical agents in warfare would be undesirable

(D) People in military establishments like to use chemical agents in war.

65. Given digits 2,2,3,3,4,4,4,4 how many distinct 4 digit numbers greater than 3000 can be formed?

(A) 50 (B) 51 (C) 52 (D) 54

Q. No. 1 – 20 Carry One Mark Each

1. Which one of the following in NOT necessarily a property of a Group?
   (A) Commutativity (B) Associativity
   (C) Existence of inverse for every element (D) Existence of identity

2. What is the chromatic number of an n-vertex simple connected graph which does not contain any odd length cycle? Assume $n \geq 2$.
   (A) 2 (B) 3 (C) n-1 (D) n

3. Which one of the following is TRUE for any simple connected undirected graph with more than 2 vertices?
   (A) No two vertices have the same degree.
   (B) At least two vertices have the same degree.
   (C) At least three vertices have the same degree.
   (D) All vertices have the same degree.

4. Consider the binary relation R = {(x,y), (x,z), (z,x), (z,y)} on the set {x,y,z}. Which one of the following is TRUE?
   (A) R is symmetric but NOT antisymmetric
   (B) R is NOT symmetric but antisymmetric
   (C) R is both symmetric and antisymmetric
   (D) R is neither symmetric nor antisymmetric

5. $(1217)_8$ is equivalent to
   (A) $(1217)_{16}$ (B) $(028F)_{16}$ (C) $(2297)_{10}$ (D) $(0B17)_{16}$

6. What is the minimum number of gates required to implement the Boolean function (AB+C) if we have to use only 2-input NOR gates?
   (A) 2 (B) 3 (C) 4 (D) 5

7. How many 32K x 1 RAM chips are needed to provide a memory capacity of 256K-bytes?
   (A) 8 (B) 32 (C) 64 (D) 128

8. A CPU generally handles an interrupt by executing an interrupt service routine
   (A) As soon as an interrupt is raised
   (B) By checking the interrupt register at the end of fetch cycle.
   (C) By checking the interrupt register after finishing the execution of the current instruction.
   (D) By checking the interrupt register at fixed time intervals.

9. In which one of the following page replacement policies, Belady's anomaly may occur?

(A) FIFO (B) Optimal (C) LRU (D) MRU

10. The essential content(s) in each entry of a page table is / are

(A) Virtual page number

(B) Page frame number

(C) Both virtual page number and page frame number

(D) Access right information

11. What is the number of swaps required to sort n elements using selection sort, in the worst case?

(A) $\theta(n)$ (B) $\theta(n \log n)$ (C) $\theta(n^2)$ (D) $\theta(n^2 \log n)$

12. $S \rightarrow aSa \mid bSb \mid a \mid b$;The language generated by the above grammar over the alphabet {a,b} is the set of

(A) All palindromes.

(B) All odd length palindromes.

(C) Strings that begin and end with the same symbol

(D) All even length palindromes.

13. Which of the following statement(s) is / are correct regarding Bellman-Ford shortest path algorithm?

P. Always finds a negative weighted cycle, if one exists.

Q. Finds whether any negative weighted cycle is reachable from the source.

(A) P only (B) Q only

(C) both P and Q (D) Neither P nor Q

14. Let π_A be a problem that belongs to the class NP. Then which one of the following is TRUE?

(A) There is no polynomial time algorithm for π_A .

(B) If π_A can be solved deterministically in polynomial time, then P = NP.

(C) If π_A is NP-hard, then it is NP-complete.

(D) π_A may be undecidable.

15. Which one of the following languages over the alphabet {0,1} is described by the regular expression: (0+1)*0(0+1)*0(0+1)*?

(A) The set of all strings containing the substring 00.

(B) The set of all strings containing at most two 0's.

(C) The set of all strings containing at least two 0's.

(D) The set of all strings that begin and end with either 0 or 1.

16. Which one of the following is FALSE?

(A) There is unique minimal DFA for every regular language

(B) Every NFA can be converted to an equivalent PDA.

(C) Complement of every context-free language is recursive.

(D) Every nondeterministic PDA can be converted to an equivalent deterministic PDA.

17. Match all items in Group 1 with correct options from those given in Group 2.

Group 1		Group 2	
P.	Regular expression	1.	Syntax analysis
Q.	Pushdown automata	2.	Code generation
R.	Dataflow analysis	3.	Lexical analysis
S.	Register allocation	4.	Code optimization

(A) P-4. Q-1, R-2, S-3 (B) P-3, Q-1, R-4, S-2

(C) P-3, Q-4, R-1, S-2 (D) P-2, Q-1, R-4, S-3

18. Consider the program below:

```
# include < stdio.h >
int fun(int n, int * f_p) {
        int t, f;
        if (n <= 1) {
                * f_p = 1;
                return 1;
        }
        t = fun (n- 1, f_p);
        f = t+ * f_p;
        * f_p = t;
        return f;
}
int main() {
        int x = 15;
        printf ("% d\ n", fun(5, & x));
        return 0;
}
```

The value printed is

(A) 6 (B) 8 (C) 14 (D) 15

19. The coupling between different modules of a software is categorized as follows:

I. Content coupling
II. Common coupling
III. Control coupling
IV Stamp coupling
V. Data coupling

Coupling between modules can be ranked in the order of strongest (least desirable) to weakest (most desirable) as follows:

(A) I-II-III-IV-V (B) V-IV-III-II-I (C) I-III-V -II-IV (D) IV-II-V -III-I

20. Consider the HTML table definition given below:

```
< table border=1>
        <tr> <td rowspan=2> ab </td>
            <td colspan=2> cd </td>
        </tr>
        <tr> <td> ef </td>
            <td rowspan=2> gh </td>
        </tr>
        <tr> <td colspan=2> ik </td>
        </tr>
</table>
```

The number of rows in each column and the number of columns in each row are:

(A) $\langle 2,2,3 \rangle$ and $\langle 2,3,2 \rangle$
(B) $\langle 2,2,3 \rangle$ and $\langle 2,2,3 \rangle$
(C) $\langle 2,3,2 \rangle$ and $\langle 2,3,2 \rangle$
(D) $\langle 2,3,2 \rangle$ and $\langle 2,2,3 \rangle$

Q. No. 21 – 56 Carry Two Marks Each

21. An unbalanced dice (with 6 faces, numbered from 1 to 6) is thrown. The probability that the face value is odd is 90% of the probability that the face value is even. The probability of getting any even numbered face is the same.

If the probability that the face is even given that it is greater than 3 is 0.75, which one of the following options is closest to the probability that the face value exceeds 3?

(A) 0.453
(B) 0.468
(C) 0.485
(D) 0.492

22. For the composition table of a cyclic group shown below

*	a	b	c	d
a	a	b	c	d
b	b	a	d	c
c	c	d	b	a
d	d	c	a	b

Which one of the following choices is correct?

(A) a, b are generators
(B) b, c are generators
(C) c, d are generators
(D) d, a are generators

23. Which one of the following is the most appropriate logical formula to represent the statement? “Gold and silver ornaments are precious”.

The following notations are used:

G(x): x is a gold ornament

S(x): x is a silver ornament

P(x): x is precious

(A) $\forall x\left(P(x) \rightarrow \left(G(x) \wedge S(x)\right)\right)$
(B) $\forall x\left(\left(G(x) \wedge S(x)\right) \rightarrow P(x)\right)$
(C) $\exists x\left(\left(G(x) \wedge S(x)\right) \rightarrow P(x)\right)$
(D) $\forall x\left(\left(G(x) \vee S(x)\right) \rightarrow P(x)\right)$

24. The binary operation $\square$ is defined as follows

P	Q	P$\square$Q
T	**T**	**T**
T	**F**	**T**
F	**T**	**F**
F	**F**	**T**

Which one of the following is equivalent to $P \vee Q$?

(A) $\neg Q \square \neg P$ (B) $P \square \neg Q$ (C) $\neg P \square Q$ (D) $\neg P \square \neg Q$

25. $\int_0^{\pi/4} (1 - \tan x)/(1 + \tan x)\, dx$ evaluates to

(A) 0 (B) 1 (C) ln 2 (D) $\frac{1}{2}$ln 2

26. Consider the following well-formed formulae:

I. $\neg \forall x (P(x))$ II. $\neg \exists x (P(x))$ III. $\neg \exists x (\neg P(x))$ IV. $\neg \exists x (\neg P(x))$

Which of the above are equivalent?

(A) I and III (B) I and IV (C) II and III (D) II and IV

27. Given the following state table of an FSM with two states A and B, one input and one output:

Present State A	Present State B	Input	Next State A	Next State B	Output
0	0	0	0	0	1
0	1	0	1	0	0
1	0	0	0	1	0
1	1	0	1	0	0
0	0	1	0	1	0
0	1	1	0	0	1
1	0	1	0	1	1
1	1	1	0	0	1

If the initial state is A = 0, B=0, what is the minimum length of an input string which will take the machine to the state A=0, B=1 with Output=1?

(A) 3 (B) 4 (C) 5 (D) 6

28. Consider a 4 stage pipeline processor. The number of cycles needed by the four instructions I1, I2, I3, I4 in stages S1, S2, S3, S4 is shown below:

	S1	S2	S3	S4
I1	2	1	1	1
I2	1	3	2	2
I3	2	1	1	3
I4	1	2	2	2

What is the number of cycles needed to execute the following loop?

For (i=1 to 2) {I1; I2; I3; I4;}

(A) 16 (B) 23 (C) 28 (D) 30

29. Consider a 4-way set associative cache (initially empty) with total 16 cache blocks. The main memory consists of 256 blocks and the request for memory blocks is in the following order:

0, 255, 1, 4, 3, 8, 133, 159, 216, 129, 63, 8, 48, 32, 73, 92, 155.

Which one of the following memory block will NOT be in cache if LRU replacement policy is used?

(A) 3 (B) 8 (C) 129 (D) 216

30. Consider a system with 4 types of resources R1 (3 units), R2 (2 units), R3 (3 units), R4 (2 units). A non-preemptive resource allocation policy is used. At any given instance, a request is not entertained if it cannot be completely satisfied. Three processes P1, P2, P3 request the sources as follows if executed independently.

Process P1:	Process P2:	Process P3:
t=0: requests 2 units of R2	t=0: requests 2 units of R3	t=0: requests 1 unit of R4
t=1: requests 1 unit of R3	t=2: requests 1 unit of R4	t=2: requests 2 units of R1
t=3: requests 2 units of R1	t=4: requests 1 unit of R1	t=5: releases 2 units of R1
t=5: releases 1 unit of R2 and 1 unit of R1.	t=6: releases 1 unit of R3	t=7: requests 1 unit of R2
t=7: releases 1 unit of R3	t=8: Finishes	t=8: requests 1 unit of R3
t=8: requests 2 units of R4		t=9: Finishes
t=10: Finishes		

Which one of the following statements is TRUE if all three processes run concurrently starting at time t=0?

(A) All processes will finish without any deadlock

(B) Only P1 and P2 will be in deadlock.

(C) Only P1 and P3 will be in a deadlock.

(D) All three processes will be in deadlock.

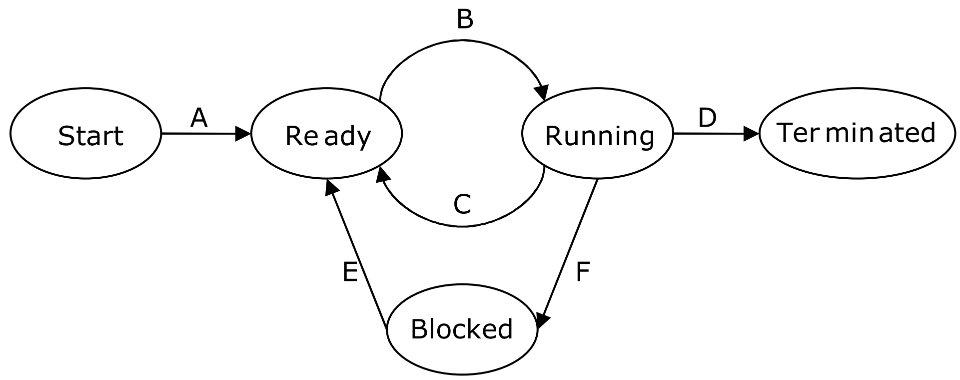
31. Consider a disk system with 100 cylinders. The requests to access the cylinders occur in following sequence:

4, 34, 10, 7, 19, 73, 2, 15, 6, 20

Assuming that the head is currently at cylinder 50, what is the time taken to satisfy all requests if it takes 1ms to move from one cylinder to adjacent one and shortest seek time first policy is used?

(A) 95ms (B) 119ms (C) 233ms (D) 276ms

32. In the following process state transition diagram for a uniprocessor system, assume that there are always some processes in the ready state:



Now consider the following statements:

I. If a process makes a transition D, it would result in another process making transition A immediately.

II. A process P_2 in blocked state can make transition E while another process P_1 is in running state.

III. The OS uses preemptive scheduling.

IV. The OS uses non-preemptive scheduling.

Which of the above statements are TRUE?

(A) I and II (B) I and III (C) II and III (D) II and IV

33. The enter_CS() and leave_CS() functions to implement critical section of a process are realized using test-and-set instruction as follows:

```
void enter_CS(X)
{
        while(test-and-set(X));
}
void leave_CS(X)
{
        X=0;
}
```

In the above solution, X is a memory location associated with the CS and is initialized to 0. Now consider the following statements:

I. The above solution to CS problem is deadlock-free

II. The solution is starvation free.

III. The processes enter CS in FIFO order.

IV More than one process can enter CS at the same time.

Which of the above statements is TRUE?

(A) I only (B) I and II (C) II and III (D) IV only

34. A multilevel page table is preferred in comparison to a single level page table for translating virtual address to physical address because

(A) It reduces the memory access time to read or write a memory location.

(B) It helps to reduce the size of page table needed to implement the virtual address space of a process.

(C) It is required by the translation lookaside buffer.

(D) It helps to reduce the number of page faults in page replacement algorithms.

35. The running time of an algorithm is represented by the following recurrence relation:

$$T(n) = \begin{cases} n & n \leq 3 \\ T\left(\frac{n}{3}\right) + cn & \text{otherwise} \end{cases}$$

Which one of the following represents the time complexity of the algorithm?

(A) $\theta(n)$ (B) $\theta(n \log n)$ (C) $\theta(n^2)$ (D) $\theta(n^2 \log n)$

36. The keys 12, 18, 13, 2, 3, 23, 5 and 15 are inserted into an initially empty hash table of length 10 using open addressing with hash function h(k) = k mod 10 and linear probing. What is the resultant hash table?

(A)

0	
1	
2	2
3	23
4	
5	15
6	
7	
8	18
9	

(B)

0	
1	
2	12
3	13
4	
5	5
6	
7	
8	18
9	

(C)

0	
1	
2	12
3	13
4	2
5	3
6	23
7	5
8	18
9	15

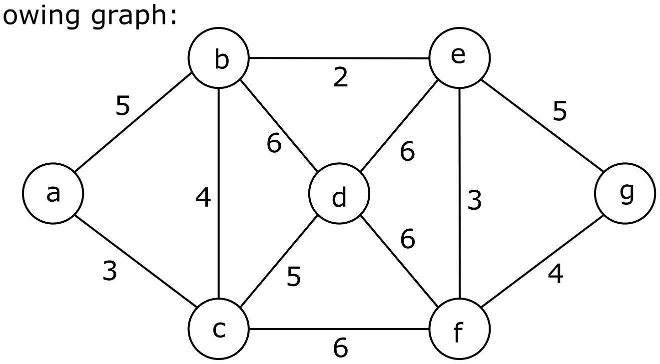
(D)

0	
1	
2	12,2
3	13,3,23
4	
5	5,15
6	
7	
8	18
9	

37. What is the maximum height of any AVL-tree with 7 nodes? Assume that the height of a tree with a single node is 0.

(A) 2 (B) 3 (C) 4 (D) 5

38. Consider the following graph:



Which one of the following is NOT the sequence of edges added to the minimum spanning tree using Kruskal's algorithm?

(A) (b,e) (e,f) (a,c) (b,c) (f,g) (c,d)   (B) (b,e) (e,f) (a,c) (f,g) (b,c) (c,d)

(C) (b,e) (a,c) (e,f) (b,c) (f,g) (c,d)   (D) (b,e) (e,f) (b,c) (a,c) (f,g) (c,d)

39. In quick sort, for sorting n elements, the $(n/4)^{th}$ smallest element is selected as pivot using an O(n) time algorithm. What is the worst case time complexity of the quick sort?

(A) $\theta(n)$ (B) $\theta(n \log n)$ (C) $\theta(n^2)$ (D) $\theta(n^2 \log n)$

40. Let $L = L_1 \cap L_2$, where L_1 and L_2 are languages as defined below:

$L_1 = \{a^m\ b^m\ c\ a^n\ b^m \mid m, n \geq 0\}$

$L_2 = \{a^i b^j c^k \mid i, j, k \geq 0\}$

Then L is

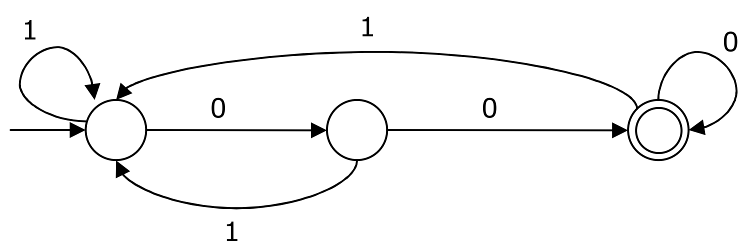
(A) Not recursive

(B) Regular

(C) Context free but not regular

(D) Recursively enumerable but not context free.

41.



The above DFA accepts the set of all strings over {0,1} that

(A) begin either with 0 or 1   (B) end with 0

(C) end with 00   (D) contain the substring 00.

42. Which of the following statements are TRUE?

I There exist parsing algorithms for some programming languages whose complexities are less than $\theta(n^3)$.

II A programming language which allows recursion can be implemented with static storage allocation.

III No L-attributed definition can be evaluated in the framework of bottom-up parsing.

IV Code improving transformations can be performed at both source language and intermediate code level.

(A) I and II   (B) I and IV   (C) III and IV   (D) I, III and IV

43. Consider two transactions T_1 and T_2, and four schedules S_1, S_2, S_3, S_4 of T_1 and T_2 as given below:

$T_1 : R_1[x] W_1[x] W_1[y]$
$T_2 : R_2[x] R_2[y] W_2[y]$
$S_1 : R_1[x] R_2[x] R_2[y] W_1[x] W_1[y] W_2[y]$
$S_2 : R_1[x] R_2[x] R_2[y] W_1[x] W_2[y] W_1[y]$
$S_3 : R_1[x] W_1[x] R_2[x] W_1[y] R_2[y] W_2[y]$
$S_4 : R_2[x] R_2[y] R_1[x] W_1[x] W_1[y] W_2[y]$

Which of the above schedules are conflict-serializable?

(A) S_1 and S_2 (B) S_2 and S_3 (C) S_3 only (D) S_4 only

44. The following key values are inserted into a B+ - tree in which order of the internal nodes is 3, and that of the leaf nodes is 2, in the sequence given below. The order of internal nodes is the maximum number of tree pointers in each node, and the order of leaf nodes is the maximum number of data items that can be stored in it. The B+ - tree is initially empty.

10, 3, 6, 8, 4, 2, 1

The maximum number of times leaf nodes would get split up as a result of these insertions is

(A) 2 (B) 3 (C) 4 (D) 5

45. Let R and S be relational schemes such that R={a,b,c} and S={c}. Now consider the following queries on the database:

I. $\pi_{R-S}(r) - \pi_{R-S}\left(\pi_{R-S}(r) \times s - \pi_{R-S,S}(r)\right)$

II. $\left\{t \mid t \in \pi_{R-S}(r) \wedge \forall u \in s\left(\exists v \in r\left(u = v[s] \wedge t = v[R-S]\right)\right)\right\}$

III. $\left\{t \mid t \in \pi_{R-S}(r) \wedge \forall v \in r\left(\exists u \in s\left(u = v[s] \wedge t = v[R-S]\right)\right)\right\}$

IV Select R.a, R.b
From R,S
Where R.c=S.c

Which of the above queries are equivalent?

(A) I and II (B) I and III (C) II and IV (D) III and IV

46. In the RSA public key cryptosystem, the private and public keys are (e,n) and (d,n) respectively, where n=p*q and p and q are large primes. Besides, n is public and p and q are private. Let M be an integer such that 0<M<n and $\phi(n) = (p-1)(q-1)$. Now consider the following equations.

I $M' = M^e \bmod n$
$M = (M')^d \bmod n$

II. $ed \equiv 1 \bmod n$

III. $ed \equiv 1 \bmod \phi(n)$

IV. $M' = M^e \bmod \phi(n)$
$M = (M')^d \bmod \phi(n)$

Which of the above equations correctly represent RSA cryptosystem?

(A) I and II (B) I and III (C) II and IV (D) III and IV

47. While opening a TCP connection, the initial sequence number is to be derived using a time-of-day (ToD) clock that keeps running even when the host is down. The low order 32 bits of the counter of the ToD clock is to be used for the initial sequence numbers. The clock counter increments once per millisecond. The maximum packet lifetime is given to be 64s.

Which one of the choices given below is closest to the minimum permissible rate at which sequence numbers used for packets of a connection can increase?

(A) 0.015/s (B) 0.064/s (C) 0.135/s (D) 0.327/s

48. Let G(x) be the generator polynomial used for CRC checking. What is the condition that should be satisfied by G(x) to detect odd number of bits in error?

(A) G(x) contains more than two terms

(B) G(x) does not divide $1+x^k$, for any k not exceeding the frame length

(C) 1+x is a factor of G(x)

(D) G(x) has an odd number of terms.

49. Which of the following statements are TRUE?

I The context diagram should depict the system as a single bubble.

II External entities should be identified clearly at all levels of DFDs.

III Control information should not be represented in a DFD.

IV A data store can be connected either to another data store or to an external entity.

(A) II and III (B) II and III (C) I and III (D) I, II and III

50. Consider the following statements about the cyclomatic complexity of the control flow graph of a program module. Which of these are TRUE?

I. The cyclomatic complexity of a module is equal to the maximum number of linearly independent circuits in the graph.

II. The cyclomatic complexity of a module is the number of decisions in the module plus one, where a decision is effectively any conditional statement in the module.

III. The cyclomatic complexity can also be used as a number of linearly independent paths that should be tested during path coverage testing.

(A) I and II (B) II and III (C) I and III (D) I, II and III

Common Data Questions: 51 & 52

A hard disk has 63 sectors per track, 10 platters each with 2 recording surfaces and 1000 cylinders. The address of a sector is given as a triple $\langle c,h,s \rangle$, where *c* is the cylinder number, *h* is the surface number and *s* is the sector number. Thus, the 0^{th} sector is addressed as $\langle 0,0,0 \rangle$, the 1^{st} sector as $\langle 0,0,1 \rangle$, and so on

51. The address <400, 16, 29> corre4sponds tp sector number:

(A) 505035 (B) 505036 (C) 505037 (D) 505038

52. The address of the 1039^{th} sector is

(A) $\langle 0,15,31\rangle$ (B) $\langle 0,16,30\rangle$ (C) $\langle 0,16,31\rangle$ (D) $\langle 0,17,31\rangle$

Common Data Questions: 53 & 54

A sub-sequence of a given sequence is just the given sequence with some elements (possibly none or all) left out. We are given two sequences X[m] and Y[n] of lengths m and n, respectively, with indexes of X and Y starting from 0.

53. We wish to find the length of the longest common sub-sequence (LCS) of X[m] and Y[n] as l(m,n), where an incomplete recursive definition for the function l(i,j) to compute the length of the LCS of X[m] and Y[n] is given below:

$l(i, j) = 0$, if either i=0 or j=0
= expr1, if i,j>0 and $X[i\text{-}1] = Y[j-1]$
= expr2, if i,j>0 and $X[i\text{-}1] = Y[j-1]$

Which one of the following options is correct?

(A) $\text{expr1} \equiv l(i-1, j)+1$
(B) $\text{expr1} \equiv l(i, j-1)$
(C) $\text{expr2} \equiv \max(l(i-1, j),\ l(i,j\text{-}1))$
(D) $\text{expr2} \equiv \max(l(i-1, j-1),\ l(i,j))$

54. The values of l(i,j) could be obtained by dynamic programming based on the correct recursive definition of l(i,j) of the form given above, using an array L[M,N], where M = m+1 and N=n+1, such that L[i,j] = l(i,j).

Which one of the following statements would be TRUE regarding the dynamic programming solution for the recursive definition of l(i,j)?

(A) All elements L should be initialized to 0 for the values of l(i,j) to be properly computed.
(B) The values of l(i,j) may be computed in a row major order or column major order of L(M,N).
(C) The values of l(i,j) cannot be computed in either row major order or column major order of L(M,N).
(D) L[p,q] needs to be computed before L[r,s] if either p<r or q<s.

Common Data Questions: 55 & 56

Consider the following relational schema:

Suppliers(sid:integer, sname:string, city:string, street:string)
Parts(pid:integer, pname:string, color:string)
Catalog(sid:integer, pid:integer, cost:real)

55. Consider the following relational query on the above database:

```
SELECT      S.sname
FROM        Suppliers S
WHERE S.sid NOT IN (SELECT C.sid
                     FROM Catalog C
                    WHERE C.pid NOT (SELECT  P.pid
                                     FROM    Parts P
                                     WHERE P.color<> 'blue'))
```

Assume that relations corresponding to the above schema are not empty. Which one of the following is the correct interpretation of the above query?

(A) Find the names of all suppliers who have supplied a non-blue part.

(B) Find the names of all suppliers who have not supplied a non-blue part.

(C) Find the names of all suppliers who have supplied only blue parts.

(D) Find the names of all suppliers who have not supplied only blue parts.

56. Assume that, in the suppliers relation above, each supplier and each street within a city has a unique name, and (sname, city) forms a candidate key. No other functional dependencies are implied other than those implied by primary and candidate keys. Which one of the following is TRUE about the above schema?

(A) The schema is in BCNF

(B) The schema is in 3NF but not in BCNF

(C) The schema is in 2NF but not in 3NF

(D) The schema is not in 2NF

Linked Answer Questions: Q.57 to Q.60 Carry Two Marks Each

Statement for Linked Answer Questions: 57 & 58

Frames of 1000 bits are sent over a 10^6 bps duplex link between two hosts. The propagation time is 25ms. Frames are to be transmitted into this link to maximally pack them in transit (within the link).

57. What is the minimum number of bits (l) that will be required to represent the sequence numbers distinctly? Assume that no time gap needs to be given between transmission of two frames.

(A) l=2 (B) l=3 (C) l=4 (D) l=5

58. Suppose that the sliding window protocol is used with the sender window size of 2^l, where l is the number of bits identified in the earlier part and acknowledgements are always piggy backed. After sending 2^l frames, what is the minimum time the sender will have to wait before starting transmission of the next frame? (Identify the closest choice ignoring the frame processing time.)

(A) 16ms (B) 18ms (C) 20ms (D) 22ms

Statement for Linked Answer Questions: 59 & 60

Consider a binary max-heap implemented using an array.

59. Which one of the following array represents a binary max-heap?

(A) $\{25,12,16,13,10,8,14\}$ (B) $\{25,14,13,16,10,8,12\}$

(C) $\{25,14,16,13,10,8,12\}$ (D) $\{25,14,12,13,10,8,16\}$

60. What is the content of the array after two delete operations on the correct answer to the previous question?

(A) $\{14,13,12,10,8\}$ (B) $\{14,12,13,8,10\}$

(C) $\{14,13,8,12,10\}$ (D) $\{14,13,12,8,10\}$

Q.1 – Q.20 Carry One Mark Each

1. $\lim_{x \to \infty} \frac{x - \sin x}{x + \cos x}$ equals

(A) 1 (B) -1 (C) ∞ (D) $-\infty$

2. If P, Q, R are subsets of the universal set U, then $(P \cap Q \cap R) \cup (P^c \cap Q \cap R) \cup Q^c \cup R^c$ is

(A) $Q^c \cup R^c$ (B) $P \cup Q^c \cup R^c$ (C) $P^c \cup Q^c \cup R^c$ (D) U

3. The following system of equations

$$x_1 + x_2 + 2x_3 = 1$$
$$x_1 + 2x_2 + 3x_3 = 2$$
$$x_1 + 4x_2 + \alpha x_3 = 4$$

has a unique solution. The only possible value(s) for α is/are

(A) 0 (B) either 0 or 1
(C) one of 0, 1 or -1 (D) any real number

4. In the IEEE floating point representation the hexadecimal value 0x00000000 corresponds to

(A) The normalized value 2^{-127} (B) The normalized value 2^{-126}
(C) The normalized value +0 (D) The special value +0

5. In the Karnaugh map shown below, X denotes a don't care term. What is the minimal form of the function represented by the Karnaugh map?

cd \ ab	00	01	11	10
00	1	1		1
01	X			
11	X			
10	1	1		X

(A) $\bar{b}.\bar{d} + \bar{a}.\bar{d}$ (B) $\bar{a}.\bar{b} + \bar{b}.\bar{d} + \bar{a}.b.\bar{d}$ (C) $\bar{b}.\bar{d} + \bar{a}.b.\bar{d}$ (D) $\bar{a}.\bar{b} + \bar{b}.\bar{d} + \bar{a}.\bar{d}$

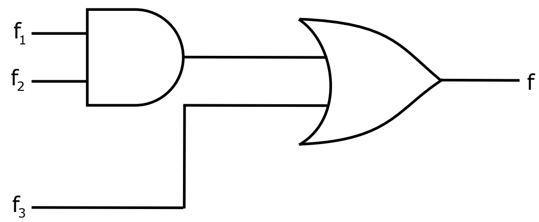
6. Let r denote number system radix. The only value(s) of r that satisfy the equation $\sqrt{121_r} = 11_r$ is / are

(A) decimal 10 (B) decimal 11
(C) decimal 10 and 11 (D) any value >2

7. The most efficient algorithm for finding the number of connected components in an undirected graph on n vertices and m edges has time complexity

(A) $\Theta(n)$ (B) $\Theta(m)$ (C) $\Theta(m+n)$ (D) $\Theta(mn)$

8. Given f_1, f_3 and f in canonical sum of products form (in decimal) for the circuit



$f_1 = \Sigma m(4,5,6,7,8)$
$f_3 = \Sigma m(1,6,15)$
$f = \Sigma m(1,6,8,15)$
then f_2 is

(A) $\Sigma m(4,6)$ (B) $\Sigma m(4,8)$ (C) $\Sigma m(6,8)$ (D) $\Sigma m(4,6,8)$

9. Which of the following is true for the language $\{a^p \mid p \text{ is a prime}\}$?

(A) It is not accepted by a Turing Machine
(B) It is regular but not context-free
(C) It is context-free but not regular
(D) It is neither regular nor context-free, but accepted by a Turing machine

10. Which of the following are decidable?

I. Whether the intersection of two regular languages is infinite
II. Whether a given context-free language is regular
III. Whether two push-down automata accept the same language
IV. Whether a given grammar is context-free

(A) I and II (B) I and IV (C) II and III (D)II and IV

11. Which of the following describes a handle (as applicable to LR-parsing) appropriately?

(A) It is the position in a sentential form where the next shift or reduce operation will occur
(B) It is non-terminal whose production will be used for reduction in the next step
(C) It is a production that may be used for reduction in a future step along with a position in the sentential form where the next shift or reduce operation will occur
(D) It is the production p that will be used for reduction in the next step along with a position in the sentential form where the right hand side of the production may be found

12. Some code optimizations are carried out on the intermediate code because
(A) They enhance the portability of the compiler to other target processors
(B) Program analysis is more accurate on intermediate code than on machine code
(C) The information from dataflow analysis cannot otherwise be used for optimization
(D) The information from the front end cannot otherwise be used for optimization

13. If L and $\bar{L}$ are recursively enumerable then L is
(A) regular (B) context-free
(C) context-sensitive (D) recursive

14. What is the maximum size of data that the application layer can pass on to the TCP layer below?
(A) Any size (B) 2^{16} bytes-size of TCP header
(C) 2^{16} bytes (D) 1500 bytes

15. Which of the following tuple relational calculus expression(s) is/are equivalent to $\forall t \in r\left(P(t)\right)$?

I. $\neg\exists t \in r\left(P(t)\right)$

II. $\exists t \notin r\left(P(t)\right)$

III. $\neg\exists t \in r\left(\neg P(t)\right)$

IV. $\exists t \notin r\left(\neg P(t)\right)$

(A) I only (B) II only
(C) III only (D) III and IV only

16. A clustering index is defined on the fields which are of type
(A) non-key and ordering (B) non-key and non-ordering
(C) key and ordering (D) key and non-ordering

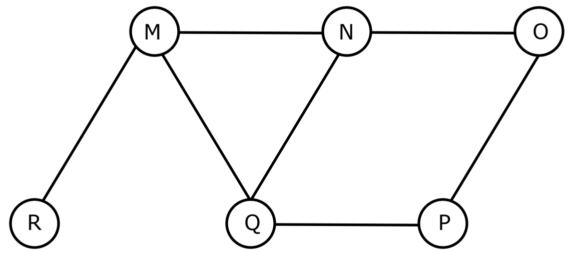
17. Which of the following system calls results in the sending of SYN packets?
(A) socket (B) bind (C) listen (D) connect

18. Which combination of the integer variables x, y and z makes the variable a get the value 4 in the following expression?

$a = (x > y)?((x > z)?x : z) : ((y > z)?y : z)$

(A) $x = 3, y = 4, z = 2$ (B) $x = 6, y = 5, z = 3$
(C) $x = 6, y = 3, z = 5$ (D) $x = 5, y = 4, z = 5$

19. The Breadth First Search algorithm has been implemented using the queue data structure. One possible order of visiting the nodes of the following graph is



(A) MNOPQR (B) NQMPOR (C) QMNPRO (D) QMNPOR

20. The data blocks of a very large file in the Unix file system are allocated using
(A) contiguous allocation
(B) linked allocation
(C) indexed allocation
(D) an extension of indexed allocation

Q.21 – Q.75 Carry Two Marks Each

21. The minimum number of equal length subintervals needed to approximate $\int_1^2 xe^x dx$ to an accuracy of at least $\frac{1}{3} \times 10^{-6}$ using the trapezoidal rule is
(A) 1000e (B) 1000 (C) 100e (D) 100

22. The Newton-Raphson iteration $x_{n+1} = \frac{1}{2}\left(x_n + \frac{R}{x_n}\right)$ can be used to compute the
(A) square of R (B) reciprocal of R
(C) square root of R (D) logarithm of R

23. Which of the following statements is true for every planar graph on n vertices?
(A) The graph is connected
(B) The graph is Eulerian
(C) The graph has a vertex-cover of size at most 3n/4
(D) The graph has an independent set of size at least n/3

24. Let $P = \sum_{\substack{1 \le i \le 2k \\ i \text{ odd}}} i$ and $Q = \sum_{\substack{1 \le i \le 2k \\ i \text{ even}}} i$, where k is a positive integer. Then
(A) $P = Q - K$ (B) $P = Q + K$ (C) $P = Q$ (D) $P = Q + 2K$

25. A point on a curve is said to be an extremum if it is a local minimum or a local maximum. The number of distinct extrema for the curve $3x^4 - 16x^3 + 24x^2 + 37$ is

(A) 0 (B) 1 (C) 2 (D) 3

26. If P, Q, R are Boolean variables, then

$(P + \overline{Q})(P.\overline{Q} + P.R)(\overline{P}.\overline{R} + \overline{Q})$

Simplifies to

(A) $P.\overline{Q}$ (B) $P.\overline{R}$ (C) $P.\overline{Q} + R$ (D) $P.\overline{R} + Q$

27. Aishwarya studies either computer science or mathematics everyday. If she studies computer science on a day, then the probability that the studies mathematics the next day is 0.6. If she studies mathematics on a day, then the probability that the studies computer science the next day is 0.4. Given that Aishwarya studies computer science on Monday, what is the probability that she studies computer science on Wednesday?

(A) 0.24 (B) 0.36 (C) 0.4 (D) 0.6

28. How many of the following matrices have an eigenvalue 1?

$\begin{bmatrix} 1 & 0 \\ 0 & 0 \end{bmatrix} \begin{bmatrix} 0 & 1 \\ 0 & 0 \end{bmatrix} \begin{bmatrix} 1 & -1 \\ 1 & 1 \end{bmatrix} \text{and} \begin{bmatrix} -1 & 0 \\ 1 & -1 \end{bmatrix}$

(A) one (B) two (C) three (D) four

29. Let X be a random variable following normal distribution with mean +1 and variance 4. Let Y be another normal variable with mean -1 and variance unknown. If $P(X \le -1) = P(Y \ge 2)$, the standard deviation of Y is

(A) 3 (B) 2 (C) $\sqrt{2}$ (D) 1

30. Let fsa and pda be two predicates such that fsa(x) means x is a finite state automaton, and pda(y) means that y is a pushdown automaton. Let equivalent be another predicate such that equivalent (a, b) means a and b are equivalent. Which of the following first order logic statements represents the following:

Each finite state automaton has an equivalent pushdown automaton

(A) $(\forall x \text{ fsa}(x)) \Rightarrow (\exists y \text{ pda}(y) \wedge \text{equivalent}(x, y))$

(B) $\sim \forall y (\exists x \text{ fsa}(x) \Rightarrow \text{pda}(y) \wedge \text{equivalent}(x, y))$

(C) $\forall x \exists y (\text{fsa}(x) \wedge \text{pda}(y) \wedge \text{equivalent}(x, y))$

(D) $\forall x \exists y (\text{fsa}(y) \wedge \text{pda}(x) \wedge \text{equivalent}(x, y))$

31. P and Q are two propositions. Which of the following logical expressions are equivalent?

I. $P \vee \sim Q$

II. $\sim (\sim P \wedge Q)$

III. $(P \wedge Q) \vee (P \wedge \sim Q) \vee (\sim P \wedge \sim Q)$

IV. $(P \wedge Q) \vee (P \wedge \sim Q) \vee (\sim P \wedge Q)$

(A) Only I and II
(B) Only I, II and III
(C) Only I, II and IV
(D) All of I, II III and IV

32. For a magnetic disk with concentric circular tracks, the seek latency is not linearly proportional to the seek distance due to

(A) non-uniform distribution of requests
(B) arm starting and stopping inertia
(C) higher capacity of tracks on the periphery of the platter
(D) use of unfair arm scheduling policies

33. Which of the following is/are true of the auto-increment addressing mode?

I. It is useful in creating self-relocating code

II. If it is included in an Instruction Set Architecture, then an additional ALU is required for effective address calculation

III. The amount of increment depends on the size of the data item accessed

(A) I only
(B) II only
(C) III only
(D) II and III only

34. Which of the following must be true for the RFE (Return From Exception) instruction on a general purpose processor?

I. It must be a trap instruction

II. It must be a privileged instruction

III. An exception cannot be allowed to occur during execution of an RFE instruction

(A) I only
(B) II only
(C) I and II only
(D) I, II and III only

35. For inclusion to hold between two cache levels L1 and L2 in a multi-level cache hierarchy, which of the following are necessary?

I. L1 must be a write-through cache

II. L2 must be a write-through cache

III. The associativity of L2 must be greater than that of L1

IV. The L2 cache must be at least as large as the L1 cache

(A) IV only
(B) I and IV only
(C) I, II and IV only
(D) I, II, III and IV

36. Which of the following are NOT true in a pipelined processor?

I. Bypassing can handle all RAW hazards

II. Register renaming can eliminate all register carried WAR hazards

III. Control hazard penalties can be eliminated by dynamic branch prediction

(A) I and II only (B) I and III only (C) II and III only (D) I, II and III

37. The use of multiple register windows with overlap causes a reduction in the number of memory accesses for

I. Function locals and parameters

II. Register saves and restores

III. Instruction fetches

(A) I only (B) II only (C) III only (D) I, II and III

38. In an instruction execution pipeline, the earliest that the data TLB (Translation Lookaside Buffer) can be accessed is

(A) Before effective address calculation has started

(B) During effective address calculation

(C) After effective address calculation has completed

(D) After data cache lookup has completed

39. Consider the following functions:

$f(n) = 2^n$

$g(n) = n!$

$h(n) = n^{\log n}$

Which of the following statements about the asymptotic behaviour of f(n), g(n), and h(n) is true?

(A) $f(n) = O(g(n));\ g(n) = O(h(n))$ (B) $f(n) = \Omega(g(n));\ g(n) = O(h(n))$

(C) $g(n) = O(f(n));\ h(n) = O(f(n))$ (D) $h(n) = O(f(n));\ g(n) = \Omega(f(n))$

40. The minimum number of comparisons required to determine if an integer appears more than n/2 times in a sorted array of n integers is

(A) $\Theta(n)$ (B) $\Theta(\log n)$ (C) $\Theta(\log^* n)$ (D) $\Theta(1)$

41. A B-tree of order 4 is built from scratch by 10 successive insertions. What is the maximum number of node splitting operations that may take place?

(A) 3 (B) 4 (C) 5 (D) 6

42. G is a graph on n vertices and 2n-2 edges. The edges of G can be partitioned into two edge-disjoint spanning trees. Which of the following is NOT true for G?

(A) For every subset of k vertices, the induced subgraph has at most 2k-2 edges

(B) The minimum cut in G has at least two edges

(C) There are two edge-disjoint paths between every pair of vertices

(D) There are two vertex-disjoint paths between every pair of vertices

43. Consider the Quicksort algorithm. Suppose there is a procedure for finding a pivot element which splits the list into two sub-lists each of which contains at least one-fifth of the elements. Let T(n) be the number of comparisons required to sort n elements. Then

(A) $T(n) \le 2T(n/5) + n$

(B) $T(n) \le T(n/5) + T(4n/5) + n$

(C) $T(n) \le 2T(4n/5) + n$

(D) $T(n) \le 2T(n/2) + n$

44. The subset-sum problem is defined as follows: Given a set S of n positive integers and a positive integer W, determine whether there is a subset of S Whose elements sum to W.

An algorithm Q solves this problem in O(nW) time. Which of the following statements is false?

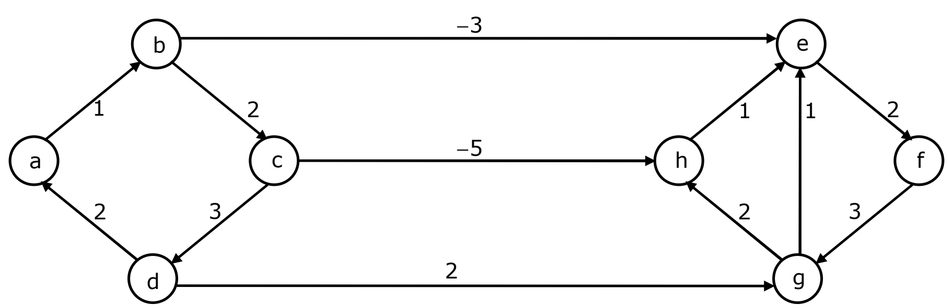
(A) Q solves the subset-sum problem in polynomial time when the input is encoded in unary

(B) Q solves the subset-sum problem in polynomial time when the input is encoded in binary

(C) The subset sum problem belongs to the class NP

(D) The subset sum problem is NP-hard

45.



Dijkstra's single source shortest path algorithm when run from vertex *a* in the above graph, computes the correct shortest path distance to

(A) only vertex a

(B) only vertices a, e, f, g, h

(C) only vertices a, b, c, d

(D) all the vertices

46. You are given the postorder traversal, P, of a binary search tree on the n elements 1, 2,….,n. You have to determine the unique binary search tree that has P as its postorder traversal. What is the time complexity of the most efficient algorithm for doing this?

(A) $\Theta(\log n)$

(B) $\Theta(n)$

(C) $\Theta(n \log n)$

(D) None of the above, as the tree cannot be uniquely determined

47. We have a binary heap on n elements and wish to insert n more elements (not necessarily one after another) into this heap. The total time required for this is

(A) $\Theta(\log n)$ (B) $\Theta(n)$ (C) $\Theta(n \log n)$ (D) $\Theta(n^2)$

48. Which of the following statements is false?

(A) Every NFA can be converted to an equivalent DFA

(B) Every non-deterministic Turing machine can be converted to an equivalent deterministic Turing machine

(C) Every regular language is also a context-free language

(D) Every subset of a recursively enumerable set is recursive

49. Given below are two finite state automata ($\rightarrow$ indicates the start state and F indicates a final state)

Y:

	a	b
$\rightarrow 1$	1	2
2(F)	2	1

Z:

	a	b
$\rightarrow 1$	2	2
2(F)	1	1

Which of the following represents the product automaton $Z \times Y$?

(A)

	a	b
$\rightarrow P$	S	R
Q	R	S
R(F)	Q	P
S	Q	P

(B)

	a	b
$\rightarrow P$	S	Q
Q	R	S
R(F)	Q	P
S	P	Q

(C)

	a	b
$\rightarrow P$	Q	S
Q	R	S
R(F)	Q	P
S	Q	P

(D)

	a	b
$\rightarrow P$	S	Q
Q	S	R
R(F)	Q	P
S	Q	P

50. Which of the following statements are true?

I. Every left-recursive grammar can be converted to a right-recursive grammar and vice-versa

II. All ε-productions can be removed from any context-free grammar by suitable transformations

III. The language generated by a context-free grammar all of whose productions are of the form $X \rightarrow w$ or $X \rightarrow wY$ (where, w is a string of terminals and Y is a non-terminal), is always regular

IV. The derivation trees of strings generated by a context-free grammar in Chomsky Normal Form are always binary trees

(A) I, II, III and IV (B) II, III and IV only

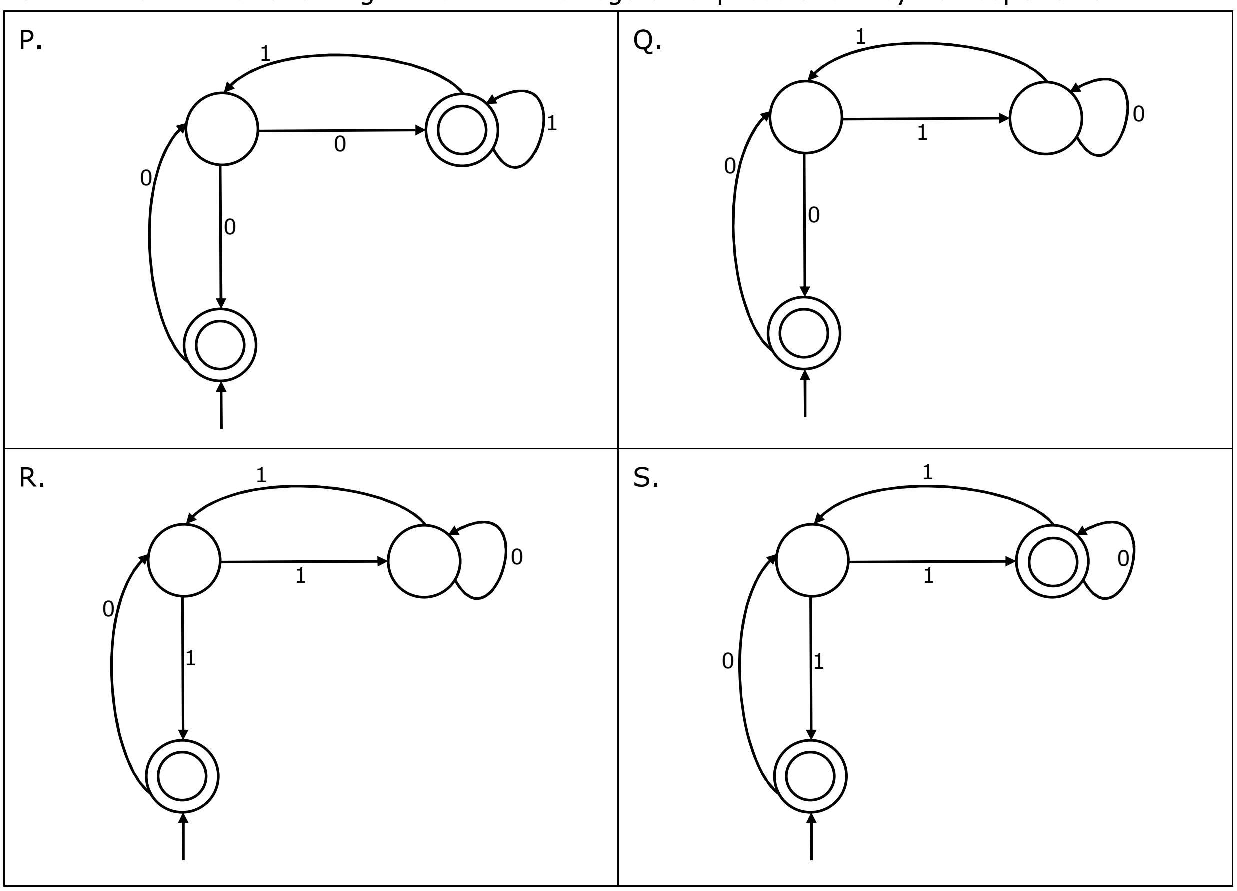
(C) I, III and IV only (D) I, II and IV only

51. Match the following:

E.	Checking that identifiers are declared before their use	P.	$L = \{a^n b^m c^n d^m \mid n \geq 1, m \geq 1\}$
F.	Number of formal parameters in the declaration of a function agrees with the number of actual parameters in use of that function	Q.	$X \rightarrow XbX \mid XcX \mid dXf \mid g$
G.	Arithmetic expressions with matched pairs of parentheses	R.	$L = \{wcw \mid w \in (a \mid b)^*\}$
H.	Palindromes	S.	$X \rightarrow bXb \mid cXc \mid \varepsilon$

(A) E – P, F – R, G – Q, H – S
(B) E – R, F – P, G – S, H – Q
(C) E – R, F – P, G – Q, H – S
(D) E – P, F – R, G – S, H – Q

52. Match the following NFAs with the regular expressions they correspond to



1. $\varepsilon + 0(01^*1 + 00)^*01^*$
2. $\varepsilon + 0(10^*1 + 00)^*0$
3. $\varepsilon + 0(10^*1 + 10)^*1$
4. $\varepsilon + 0(10^*1 + 10)^*10^*$

(A) P – 2, Q – 1, R – 3, S – 4 (B) P – 1, Q – 3, R – 2, S – 4

(C) P – 1, Q – 2, R – 3, S – 4 (D) P – 3, Q – 2, R – 1, S – 4

53. Which of the following are regular sets?

I. $\{a^n b^{2m} \mid n \geq 0, m \geq 0\}$

II. $\{a^n b^m \mid n = 2m\}$

III. $\{a^n b^m \mid n \neq m\}$

IV. $\{xcy \mid x, y, \in \{a, b\}^*\}$

(A) I and IV only (B) I and III only (C) I only (D) IV only

54. Which of the following are true?

I. A programming language which does not permit global variables of any kind and has no nesting of procedures/functions, but permits recursion can be implemented with static storage allocation

II. Multi-level access link (or display) arrangement is needed to arrange activation records only if the programming language being implemented has nesting of procedures/functions

III. Recursion in programming languages cannot be implemented with dynamic storage allocation

IV. Nesting procedures/functions and recursion require a dynamic heap allocation scheme and cannot be implemented with a stack-based allocation scheme for activation records

V. Programming languages which permit a function to return a function as its result cannot be implemented with a stack-based storage allocation scheme for activation records

(A) II and V only (B) I, III and IV only

(C) I, II and V only (D) II, III and V only

55. An LALR(1) parser for a grammar G can have shift-reduce (S-R) conflicts if and only if

(A) The SLR(1) parser for G has S-R conflicts

(B) The LR(1) parser for G has S-R conflicts

(C) The LR(0) parser for G has S-R conflicts

(D) The LALR(1) parser for G has reduce-reduce conflicts

56. In the slow start phase of the TCP congestion control algorithm, the size of the congestion window

(A) does not increase (B) increases linearly

(C) increases quadratically (D) increases exponentially

57. If a class B network on the Internet has a subnet mask of 255.255.248.0, what is the maximum number of hosts per subnet?

(A) 1022 (B) 1023 (C) 2046 (D) 2047

58. A computer on a 10Mbps network is regulated by a token bucket. The token bucket is filled at a rate of 2Mbps. It is initially filled to capacity with 16Megabits. What is the maximum duration for which the computer can transmit at the full 10Mbps?

(A) 1.6 seconds (B) 2 seconds (C) 5 seconds (D) 8 seconds

59. A client process P needs to make a TCP connection to a server process S. Consider the following situation: the server process S executes a socket (), a bind () and a listen () system call in that order, following which it is preempted. Subsequently, the client process P executes a socket () system call followed by connect () system call to connect to the server process S. The server process has not executed any accept () system call. Which one of the following events could take place?

(A) connect () system call returns successfully

(B) connect () system call blocks

(C) connect () system call returns an error

(D) connect () system call results in a core dump

60. What is printed by the following C program?

```
int f(int x, int *py, int **ppz)
{
    int y, z;
    **ppz += 1; z = *ppz;
    *py += 2; y = *py;
    x += 3;
    return x + y + z;
}
```

```
void main( )
{
    int c, *b, **a;
    c = 4; b = &c; a = &b;
    printf("%d", f(c,b,a));
}
```

(A) 18 (B) 19 (C) 21 (D) 22

61. Choose the correct option to fill ? 1 and ? 2 so that the program below prints an input string in reverse order. Assume that the input string is terminated by a newline character.

```
void recerse(void){
    int c;
    if(?1)reverse( );
    ?2
}
main( ){
    printf("Enter Text"); printf("\n");
    reverse( );printf("\n");
}
```

(A) ?1 is (getchar( ) != '\n')

?2 is getchar(c);

(B) ?1 is (c = getchar( )) != '\n')

?2 is getchar(c);

(C) ?1 is (c != '\n')

?2 is putchar(c);

(D) ?1 is ((c = getchar( )) != '\n')

?2 is putchar(c);

62. The following C function takes a single-linked list of integers as a parameter and rearranges the elements of the list. The function is called with the list containing the integers 1,2,3,4,5,6,7 in the given order. What will be the contents of the list after the function completes execution?

```
struct node {
    int value;
    struct node *next;
};
Void rearrange(struct node *list){
    struct node *p, *q;
    int temp;
    if(!list || !list->next)return;
    p = list; q = list->next;
    while(q){
        temp = p->value;p->value = q->value;
        q->value = temp;p = q->next;
        q = p?p->next : 0;
    }
}
```

(A) 1,2,3,4,5,6,7 (B) 2,1,4,3,6,5,7 (C) 1,3,2,5,4,7,6 (D) 2,3,4,5,6,7,1

63. The P and V operations on counting semaphores, where s is a counting semaphore, are defined as follows:

```
P(s) : s = s – 1;
       ifs < 0 then wait;
V(s) : s = s + 1;
       ifs <= 0 then wakeup a process waiting on s;
```

Assume that P_b and V_b the wait and signal operations on binary semaphores are provided. Two binary semaphores x_b and y_b are used to implement the semaphore operations P(s) and V(s) as follows:

$P(s):\ \ P_b(x_b);$
$\quad s = s - 1;$
$\quad \text{if} \ \ (s < 0) \ \ \{$
$\qquad V_b(x_b);$
$\qquad P_b(y_b);$
$\quad \}$
$\quad \text{else} \ \ V_b(x_b);$

$V(s):\ \ P_b(x_b);$
$\quad s = s + 1;$
$\quad \text{if} \ \ (s <= 0) \ \ V_b(y_b);$
$\qquad V_b(x_b);$

The initial values of x_b and y_b are respectively

(A) 0 and 0 (B) 0 and 1 (C) 1 and 0 (D) 1 and 1

64. Which of the following statements about synchronous and asynchronous I/O is NOT true?
(A) An ISR is invoked on completion of I/O in synchronous I/O but not in asynchronous I/O
(B) In both synchronous and asynchronous I/O, an ISR (Interrupt Service Routine) is invoked after completion of the I/O
(C) A process making a synchronous I/O call waits until I/O is complete, but a process making an asynchronous I/O call does not wait for completion of the I/O
(D) In the case of synchronous I/O, the process waiting for the completion of I/O is woken up by the ISR that is invoked after the completion of I/O

65. Which of the following is NOT true of deadlock prevention and deadlock avoidance schemes?
(A) In deadlock prevention, the request for resources is always granted if the resulting state is safe
(B) In deadlock avoidance, the request for resources is always granted if the result state is safe
(C) Deadlock avoidance is less restrictive than deadlock prevention
(D) Deadlock avoidance requires knowledge of resource requirements a priori

66. A process executes the following code

$\text{for}(i = 0;\ \ i < n;\ \ i++)\,\text{for}(\ \ );$

The total number of child processes created is

(A) n (B) $2^n - 1$ (C) 2^n (D) $2^{n+1} - 1$

67. A processor uses 36 bit physical addresses and 32 bit virtual addresses, with a page frame size of 4 Kbytes. Each page table entry is of size 4 bytes. A three level page table is used for virtual to physical address translation, where the virtual address is used as follows

- Bits 30-31 are used to index into the first level page table
- Bits 21-29 are used to index into the second level page table
- Bits 12-20 are used to index into the third level page table, and
- Bits 0-11 are used as offset within the page

The number of bits required for addressing the next level page table (or page frame) in the page table entry of the first, second and third level page tables are respectively

(A) 20, 20 and 20 (B) 24, 24 and 24 (C) 24, 24 and 20 (D) 25, 25 and 24

68. Let R and S be two relations with the following schema

$R(\underline{P}, \underline{Q}, R1, R2, R3)$

$S(\underline{P}, \underline{Q}, S1, S2)$

Where {P, Q} is the key for both schemas. Which of the following queries are equivalent?

I. $\Pi_P(R \bowtie S)$

II. $\Pi_P(R) \bowtie \Pi_P(S)$

III. $\Pi_P(\Pi_{P,Q}(R) \cap \Pi_{P,Q}(S))$

IV. $\Pi_P(\Pi_{P,Q}(R) - (\Pi_{P,Q}(R) - \Pi_{P,Q}(S)))$

(A) Only I and II (B) Only I and III

(C) Only I, II and III (D) Only I, III and IV

69. Consider the following relational schemes for a library database:

Book (Title, Author, Catalog_no, Publisher, Year, Price)

Collection (Title, Author, Catalog_no)

with in the following functional dependencies:

I. Title Author $\rightarrow$ Catalog_no

II. Catalog_no $\rightarrow$ Title Author Publisher Year

III. Publisher Title Year $\rightarrow$ Price

Assume {Author, Title} is the key for both schemes. Which of the following statements is true?

(A) Both Book and Collection are in BCNF

(B) Both Book and Collection are in 3NF only

(C) Book is in 2NF and Collection is in 3NF

(D) Both Book and Collection are in 2NF only

70. Consider a file of 16384 records. Each record is 32 bytes long and its key field is of size 6 bytes. The file is ordered on a non-key field, and the file organization is unspanned. The file is stored in a file system with block size 1024 bytes, and the size of a block pointer is 10 bytes. If the secondary index is built on the key field of the file, and a multi-level index scheme is used to store the secondary index, the number of first-level and second-level blocks in the multi-level index are respectively

(A) 8 and 0 (B) 128 and 6 (C) 256 and 4 (D) 512 and 5

Common Data for Questions: 71 72 and 73

Consider a machine with a 2-way set associative data cache of size 64Kbytes and block size 16bytes. The cache is managed using 32 bit virtual addresses and the page size is 4Kbyts. A program to be run on this machine begins as follows:

```
double ARR[1024] [1024];
int i, j ;
  /* Initialize array ARR to 0.0 */
   for(i = 0;i < 1024; i++)
     for(j = 0; j < 1024; j++)
       ARR[i] [j] = 0.0;
```

The size of double is 8Bytes. Array ARR is located in memory starting at the beginning of virtual page 0xFF000 and stored in row major order. The cache is initially empty and no pre-fetching is done. The only data memory references made by the program are those to array ARR

71. The total size of the tags in the cache directory is

(A) 32Kbits (B) 34Kbits (C) 64Kbits (D) 68Kbits

72. Which of the following array elements has the same cache index as ARR [0] [0]?

(A) ARR [0] [4] (B) ARR [4] [0] (C) ARR [0] [5] (D) ARR [5] [0]

73. The cache hit ratio for this initialization loop is

(A) 0% (B) 25% (C) 50% (D) 75%

Common Data for Questions: 74 and 75

Consider the following C functions:

```
int  f1  ( int n )
{
   if (n == 0| |n == 1)
      return n;
   else
      return(2 * f1(n – 1) + 3 * f1(n – 2));
}
int  f2  ( int n )
{
  int  i;
  int  X[N],  Y[N],  Z[N];

  X[0] = Y[0] = Z[0] = 0;
  X[1] = 1;  Y[1] = 2;  Z[1] = 3;
  for(i = 2;  i <= n;  i ++) {
     X[i] = Y[i – 1] + Z[i – 2];
     Y[i] = 2 * X[i];
     Z[i] = 3 * X[i];
   }
   return  X[n];
}
```

74. The running time of f1 (n) and f2 (n) are

(A) $\Theta(n)$ and $\Theta(n)$

(B) $\Theta(2^n)$ and $\Theta(n)$

(C) $\Theta(n)$ and $\Theta(2^n)$

(D) $\Theta(2^n)$ and $\Theta(2^n)$

75. F1 (8) and f2 (8) return the values

(A) 1661 and 1640

(B) 59 and 59

(C) 1640 and 1640

(D) 1640 and 1661

Linked Answer Questions: Q.76 to 85 Carry Two Marks Each

Statement for Linked Answer Questions: 76 & 77

Delayed branching can help in the handling of control hazards

76. For all delayed conditional branch instructions, irrespective of whether the condition evaluates to true or false

(A) The instruction following the conditional branch instruction in memory is executed

(B) The first instruction in the fall through path is executed

(C) The first instruction in the taken path is executed

(D) The branch takes longer to execute than any other instruction

77. The following code is to run on a pipelined processor with one branch delay slot:

I1 : ADD $R2 \leftarrow R7 + R8$

I2 : SUB $R4 \leftarrow R5 - R6$

I3 : ADD $R1 \leftarrow R2 + R3$

I4 : STORE Memory $[R4] \leftarrow R1$

BRANCH to Label if $R1 == 0$

Which of the instructions I1, I2, I3 or I4 can legitimately occupy the delay slot without any other program modification?

(A) I1 (B) I2 (C) I3 (D) I4

Statement for Linked Answer Questions: 78 & 79

Let x_n denote the number of binary strings of length n that contain no consecutive 0s.

78. Which of the following recurrences does x_n satisfy?

(A) $x_n = 2x_{n-1}$ (B) $x_n = x_{\lfloor n/2 \rfloor} + 1$ (C) $x_n = x_{\lfloor n/2 \rfloor} + n$ (D) $x_n = x_{n-1} + x_{n-2}$

79. The value of x_5 is

(A) 5 (B) 7 (C) 8 (D) 16

Statement for Linked Answer Questions: 80 & 81

The subset-sum problem is defined as follows. Given a set of n positive integers, $S = \{a_1, a_2, a_3, \ldots, a_n\}$, and positive integer W, is there a subset of S whose elements sum to W? A dynamic program for solving this problem uses a 2-dimensional Boolean array, X, with n rows and W+1 columns.

$X[i, j], 1 \le i \le n, 0 \le j \le W,$ is TRUE if and only if there is a subset of $\{a_1, a_2, ..., a_i\}$ whose elements sum to j.

80. Which of the following is valid for $2 \le i \le n$ and $a_i \le j \le W$?

(A) $X[i, j] = X[i-1, j] \vee X[i, j-a_i]$ (B) $X[i, j] = X[i-1, j] \vee X[i-1, j-a_i]$

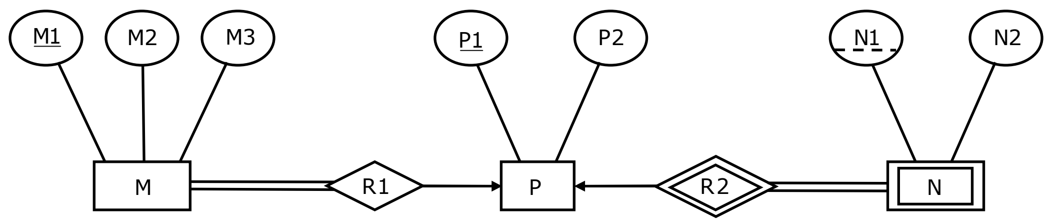
(C) $X[i, j] = X[i-1, j] \wedge X[i, j-a_i]$ (D) $X[i, j] = X[i-1, j] \wedge X[i-1, j-a_i]$

81. Which entry of the array X, if TRUE, implies that there is a subset whose elements sum to W?

(A) $X[1, W]$ (B) $X[n, 0]$ (C) $X[n, W]$ (D) $X[n-1, n]$

Statement for Linked Answer Questions: 82 & 83

Consider the following ER diagram



82. The minimum number of tables needed to represent M, N, P, R1, R2 is

(A) 2 (B) 3 (C) 4 (D) 5

83. Which of the following is a correct attribute set for one of the tables for the correct answer to the above question?

(A) $\{M1, M2, M3, P1\}$ (B) $\{M1, P1, N1, N2\}$ (C) $\{M1, P1, N1\}$ (D) $\{M1, P1\}$

Statement for Linked Answer Questions: 84 & 85

Consider the following C program that attempts to locate an element x in an array Y[ ] using binary search. The program is erroneous.

```
f(int Y[10], int x) {
   int u, j, k;
   i = 0; j = 9;
   do {
         k = (i + j) / 2;
         if (Y[k] < x) i = k; else j = k;
      } while ((Y[k] != x) && (i < j));
   if (Y[k] == x) printf("x is in the array");
   else printf("x is not in the array");
}
```

84. On which of the following contents of Y and x does the program fail?

(A) Y is $[1\ 2\ 3\ 4\ 5\ 6\ 7\ 8\ 9\ 10]$ and $x < 10$

(B) Y is $[1\ 3\ 5\ 7\ 9\ \ 11\ \ 13\ \ 15\ \ 17\ 19]$ and $x < 1$

(C) Y is $[2\ 2\ 2\ 2\ 2\ 2\ 2\ 2\ 2\ 2]$ and $x > 2$

(D) Y is $[2\ 4\ 6\ 8\ 10\ 12\ 14\ 16\ 18\ 20]$ and $2 < x < 20$ and x is even

85. The correction needed in the program to make it work properly is

(A) Change line 6 to: $\text{if}\,(Y[k] < x)\ \ i = k + 1;\ \ \text{else}\ j = k - 1;$

(B) Change line 6 to: $\text{if}\,(Y[k] < x)\ \ i = k - 1;\ \ \text{else}\ j = k + 1;$

(C) Change line 6 to: $\text{if}\,(Y[k] <= x)\ \ i = k;\ \ \text{else}\ j = k;$

(D) Change line 7 to: $\}\ \text{while}\ ((Y[k] == x)\ \&\&\ (i < j));$

Q.1 – Q.20 Carry One Mark Each

1. Consider the following two statements about the function $f(x) = |x|$:

   P. $f(x)$ is continuous for all real values of x

   Q. $f(x)$ is differentiable for all real values of x

   Which of the following is TRUE?

   (A) P is true and Q is false. (B) P is false and Q is true.

   (C) Both P and Q are true. (D) Both P and Q are false.

2. Let S be a set of n elements. The number of ordered pairs in the largest and the smallest equivalence relations on S are:

   (A) n and n (B) n^2 and n (C) n^2 and 0 (D) n and 1

3. What is the maximum number of different Boolean functions involving n Boolean variables?

   (A) n^2 (B) 2^n (C) 2^{2^n} (D) 2^{n^2}

4. Let G be the non-planar graph with the minimum possible number of edges. Then G has

   (A) 9 edges and 5 vertices (B) 9 edges and 6 vertices

   (C) 10 edges and 5 vertices (D) 10 edges and 6 vertices

5. Consider the DAG with $V = \{1, 2, 3, 4, 5, 6\}$, shown below.

   Which of the following is NOT a topological ordering?

   (A) 1 2 3 4 5 6 (B) 1 3 2 4 5 6 (C) 1 3 2 4 6 5 (D) 3 2 4 1 6 5

6. Which of the following problems is undecidable?

   (A) Membership problem for CFGs. (B) Ambiguity problem for CFGs.

   (C) Finiteness problem for FSAs. (D) Equivalence problem for FSAs.

7. Which of the following is TRUE?

(A) Every subset of a regular set is regular.

(B) Every finite subset of a non-regular set is regular.

(C) The union of two non-regular sets is not regular.

(D) Infinite union of finite sets is regular.

8. How many 3-to-8 line decoders with an enable input are needed to construct a 6-to-64 line decoder without using any other logic gates?

(A) 7 (B) 8 (C) 9 (D) 10

9. Consider the following Boolean function of four variables:

$$f(w,x,y,z) = \sum(1,3,4,6,9,11,12,14)$$

The function is:

(A) independent of one variables. (B) independent of two variables.

(C) independent of three variables. (D) dependent on all the variables.

10. Consider a 4-way set associative cache consisting of 128 lines with a line size of 64 words. The CPU generates a 20-bit address of a word in main memory. The number of bits in the TAG, LINE and WORD fields are respectively:

(A) 9, 6, 5 (B) 7, 7, 6 (C) 7, 5, 8 (D) 9, 5, 6

11. Consider a disk pack with 16 surfaces, 128 tracks per surface and 256 sectors per track. 512 bytes of data are stored in a bit serial manner in a sector. The capacity of the disk pack and the number of bits required to specify a particular sector in the disk are respectively:

(A) 256 Mbyte, 19 bits (B) 256 Mbyte, 28 bits

(C) 512 Mbyte, 20 bits (D) 64 Gbyte, 28 bits

12. The height of a binary tree is the maximum number of edges in any root to leaf path. The maximum number of nodes in a binary tree of height h is:

(A) $2^h - 1$ (B) $2^{h-1} - 1$ (C) $2^{h+1} - 1$ (D) 2^{h+1}

13. The maximum number of binary trees that can be formed with three unlabeled nodes is:

(A) 1 (B) 5 (C) 4 (D) 3

14. Which of the following sorting algorithms has the lowest worst-case complexity?

(A) Merge sort (B) Bubble sort (C) Quick sort (D) Selection sort

15. Consider the following segment of C-code:

```
int j, n;
   j = 1;
   while (j <=n)
       j = j*2;
```

The number of comparisons made in the execution of the loop for any n > 0 is:

(A) $\lceil \log_2 n \rceil + 1$ (B) n (C) $\lceil \log_2 n \rceil$ (D) $\lfloor \log_2 n \rfloor + 1$

16. Group 1 contains some CPU scheduling algorithms and Group 2 contains some applications. Match entries in Group 1 to entries in Group 2.

Group I	**Group II**
(P) Gang Scheduling	(1) Guaranteed Scheduling
(Q) Rate Monotonic Scheduling	(2) Real-time Scheduling
(R) Fair Share Scheduling	(3) Thread Scheduling

(A) P - 3 Q - 2 R - 1 (B) P - 1 Q - 2 R - 3
(C) P - 2 Q - 3 R - 1 (D) P - 1 Q - 3 R - 2

17. Consider the following statements about user level threads and kernel level threads. Which one of the following statements is FALSE?

(A) Context switch time is longer for kernel level threads than for user level threads.
(B) User level threads do not need any hardware support.
(C) Related kernel level threads can be scheduled on different processors in a multi-processor system.
(D) Blocking one kernel level thread blocks all related threads.

18. Which one of the following is a top-down parser?

(A) Recursive descent parser. (B) Operator precedence parser.
(C) An LR(k) parser. (D) An LALR(k) parser.

19. In Ethernet when Manchester encoding is used, the bit rate is:

(A) Half the baud rate. (B) Twice the baud rate.
(C) Same as the baud rate. (D) None of the above

20. Which one of the following uses UDP as the transport protocol?

(A) HTTP (B) Telnet (C) DNS (D) SMTP

Q.21 – Q.75 Carry Two Marks Each

21. How many different non-isomorphic Abelian groups of order 4 are there?

(A) 2 (B) 3 (C) 4 (D) 5

22. Let *Graph(x)* be a predicate which denotes that *x* is a graph. Let *Connected(x)* be a predicate which denotes that *x* is connected. Which of the following first order logic sentences DOES NOT represent the statement: *"Not every graph is connected"?*

(A) $\neg\forall x\left(Graph(x)\Rightarrow Connected(x)\right)$ (B) $\exists x\left(Graph(x)\wedge\neg Connected(x)\right)$

(C) $\neg\forall x\left(\neg Graph(x)\vee Connected(x)\right)$ (D) $\forall x\left(Graph(x)\Rightarrow\neg Connected(x)\right)$

23. Which of the following graphs has an Eulerian circuit?

(A) Any *k*-regular graph where *k* is an even number.

(B) A complete graph on 90 vertices.

(C) The complement of a cycle on 25 vertices.

(D) None of the above

24. Suppose we uniformly and randomly select a permutation from the 20! Permutations of 1, 2,3 ,…..,20. What is the probability that 2 appears at an earlier position than any other even number in the selected permutation?

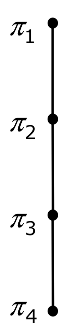
(A) $\frac{1}{2}$ (B) $\frac{1}{10}$ (C) $\frac{9!}{20!}$ (D) None of these

25. Let A be a 4 $\times$ 4 matrix with eigenvalues -5, -2, 1, 4. Which of the following is an eigenvalue of $\begin{bmatrix} A & I \\ I & A \end{bmatrix}$, where I is the 4 $\times$ 4 identity matrix?

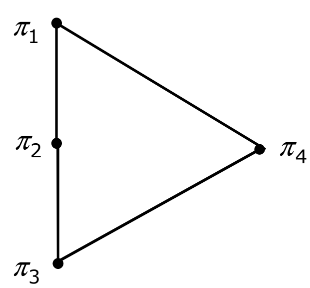
(A) -5 (B) -7 (C) 2 (D) 1

26. Consider the set $S=\{a,b,c,d\}$. Consider the following 4 partitions π_1,π_2,π_3,π_4 on $S:\pi_1=\{\overline{abcd}\},\pi_2=\{\overline{ab},\overline{cd}\},\pi_3=\{\overline{abc},\overline{d}\},\pi_4=\{\overline{a},\overline{b},\overline{c},\overline{d}\}$. Let p be the partial order on the set of partitions $S'=\{\pi_1,\pi_2,\pi_3,\pi_4\}$ defined as follows: π_i p π_j if and only if π_i refines π_j. The poset diagram for (S',p) is:

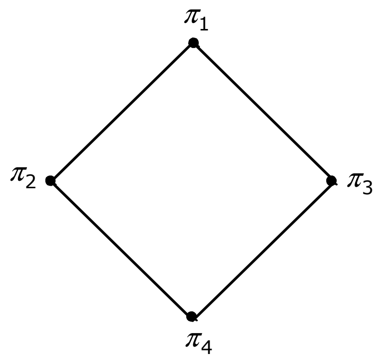
(A)



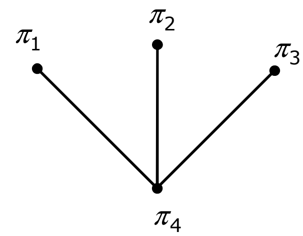
(B)



(C)



(D)



27. Consider the set of (column) vectors defined by $X = \left\{x \in R^3 \middle| x_1 + x_2 + x_3 = 0, \text{ where } x^T = [x_1, x_2, x_3]^T\right\}$. Which of the following is TRUE?

(A) $\left\{[1,-1,0]^T, [1,0,-1]^T\right\}$ is a basis for the subspace X.

(B) $\left\{[1,-1,0]^T, [1,0,-1]^T\right\}$ is a linearly independent set, but it does not span X and therefore is not a basis of X.

(C) X is not a subspace of R^3

(D) None of the above

28. Consider the series $x_{n+1} = \frac{x_n}{2} + \frac{9}{8x_n}, x_0 = 0.5$ obtained from the Newton-Raphson method. The series converges to

(A) 1.5 (B) $\sqrt{2}$ (C) 1.6 (D) 1.4

29. A minimum state deterministic finite automaton accepting the language $L = \left\{w \middle| w \in \{0,1\}^*, \text{ number of 0s and 1s in } w \text{ are divisible by 3 and 5, respectively}\right\}$ has

(A) 15 states (B) 11 states (C) 10 states (D) 9 states

30. The language $L = \left\{0^i 2 1^i \middle| i \geq 0\right\}$ over the alphabet $\{0,1,2\}$ is:

(A) not recursive

(B) is recursive and is a deterministic CFL.

(C) is a regular language.

(D) is not a deterministic CFL but a CFL.

31. Which of the following languages is regular?

(A) $\left\{ww^R \middle| w \in \{0,1\}^+\right\}$ (B) $\left\{ww^R x \middle| x, w \in \{0,1\}^+\right\}$

(C) $\left\{wxw^R \middle| x, w \in \{0,1\}^+\right\}$ (D) $\left\{xww^R \middle| x, w \in \{0,1\}^+\right\}$

32. Let $f(w,x,y,z) = \sum(0,4,5,7,8,9,13,15)$. Which of the following expressions are NOT equivalent to f ?

(P) $x'y'z' + w'xy' + wy'z + xz$

(Q) $w'y'z' + wx'y' + xz$

(R) $w'y'z' + wx'y' + xyz + xy'z$

(S) $x'y'z' + wx'y' + w'y$

(A) P only (B) Q and S (C) R and S (D) S only

33. Define the connective * for the Boolean variables X and Y as: X * Y = XY + $X'Y'$. Let $Z = X * Y$. Consider the following expressions P, Q and R.

$\pi P : X = Y * Z$ $Q : Y = X * Z$ $R : X * Y * Z = 1$

Which of the following is TRUE?

(A) Only P and Q are valid. (B) Only Q and R are valid.

(C) Only P and R are valid. (D) All P, Q, R are valid.

34. Suppose only one multiplexer and one inverter are allowed to be used to implement any Boolean function of n variables. What is the minimum size of the multiplexer needed?

(A) 2^n line to 1 line (B) 2^{n+1} line to 1 line

(C) 2^{n-1} line to 1 line (D) 2^{n-2} line to 1 line

35. In a look-ahead carry generator, the carry generate function G_i and the carry propagate function P_i for inputs A_i and B_i are given by:

$P_i = A_i \oplus B_i$ and $G_i = A_i B_i$

The expressions for the sum bit S_i and the carry bit C_{i+1} of the look-ahead carry adder are given by:

$S_i = P_i \oplus C_i$ and $C_{i+1} = G_i + P_i C_i$, where C_0 is the input carry.

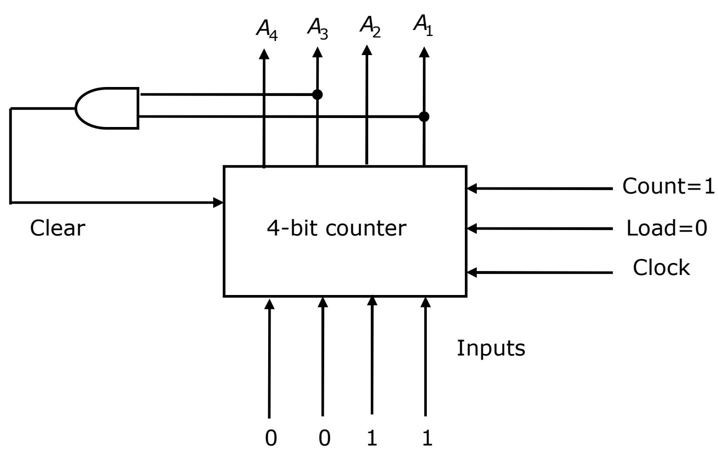
Consider a two-level logic implementation of the look-ahead carry generator. Assume that all P_i and G_i are available for the carry generator circuit and that the AND and OR gates can have any number of inputs. The number of AND gates and OR gates needed to implement the look-ahead carry generator for a 4-bit adder with S_3, S_2, S_1, S_0 and C_4 as its outputs are respectively:

(A) 6, 3 (B) 10, 4 (C) 6, 4 (D) 10, 5

36. The control signal functions of a 4-bit binary counter are given below (where X is "don't care"):

Clear	Clock	Load	Count	Function
1	X	X	X	Clear to 0
0	X	0	0	No change
0	↑	1	X	Load input
0	↑	0	1	Count next

The counter is connected as follows:



Assume that the counter and gate delays are negligible. If the counter starts at 0, then it cycles through the following sequence:

(A) 0, 3, 4
(B) 0, 3, 4, 5
(C) 0, 1, 2, 3, 4
(D) 0, 1, 2, 3, 4, 5

37. Consider a pipelined processor with the following four stages:

IF: Instruction Fetch

ID: Instruction Decode and Operand Fetch

EX: Execute

WB: Write Back

The IF, ID and WB stages take one clock cycle each to complete the operation. The number of clock cycles for the EX stage depends on the instruction. The ADD and SUB instructions need 1 clock cycle and the MUL instruction needs 3 clock cycles in the EX stage. Operand forwarding is used in the pipelined processor. What is the number of clock cycles taken to complete the following sequence of instructions?

ADD	R2, R1, R0	R2 ← R1 + R0
MUL	R4, R3, R2	R4 ← R3 * R2
SUB	R6, R5, R4	R6 ← R5 – R4

(A) 7 (B) 8 (C) 10 (D) 14

38. The following postfix expression with single digit operands is evaluated using a stack:

8 2 3 ^ / 2 3 * + 5 1 * -

Note that ^ is the exponentiation operator. The top two elements of the stack after the first * is evaluated are:

(A) 6, 1 (B) 5, 7 (C) 3, 2 (D) 1, 5

39. The inorder and preorder traversal of a binary tree are

`d b e a f c g` and `a b d e c f g`, respectively

The postorder traversal of the binary tree is:

(A) d e b f g c a (B) e d b g f c a (C) e d b f g c a (D) d e f g b c a

40. Consider a hash table of size seven, with starting index zero, and a hash function $(3x + 4) \bmod 7$. Assuming the hash table is initially empty, which of the following is the contents of the table when the sequence 1, 3, 8, 10 is inserted into the table using closed hashing? Note that – denotes an empty location in the table.

(A) 8, –, –, –, –, –, 10
(B) 1, 8, 10, –, –, –, 3
(C) 1, –, –, –, –, –, 3
(D) 1, 10, 8, –, –, –, 3

41. In an unweighted, undirected connected graph, the shortest path from a node S to every other node is computed most efficiently, in terms of *time complexity,* by

(A) Dijkstra's algorithm starting from S.
(B) Warshall's algorithm
(C) Performing a DFS starting from S.
(D) Performing a BFS starting from S.

42. Consider the following C function:

```
int f(int n)
{static int r = 0;
 if (n <= 0) return 1;
  if (n > 3)
     {r = n;
      return f(n-2)+2;
     }
  return f(n-1)+r;
}
```

What is the value of $f(5)$?

(A) 5 (B) 7 (C) 9 (D) 18

43. A complete n-ary tree is a tree in which each node has n children or no children. Let I be the number of internal nodes and L be the number of leaves in a complete n-ary tree. If $L = 41$, and $I = 10$, what is the value of n?

(A) 3 (B) 4 (C) 5 (D) 6

44. In the following C function, let $n \geq m$.

```
int gcd(n,m)
 {
    if (n%m ==0) return m;
       n = n%m;
    return gcd(m,n);
 }
```

How many recursive calls are made by this function?

(A) $\Theta(\log_2 n)$ (B) $\Omega(n)$ (C) $\Theta(\log_2 \log_2 n)$ (D) $\Theta(\sqrt{n})$

45. What is the time *complexity* of the following recursive function:

```
int DoSomething (int n) {
    if (n <= 2)
        return 1;
    else
        return (DoSomething (floor(sqrt(n))) + n);
}
```

(A) $\Theta(n^2)$ (B) $\Theta(n \log_2 n)$ (C) $\Theta(\log_2 n)$ (D) $\Theta(\log_2 \log_2 n)$

46. Consider the following C program segment where CellNode represents a node in a binary tree:

```
struct CellNode  {
   struct CellNOde *leftChild;
     int element;
   struct CellNode *rightChild;
};
int GetValue (struct CellNode *ptr)  {
  int value = 0;
  if (ptr != NULL)                {
     if ((ptr->leftChild == NULL) &&
           (ptr->rightChild == NULL))
        value = 1;
else
        value = value + GetValue(ptr->leftChild)
```

```
                                  + GetValue(ptr->rightChild);
    }
return(value);
}
```

The value returned by GetValue when a pointer to the root of a binary tree is passed as its argument is:

(A) the number of nodes in the tree

(B) the number of internal nodes in the tree

(C) the number of leaf nodes in the tree

(D) the height of the tree

47. Consider the process of inserting an element into a *Max Heap*, where the *Max Heap* is represented by an *array*. Suppose we perform a binary search on the path from the new leaf to the root to find the position for the newly inserted element, the number of *comparisons* performed is:

(A) $\Theta(\log_2 n)$ (B) $\Theta(\log_2 \log_2 n)$ (C) $\Theta(n)$ (D) $\Theta(n \log_2 n)$

48. Which of the following is TRUE about formulae in Conjunctive Normal Form?

(A) For any formula, there is a truth assignment for which at least half the clauses evaluate to true.

(B) For any formula, there is a truth assignment for which all the clauses evaluate to true.

(C) There is a formula such that for each truth assignment, at most one-fourth of the clauses evaluate to true.

(D) None of the above.

49. Let w be the minimum weight among all edge weights in an undirected connected graph. Let e be a specific edge of weight w. Which of the following is FALSE?

(A) There is a minimum spanning tree containing e.

(B) If e is not in a minimum spanning tree T, then in the cycle formed by adding e to T, all edges have the same weight.

(C) Every minimum spanning tree has an edge of weight w.

(D) e is present in every minimum spanning tree.

50. An array of n numbers is given, where n is an even number. The maximum as well as the minimum of these n numbers needs to be determined. Which of the following is TRUE about the number of comparisons needed?

(A) At least $2n - c$ comparisons, for some constant c, are needed.

(B) At most $1.5n - 2$ comparisons are needed.

(C) At least $n \log_2 n$ comparisons are needed.

(D) None of the above.

51. Consider the following C code segment:

```
int IsPrime(n)
      {
        int i,n;
        for(i=2;i<=sqrt(n);i++)
          if(n%i == 0)
            {printf("Not Prime\n"); return 0;}
        return 1;
       }
```

Let $T(n)$ denote the number of times the *for* loop is executed by the program on input *n.* Which of the following is TRUE?

(A) $T(n) = O(\sqrt{n})$ and $T(n) = \Omega(\sqrt{n})$
(B) $T(n) = O(\sqrt{n})$ and $T(n) = \Omega(1)$
(C) $T(n) = O(n)$ and $T(n) = \Omega(\sqrt{n})$
(D) None of the above

52. Consider the grammar with non-terminals $N = \{S, C, S_1\}$, terminals $T = \{a, b, i, t, e\}$, with S as the start symbol, and the following set of rules:

$$S \to iCtSS_1 \mid a$$
$$S_1 \to eS \mid \varepsilon$$
$$C \to b$$

The grammar is NOT LL(1) because:

(A) it is left recursive
(B) it is right recursive
(C) it is ambiguous
(D) it is not context-free.

53. Consider the following two statements:

P: Every regular grammar is LL(1)

Q: Every regular set has a LR(1) grammar

Which of the following is TRUE?

(A) Both P and Q are true
(B) P is true and Q is false
(C) P is false and Q is true
(D) Both P and Q are false

54. In a simplified computer the instructions are:

OP R_j, R_i - Performs R_j OP R_i and stores the result in register R_i.

OP m, R_i - Performs *val* OP R_i and stores the result in R_i. *val* denotes the content of memory location *m.*

MOV m, R_i - Moves the content of memory location *m* to register R_i.

MOV R_i, m - Moves the content of register R_i to memory location *m.*

The computer has only to registers, and OP is either ADD or SUB. Consider the following basic block:

$t_1 = a + b$
$t_2 = c + d$
$t_3 = e - t_2$
$t_4 = t_1 - t_3$

Assume that all operands are initially in memory. The final value of the computation should be in memory. What is the minimum number of MOV instructions in the code generated for this basic block?

(A) 2 (B) 3 (C) 5 (D) 6

55. An operating system uses Shortest Remaining Time first (SRT) process scheduling algorithm. Consider the arrival times and execution times for the following processes:

Process	Execution time	Arrival time
P1	20	0
P2	25	15
P3	10	30
P4	15	45

What is the total waiting time for process P2?

(A) 5 (B) 15 (C) 40 (D) 55

56. A virtual memory system uses First In First Out (FIFO) page replacement policy and allocates a fixed number of frames to a process. Consider the following statements:

P: Increasing the number of page frames allocated to a process sometimes increases the page fault rate.

Q: Some programs do not exhibit locality of reference.

Which one of the following is TRUE?

(A) Both P and Q are true, and Q is the reason for P

(B) Both P and Q are true, but Q is not the reason for P.

(C) P is false, but Q is true

(D) Both P and Q are false.

57. A single processor system has three resource types X, Y and Z, which are shared by three processes. There are 5 units of each resource type. Consider the following scenario, where the column ***alloc*** denotes the number of units of each resource type allocated to each process, and the column ***request*** denotes the number of units of each resource type requested by a process in order to complete execution. Which of these processes will finish **LAST**?

	alloc			request		
	X	Y	Z	X	Y	Z
P0	1	2	1	1	0	3
P1	2	0	1	0	1	2
P2	2	2	1	1	2	0

(A) P0 (B) P1 (C) P2

(D) None of the above, since the system is in a deadlock.

58. Two processes, P1 and P2, need to access a critical section of code. Consider the following synchronization construct used by the processes:

```
/*      P1     */
while (true)   {
     wants1 = true;
     while (wants2==true);
     /* Critical
        Section   */
     wants1=false;
}
/*  Remainder section  */
```

```
/*      P2     */
while (true)   {
     wants2 = true;
     while (wants1==true);
     /* Critical
        Section   */
     Wants2=false;
}
/*  Remainder section  */
```

Here, `wants1` and `wants2` are shared variables, which are initialized to `false`.

Which one of the following statements is **TRUE** about the above construct?

(A) It does not ensure mutual exclusion.

(B) It does not ensure bounded waiting.

(C) It requires that processes enter the critical section in strict alternation.

(D) It does not prevent deadlocks, but ensures mutual exclusion.

59. Information about a collection of students is given by the relation **studinfo**(<u>studId,</u> name, sex). The relation **enroll**(<u>studId, courseId</u>) gives which student has enrolled for (or taken) what course(s). Assume that every course is taken by at least one male and at least one female student. What does the following relational algebra expression represent?

$$\Pi_{\text{courseId}}\left(\left(\Pi_{\text{studId}}\left(\sigma_{sex=\text{"female"}}\left(\text{studInfo}\right)\right)\times\Pi_{\text{courseId}}\left(\text{enroll}\right)\right)-\text{enroll}\right)$$

(A) Courses in which all the female students are enrolled.

(B) Courses in which a proper subset of female students are enrolled.

(C) Courses in which only male students are enrolled.

(D) None of the above

60. Consider the relation **employee**(name, sex, supervisorName) with *name* as the key. *supervisorName* gives the name of the supervisor of the employee under consideration. What does the following Tuple Relational Calculus query produce?

$$\{\text{e.name} \mid \text{employee}(\text{e}) \wedge$$

$$(\forall x)\left[\neg\text{employee}(\text{x}) \vee x.\text{supervisorName} \neq \text{e.name} \;\vee\; \text{x.sex} = \text{"male"}\right]\}$$

(A) Names of employees with a male supervisor.

(B) Names of employees with no immediate male subordinates.

(C) Names of employees with no immediate female subordinates.

(D) Names of employees with a female supervisor.

61. Consider the table **employee**(empId, name, department, salary) and the two queries Q_1, Q_2 below. Assuming that department 5 has more than one employee, and we want to find the employees who get higher salary than anyone in the department 5, which one of the statements is **TRUE** for any arbitrary employee table?

Q_1 : Select e.empId

From employee e

Where not exists

(Select * From employee s where s.department = "5" and s.salary >=e.salary)

Q_2 : Select e.empId

From employee e

Where e.salary > Any

(Select distinct salary From employee s Where s.department = "5")

(A) Q_1 is the correct query

(B) Q_2 is the correct query

(C) Both Q_1 and Q_2 produce the same answer.

(D) Neither Q_1 nor Q_2 is the correct query

62. Which one of the following statements if **FALSE?**

(A) Any relation with two attributes is in BCNF

(B) A relation in which every key has only one attribute is in 2NF

(C) A prime attribute can be transitively dependent on a key in a 3 NF relation.

(D) A prime attribute can be transitively dependent on a key in a BCNF relation.

63. The order of a leaf node in a B^+-tree is the maximum number of (value, data record pointer) pairs it can hold. Given that the block size is 1K bytes, data record pointer is 7 bytes long, the value field is 9 bytes long and a block pointer is 6 bytes long, what is the order of the leaf node?

(A) 63 (B) 64 (C) 67 (D) 68

64. Consider the following schedules involving two transactions. Which one of the following statements is **TRUE**?

$S_1 : r_1(X); r_1(Y); r_2(X); r_2(Y); w_2(Y); w_1(X)$

$S_2 : r_1(X); r_2(X); r_2(Y); w_2(Y); r_1(Y); w_1(X)$

(A) Both S_1 and S_2 are conflict serializable.

(B) S_1 is conflict serializable and S_2 is not conflict serializable.

(C) S_1 is not conflict serializable and S_2 is conflict serializable.

(D) Both S_1 and S_2 are not conflict serializable.

65. There are n stations in a slotted LAN. Each station attempts to transmit with a probability p in each time slot. What is the probability that **ONLY** one station transmits in a given time slot?

(A) $np(1-p)^{n-1}$ (B) $(1-p)^{n-1}$ (C) $p(1-p)^{n-1}$ (D) $1-(1-p)^{n-1}$

66. In a token ring network the transmission speed is 10^7 bps and the propagation speed is 200 metres/μs. The 1-bit delay in this network is equivalent to:

(A) 500 metres of cable. (B) 200 metres of cable.

(C) 20 metres of cable. (D) 50 metres of cable.

67. The address of a class B host is to be split into subnets with a 6-bit subnet number. What is the maximum number of subnets and the maximum number of hosts in each subnet?

(A) 62 subnets and 262142 hosts. (B) 64 subnets and 262142 hosts.

(C) 62 subnets and 1022 hosts. (D) 64 subnets and 1024 hosts.

68. The message 11001001 is to be transmitted using the CRC polynomial x^3+1 to protect it from errors. The message that should be transmitted is:

(A) 11001001000 (B) 11001001011

(C) 11001010 (D) 110010010011

69. The distance between two stations M and N is L kilometers. All frames are K bits long. The propagation delay per kilometer is t seconds. Let R bits/second be the channel capacity. Assuming that processing delay is negligible, the *minimum* number of bits for the sequence number field in a frame for maximum utilization, when the *sliding window protocol* is used, is:

(A) $\left\lceil \log_2 \frac{2LtR+2K}{K} \right\rceil$ (B) $\left\lceil \log_2 \frac{2LtR}{K} \right\rceil$

(C) $\left\lceil \log_2 \frac{2LtR+K}{K} \right\rceil$ (D) $\left\lceil \log_2 \frac{2LtR+K}{2K} \right\rceil$

70. Match the following:

(P) SMTP	(1) Application layer
(Q) BGP	(2) Transport layer
(R) TCP	(3) Data link layer
(S) PPP	(4) Network layer
	(5) Physical layer

(A) P - 2 Q - 1 R - 3 S - 5
(B) P - 1 Q - 4 R - 2 S - 3
(C) P - 1 Q - 4 R - 2 S - 5
(D) P - 2 Q - 4 R - 1 S - 3

Common Data Questions

Common Data for Questions 71, 72, 73:
Consider the following program segment. Here R1, R2 and R3 are the general purpose registers.

	Instruction	Operation	Instruction size (no.of words)
	MOV R1, (3000)	R1 ← m[3000]	2
LOOP:	MOV R2, (R3)	R2 ← M[R3]	1
	ADD R2, R1	R2 ← R1 + R2	1
	MOV (R3), R2	M[R3] ← R2	1
	INC R3	R3 ← R3 + 1	1
	DEC R1	R1 ← R1 − 1	1
	BNZ LOOP	Branch on not zero	2
	HALT	Stop	1

Assume that the content of memory location 3000 is 10 and the content of the register R3 is 2000. The content of each of the memory locations from 2000 to 2010 is 100. The program is loaded from the memory location 1000. All the numbers are in decimal.

71. Assume that the memory is word addressable. The number of memory references for accessing the data in executing the program completely is:

(A) 10 (B) 11 (C) 20 (D) 21

72. Assume that the memory is word addressable. After the execution of this program, the content of memory location 2010 is:

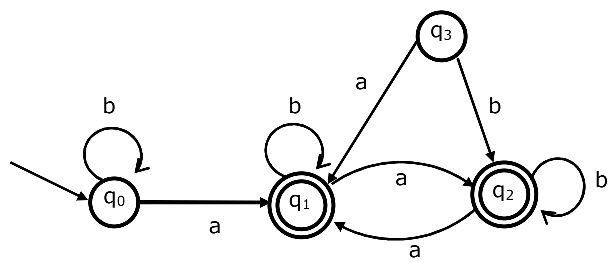
(A) 100 (B) 101 (C) 102 (D) 110

73. Assume that the memory is byte addressable and the word size is 32 bits. If an interrupt occurs during the execution of the instruction "INC R3", what return address will be pushed on to the stack?

(A) 1005 (B) 1020 (C) 1024 (D) 1040

Common Data for Questions 74, 75:

Consider the following Finite State Automaton:



74. The language accepted by this automaton is given by the regular expression

(A) $b^*ab^*ab^*ab^*$ (B) $(a+b)^*$ (C) $b^*a(a+b)^*$ (D) $b^*ab^*ab^*$

75. The minimum state automaton equivalent to the above FSA has the following number of states

(A) 1 (B) 2 (C) 3 (D) 4

Linked Answer Questions: Q.76 to Q.85 Carry Two Marks Each

Statement for Linked Answer Questions 76 & 77:

Suppose the letters *a, b, c, d, e, f* have probabilities $\frac{1}{2},\frac{1}{4},\frac{1}{8},\frac{1}{16},\frac{1}{32},\frac{1}{32}$, respectively.

76. Which of the following is the Huffman code for the letter *a, b, c, d, e, f?*

(A) 0, 10, 110, 1110, 11110, 11111

(B) 11, 10, 011, 010, 001, 000

(C) 11, 10, 01, 001, 0001, 0000

(D) 110, 100, 010, 000, 001, 111

77. What is the average length of the correct answer to Q.76?

(A) 3 (B) 2.1875 (C) 2.25 (D) 1.9375

Statement for Linked Answer Questions 78 & 79:

Consider the CFG with $\{S,A,B\}$ as the non-terminal alphabet, $\{a,b\}$ as the terminal alphabet, S as the start symbol and the following set of production rules:

$$\begin{array}{ll} S \to aB & S \to bA \\ B \to b & A \to a \\ B \to bS & A \to aS \\ B \to aBB & S \to bAA \end{array}$$

78. Which of the following strings is generated by the grammar?
    (A) aaaabb (B) aabbbb (C) aabbab (D) abbbba

79. For the correct answer strings to Q.78, how many derivation trees are there?
    (A) 1 (B) 2 (C) 3 (D) 4

Statement for Linked Answer Questions 80 & 81:

Consider a machine with a byte addressable main memory of 2^{16} bytes. Assume that a direct mapped data cache consisting of 32 lines of 64 bytes each is used in the system. A 50×50 two-dimensional array of bytes is stored in the main memory starting from memory location 1100H. Assume that the data cache is initially empty. The complete array is accessed twice. Assume that the contents of the data cache do not change in between the two accesses.

80. How many data cache misses will occur in total?
    (A) 48 (B) 50 (C) 56 (D) 59

81. Which of the following lines of the data cache will be replaced by new blocks in accessing the array for the second time?
    (A) line 4 to line 11 (B) line 4 to line 12
    (C) line 0 to line 7 (D) line 0 to line 8

Statement for Linked Answer Questions 82 & 83:

A process has been allocated 3 page frames. Assume that none of the pages of the process are available in the memory initially. The process makes the following sequence of page references (reference string): **1, 2, 1, 3, 7, 4, 5, 6, 3, 1**

82. If optimal page replacement policy is used, how many page faults occur for the above reference string?
    (A) 7 (B) 8 (C) 9 (D) 10

83. Least Recently Used (LRU) page replacement policy is a practical approximation to optimal page replacement. For the above reference string, how many more page faults occur with LRU than with the optimal page replacement policy?
    (A) 0 (B) 1 (C) 2 (D) 3

Statement for Linked Answer Questions 84 & 85:

Suppose that a robot is placed on the Cartesian plane. At each step it is allowed to move either one unit up or one unit right, i.e., if it is at (i, j) then it can move to either $(i+1, j)$ or $(i, j+1)$.

84. How many distinct paths are there for the robot to reach the point (10,10) starting from the initial position (0,0)?

(A) $\binom{20}{10}$ (B) 2^{20}

(C) 2^{10} (D) None of the above

85. Suppose that the robot is not allowed to traverse the line segment from (4,4) to (5,4). With this constraint, how many distinct paths are there for the robot to reach (10,10) starting from (0,0)?

(A) 2^{9} (B) 2^{19}

(C) $\binom{8}{4} \times \binom{11}{5}$ (D) $\binom{20}{10} - \binom{8}{4} \times \binom{11}{5}$
